Mr. Serjeant Cox, of England, was of opinion that there was a wide difference, morally speaking, between the man who committed a crime of violence under sudden passion and the habitual thief. The former was frequently far more severely punished than the latter, although his offense did not, of itself, indicate great moral depravity. He thought it monstrous that the two should be treated precisely alike in prison. A classification which only recognized these two categories, would be better than none.

Dr. Bittinger, of Pennsylvania, pointed out that the necessity for classification of some sort had always been recognized—first, in the separation of different sexes and different ages, and afterward in the construction of prisons for offenses of various grades. He thought, with Mr. Cox, that the man who had committed a crime in hot blood, or while intoxicated, and the habitual criminal ought not to be treated

alike in prison. The latter was hopeless, crime being his profession; while the former might be the victim of misfortune. A sense of justice was essential to reform; and if they were put on the same footing, the pick-pocket would despise justice, while the other would resent being made a felon. An employer knew the character of his men, and he believed that a prison officer might judge of the moral character of his prisoners by the same standard, *i. e.*, their actions.

Colonel Ratcliffe, of England, while admitting that classification was impossible in prisons where the sentences were for a few weeks or months, thought it practicable in convict-prisons where the sentences were of long duration.

Baron von Holtzendorff, of Prussia, said that M. d'Alinge's practical experience had refuted the allegation of impossibility. Isolation and the cellular system had arisen from the alleged impossibility of classification, but the progressive system involved classification, and the problem had been solved by Germany and, to a certain extent, by Sir W. Crofton's system. The mark system was a self-acting method of classification according to behavior. God alone could gauge the inner man, but the outer man could be tested by behavior and industry. If he played the hypocrite, he must be left to God.

§ 3. *Prison management—how far to be regulated by legislation.*—The discussion on this question was opened by Mr. Stevens, of Belgium. He thought that prisons should be placed under the direction of a central authority. The regulations of the public administration should determine the prison administration, the mode of surveillance, and the moral and material treatment to be adopted in conformity with the law; but a certain latitude should be left to the executive authority, making obligatory, however, a due regard for the principles fixed by the law. When prison treatment is not regulated by law, this latitude is too large and extremely liable to abuse.

Baron Mackay, of Holland, agreed with Mr. Stevens that the general principles of prison discipline should be laid down by legislation, but thought that, in view of the rapid advances made in this science, it would be unwise to attempt to prescribe details, which, when fixed by statute, could not be easily altered.

Mr. Frederic Hill, of England, said that the plan suggested by Mr. Stevens had been adopted in Scotland. Under the Scotch system all details were left to the authorities in charge of the prison, who were thus enabled to make such changes, from time to time, as experience might suggest. He thought that the English system fettered the prison officials too much. There should, however, always be some one directly responsible to government for the working of the regulations adopted in each prison.

Dr. Mouat said that the Indian system approximated to the Scotch. Minute rules should not be embodied in acts of Parliament, but left to experienced authorities, to be altered whenever it might become necessary.

Baron von Holtzendorff said that the criminal code of Germany had formerly given only the names of different kinds of punishment, but the Reichstag had asked the government to frame a rule defining each kind of imprisonment. In Germany, and especially in Prussia, all regulations for local prisons emanated from the government. There was, consequently, great uniformity, and no such difference could exist as prevailed in England between jails and convict-prisons. Some prison governors had no confidence in any system but their own, and it was necessary to put some restraint on them. The question whether or not

corporal punishment ought to be inflicted should be determined by the legislature, and not left, as in Germany, to the discretion of the governor. The maximum and minimum of severity should also be laid down by law, but the application—the determining what degree of severity to inflict—should be left to the authorities.

Mr. Beltrani-Scalia, of Italy, said that in that country, for a long time past, the law had laid down principles and left the mode of executing them to the authorities.

Mr. Hastings, of England, objected to any attempt to obtain the benefit of a uniform system by sacrificing local action. He considered diversity of experiment the only way of arriving at the best treatment. It was impossible to say what was the best system of prison administration under all circumstances, in all countries, or even in all parts of the same country. The legislature should lay down certain broad principles, but within those limits entire liberty should be left to local administration. Under a stereotyped system, which fettered the administrators, its faults—and there would certainly be some—would be without hope of remedy; whereas, by leaving room for experiment and diversity of action, a much better system would ultimately be reached.

Mr. Berden, of Belgium, said that in that country a special law, a modification of the Code Napoléon, laid down the principles of prison administration, but left sufficient discretion to prison authorities to deal with individuals as circumstances might dictate. Thus, although most of the prisons were being adapted to the cellular system, which system was favored by the legislature, prisoners who from ill-health or other causes were unfit for the cellular system were not subjected to it.

§ 4. *Whether whipping should be employed as a disciplinary punishment.*—Mr. Stevens was of opinion that it should not. Its tendency was to brutalize the prisoner, and thus neutralize the reformatory influences that should be brought to bear upon him. He deprecated the use of physical punishment of all kinds, believing that moral means were all-sufficient, if properly applied. The bastinado can never open the way to the heart. Such punishments, in the words of a French workman, affect only the prisoner's *hide*, while degrading him to the level of the brute. In Belgium, any prison official who had resort to the lash would be promptly dismissed from his post. It should never be forgotten that imprisonment is but a severe, though benevolent, means to the accomplishment of the prisoner's reformation. Experience has proved that good discipline can be maintained without frequent recourse to punishments, and that many prisoners are led to obedience by the moderation and justice displayed toward them by the administration. The idea that prisoners can be governed only by severity proceeds upon the mistaken belief that they are forever lost as regards an honest life. Such a belief overlooks the relation subsisting between crime on the one side and ignorance and parental neglect on the other, and those who employ such chastisement as leaves in the heart only sentiments of hatred and vengeance may justly be held responsible for the neglect of those moral and religious influences, which alone are able to lead men to obedience and duty.

Major Du Cane, director of English convict prisoners, believed that prisoners were persons whom discipline must reduce to a proper frame of mind. He believed it would be impossible to preserve discipline and protect the officers—a few men amid large bodies of prisoners, many of turbulent dispositions—without the fear of corporal punishment. He had himself known prisoners to acknowledge that but for flogging they would not have become tractable and reformed characters.

Dr. Mouat said that in Indian prisons, owing to their imperfect construction, the cane had been much more largely employed than the sugar extracted from it. Its infliction should, in his opinion, be restricted to cases where convicts were so degraded and brutalized that the lash alone would compel them to good behavior; but, while agreeing that moral means should be pushed to the utmost, he would still, in jealously-guarded cases, retain the power, in the hope that this would render its exercise unnecessary.

Mr. Shepherd, for thirty years governor of the Wakefield prison, England, with an average of one thousand inmates, stated that during all that time no corporal punishment was inflicted there for prison offenses. He doubted whether in cases where it was inflicted every other means had first been tried. He favored its entire abolition. Up to his resignation (six years ago) he had remarked that nearly every prisoner subjected to corporal punishment returned to the prison again.

Dr. Marquardsen, of Bavaria, said that in his country corporal punishment had been abandoned several years ago, both as a means of public punishment and as an agency of prison discipline. The respect and obedience shown by prisoners had since greatly increased, breaches of discipline had diminished, and no prison authority desired a revival of the practice. The committee of the Reichstag, of which he had been a member, charged with the framing of a military code for Germany, had also set aside corporal punishment, so that not a blow could be struck in the whole empire.

Dr. Frey, as the governor of a prison with many hundred inmates, said that in Austria the use of the lash was abolished in 1866, experience having shown that it was demoralizing. It deprived the prisoner of that self-esteem which formed the basis of his moral improvement, and the strictest discipline might be maintained by other means.

Dr. Guillaume, of Switzerland, said it was also being abolished in his country.

Major Fulford, governor of the jail in Staffordshire, England, said that he was required to be present at every infliction of corporal punishment in his prison, and that he was invariably ill in consequence. Still, he believed it impossible to dispense with it in a prison where, as was the case with his, the prisoners were thoroughly degraded and vicious. There was a class of men who thought nothing of disgrace, but cared only for the stripes that they received.

Mr. Wills, governor of Nottingham prison, England, agreed with Major Fulford that flogging, though it should rarely be administered, was a useful power in reserve.

Mrs. Julia Ward Howe, of Massachusetts, thought the only thing to be said for flogging was that it was a time-saving process. Reason would gain as much in time. She was sure that no brutally ill-treated woman would thank the prison officials for sending her husband home more brutalized than before. She would never say to any prisoner, "You are a brute?" Rather would she say, "You are God's child; do not dishonor His image, as I cannot, no matter what have been your faults, dishonor it in you."

Mr. Frederic Hill said that for seven years, while he was inspector of prisons in Scotland, no corporal inflictions were allowed, nor did he hear any prison governor express a wish for the power to inflict such chastisement.

Mr. Hastings, of England, was glad to say that it had not been found necessary to use the lash in the county prison of which he was a visiting justice.

Sir Walter Crofton said that Englishmen generally favored the retention of the power of corporal punishment, in order that the necessity might never arise for its exercise. Prison governors had not the power of enforcing discipline by this means, which could be employed only on magisterial sanction. Its use was very exceptional, and resort was never had to it, until every other resource had been exhausted. In countries which had abolished flogging in prison, other punishments were employed, and if an unobjectionable substitute could be found for England, he would be rejoiced to hear of it. Every magistrate and prison governor had a horror of it, but all clung to the necessity of retaining the power to inflict it.

General Pilsbury, of New York, said he was no advocate of corporal punishment. He knew from experience, however, that all prisoners could not be governed by moral suasion; a few require severer discipline. He was convinced that no prison could be well and safely governed, unless ample power were vested in the chief officer to inflict special punishment, when called for, promptly, summarily, and, if need be, severely. He was of opinion, however, that this power should be given to the chief officer alone, and that not through the intervention of an advisory board. If prisoners knew that he possessed such a power, occasion for punishment would seldom arise; the knowledge would prove sufficient of itself to enforce discipline.

Dr. Marquardsen, of Bavaria, thought that the actual experience of what had been accomplished without the power to inflict corporal punishment furnished a stronger argument than the alleged maintenance of discipline by the existence of power which was seldom exercised. Such a method of reasoning he could not accept.

§ 5. *Kinds and limits of instruction suited to the reformatory treatment of prisoners.*—Mr. Stevens, of Belgium, opened the discussion by saying that the means of moral influence should consist chiefly in education, which should be of a quadruple character: industrial, scholastic, moral, and religious.

1. *Industrial education.*—The object of this part of his education is to provide the prisoner with the means of earning a livelihood on his discharge. Consequently, in the work-shops, more care should be taken to teach him his trade thoroughly than to make his labor productive. The primary object of labor, as an element of prison discipline, is to reform the prisoner and aid him to lead a reformed life on his discharge; hence it should be organized and conducted with a view rather to the future of the prisoner than to its effect upon the treasury.

2. *Scholastic instruction.*—This should comprise reading, writing, arithmetic, the elements of grammar, history, geography, geometry, and linear drawing, the latter especially in reference to trades and useful arts. The fact that public instruction has received so great an extension within the last few years renders it all the more important that a vigorous impulse be given to primary instruction in prisons. Illiterate persons should be the object of special care.

3. *Moral education.*—The teacher should, by special instruction in the school, inculcate the performance of social duties. This instruction should review the principal existing vices of society and demonstrate their sad and shameful consequences. Alternately the teaching should be based on the virtue opposed to the particular vice discussed at the preceding lesson, and should set forth as well its inherent beauty as the moral and material advantages associated with its exercise. Other lessons should be given on the most frequent violations of the penal code, especially noting such crimes as robbery, swindling, rape, assault, mur-

der, &c. In all moral instruction, an effort should be made to develop the sentiments of justice, family affection, and patriotism.

4. *Religious education.*—By this is understood the *special* religious instruction given by the ministers of each faith to the prisoners attached to it who are ignorant of the essential truths of religion. The use of the word *special* in describing this part of the prisoner's education signified that such instruction should be entirely independent of the religious instruction given by the chaplain to the prisoners in general. The sentiment of religion should be always deemed the last and strongest influence in a penitentiary education.

Mr. Tallack, of England, said that the prisons act, passed by Parliament in 1865, subordinated moral and religious instruction, which he believed to be an unsound principle. He deplored the small attention which was paid to convict education in the prisons of the United Kingdom.

Mr. Merry, a Berkshire magistrate, deprecated the pursuit of industrial labor to the exclusion of a proper attention to education, maintaining that silent congregate labor left the head empty and the heart hard.

Mr. McFarlane, of England, said that every care was taken in the Irish prisons to provide, first, for religious and then for industrial and literary instruction. He was surprised to hear Mr. Tallack arraign the prisons of Ireland on the score of neglect in this particular.

Dr. Varrentrap, of Germany, thought that secular should include physical education, since the mental and moral equilibrium depended so largely on the *physique*. He believed that no limit should be placed on secular instruction, and favored the task-system of labor as affording the prisoner a better opportunity for study.

Miss Mary Carpenter, of England, thought that society was bound to cultivate the powers God had given to a prisoner, and so enable him the better to discharge his duties as a prisoner and a man, and the difficulty attending the education of adults should form no obstacle. She regretted that government did not recognize this duty. Instruction should be so imparted as to be in itself a pleasure, and its influence would then be most salutary, as tending to wean prisoners from the indulgence of their lower passions. Scholastic, moral, and religious instructions were closely allied, and should not be separated.

§ 6. *Whether it is expedient in certain cases to employ an imprisonment consisting in mere privation of liberty without obligation to work.*—Count de Foresta, of Italy, thought that crimes of passion, not implying great moral perversity, should not be punished by ordinary imprisonment, but by simple detention in a fortress or other secure place, without the prisoner being required to labor, and without association with those sentenced to ordinary imprisonment. The natural distinction between crimes of passion and of reflection seemed to indicate the propriety of making a difference between the punishments awarded them. Crimes of the former category are frequently committed by persons who are young, well educated, and uncorrupted. For such prisoners he considered the solitude of a cell, with forced labor, merely an aggravation of punishment, and not calculated to have a reformatory influence. He believed that simple detention, with the privilege of reading, attending to their own affairs, and seeing friends, was a sufficient punishment. What descriptions of criminals should be treated in this manner should be determined by the penal code.

Professor Wladrinoff, of Russia, remarked that simple infractions of the law did not involve criminality. He thought it should be left to the

jury to decide to which class a prisoner belonged, it being a matter involving personal liberty.

Mr. Chandler, of Pennsylvania, said that the plan suggested by Count de Foresta was in most successful operation in Pennsylvania, and he believed that it might be made a success everywhere.

Dr. Mouat dissented from this view. He had been connected with prisons in India where such a system had been applied, and he believed it to be very corrupting.

Dr. Marquardsen said that the code adopted in Germany three years ago recognized the principle contended for by Count de Foresta. The distinction made there, however, was not between crime and crime, but between criminal and criminal, and it rested with the judge to decide whether the offender should be kept at hard labor or in *custodia honesta*. The latter class of criminals were imprisoned in a fortress. Speaking for himself personally, he believed that, in general, persons guilty of *minor* offenses should not be left without labor. He believed that the law of Germany embodied the true principle on this subject. Under its provisions, criminals were divided into hard-labor prisoners and such as were employed in the trades and professions to which they were accustomed.

§ 7. *Whether sentences for life are expedient.*—Baron von Holtzendorff, of Prussia, in opening the discussion on this question, called attention to the very decided difference in the view at present taken of the object to be attained by punishment and that which, as history discloses, was taken in the past. Salvation was now universally regarded as a primary end of correction, and this recognition of the principle that men ought to be reclaimed led to the agitation of the question under discussion. He did not, however, favor the abolition of life-sentences, if capital punishment were expunged from the penal code; and he believed that all who favored the abolition of the latter measure must agree with him. Imprisonment for life must remain the substitute for one or two centuries at least. But such a punishment should, like all other punishments, contain the elements of hope and fear: fear lest the term of imprisonment be actually for life, and hope of release after ten or twelve years on satisfactory proof of reformation.

Dr. Wines stated that, under the law of Missouri, a prisoner sentenced for life, who conducted himself with uniform propriety, became entitled to his liberty after fifteen years in the state-prison.

Dr. Mouat said that the same principle had been adopted in India.

Hon. D. Haines, of New Jersey, said that his objection to life-sentences lay in the fact that they left no hope in the convict's breast, without which there could be no reformation. Even if hope remained, it was too uncertain and remote to have much influence on the prisoner.

Mr. Stevens agreed with Baron von Holtzendorff, that life-long imprisonment was but the means to an end, and not an end in itself, but that it was demanded as a substitute in the event of capital punishment being abolished. Theoretically speaking, perpetual penalties should not exist.

Mr. Vaucher-Crémieux, of Switzerland, thought that the security of society forbade the liberation of an assassin or a man condemned to imprisonment for life. The possibility of a release would render society uneasy.

Mr. Hastings, of England, said that in that country there was practically no such thing as imprisonment for life. Though such sentences were passed, hope always remained, the prisoner being uniformly liber-

ated by the home secretary in the event of good conduct for a number of years.

§ 8. *Whether prisoners, on reconviction, should be subjected to a more severe disciplinary treatment.*—Mr. S. Petersen, of Bavaria, said that a recidivist apparently deserved severer treatment for the obstinacy of his criminal propensities. Yet in view of the fact that courts, in pronouncing sentence, always took into consideration the circumstance of a previous conviction, and, as a consequence, increased the length of the sentence, if the prison authorities also increased the severity of the punishment by a sterner disciplinary treatment, the prisoner was punished twice, which was manifestly unfair. The judge alone should award the increase of punishment.

Mr. Ploos van Amstel, of Holland, was of the same opinion.

Dr. Frey, of Austria, maintained that recidivists should be more severely treated. They felt this more sensibly than longer sentences. In the prison of Carlan, in Styria, where there were three stages of imprisonment, the first of which was exceedingly punitive, recidivists might be kept in the most severe stage for one-half their sentence, while those sentenced for a first offense were never kept in this stage for more than one-third of the time. The results of this system had been good.

Rev. Mr. Robin, of France, was convinced, by fifteen years' experience as prison chaplain, that the recidivist was never reformed by aggravated treatment. He gave an account of two men in a prison where he had been chaplain, on whom such treatment was tried. One died under it, and the other grew morose and stubborn; but when, at his request, the discipline was a little relaxed, the convict changed his course of conduct, and eventually, upon release, gave satisfactory evidence of reformation. Firmness should always be blended with kindness. To provide a discharged prisoner the means and opportunity of eating honest bread was a more effectual safeguard against relapses than a severity which was hostile to humanity and Christianity.

M. Stevens did not think that prison authorities should aggravate the punishment. The law should give longer sentences to recidivists, but all should receive the same treatment in prison; otherwise, there would be arbitrary differences, and the severity would go on increasing for the third and fourth offenses. It should be remembered that relapse was frequently caused by the prisoner finding every door closed against him on his discharge.

Count Sollohub, of Russia, thought that the proper punishment of recidivists was a question for the law, and not for the prison authorities. If the severity of the discipline were increased upon each conviction, a degree of severity would ultimately be reached, incompatible with reformatory influences. He agreed with Mr. Robin that prisoners' aid societies were the best means of preventing relapses and re-instating a prisoner in society.

Dr. Guillaume, of Switzerland, said that in that country recidivists were sentenced for a longer period than other criminals. In some cantons they were condemned to bread and water two or three days a week. This practice he did not favor, since it often left the prisoners in such a state of debility as to render a relapse easier. He deprecated recourse to a severity condemned by Christianity.

Count de Foresta thought, with Count Sollohub, that the law, and not the prison authorities, should prescribe the punishment of recidivists. He thought that any other plan would tend to cruelty. As Mr. Stevens had remarked, the fact that society was too often responsible for a prisoner's relapse should prevent excessive severity. He was fur-

ther opposed to the term *recidivist* being applied to a man, one of whose two offenses had been a crime of passion or excitement.

Rev. Dr. Bittinger, of Pennsylvania, advocated an increase of punishment for each new offense. In order to effect reformation, we must appeal to the criminal's sense of justice, but he would despise the justice which had the same punishment for the burglar, convicted of his fifteenth offense, as for the novice in crime.

Mrs. Julia Ward Howe, of Boston, thought that the criminal should be shown something better than his own savage standard of justice.

§ 9. *What ought to be the maximum of imprisonment, cellular or otherwise, for terms less than life?*—Dr. Marquardsen, of Bavaria, said this question was not so much one of principle as of adaptation to local circumstances. In general, however, he would say that the maximum ought to be fifteen years, with the possibility of reduction for good behavior. He believed, however, that the character of the punishment, as to mildness or severity, as well as its duration, should vary according to the heinousness or veniality of the offense; and in fixing the duration regard should be paid to the character of the punishment. In Germany, cellular imprisonment was generally limited to three years. He disapproved of the English system of sentences, under which there was no intermediate term between two years and five.

Dr. Frey stated that in Austria the term of isolated confinement did not exceed three years, while the longest term of imprisonment was twenty years.

Mr. Stevens stated that in Belgium the maximum of cellular confinement had been reduced from twenty years to ten, and then to nine and a half, when, if a man was found to be no better, he was placed in a congregate prison. It had not been found, however, that prisoners suffered more, either in mind or body, under the cellular than under the congregate system.

Mr. Moncure, of Scotland, said that in the prison at Perth it had been found that cellular confinement for more than three years produced insanity, notwithstanding that the prisoners had employment and communicated with chaplain, magistrates, and officers.

Baron Mackay said that in Holland the maximum of cellular confinement was, in 1851, fixed at six months, but had been increased, first to one year and then to two, and a further increase was favored. The term would probably be extended to three years as soon as the number of cells was sufficient.

Sir Walter Crofton referred to experiments carefully made at Pentonville, England, under the direction of Sir Joshua Jebb, formerly director of convict-prisons, the results of which showed that eighteen months was the longest possible period for which isolation could be safely maintained. During the time when transportation was employed as a means of punishment under the English law, the surgeons at the penal stations in the colonies reported that the condition of those men who had been kept in strict cellular confinement for a period of from two to two and a half years before being transported was particularly unsatisfactory. They were found to have suffered to some extent in their minds, and their wills were broken down. It was such reports as these that caused the reduction of the term of cellular confinement to nine months.

§ 10. *Whether or not imprisonment should be uniform in nature, and differ only in length.*—Count Sollohub, of Russia, in opening the discussion on this question, remarked that the object of a hospital was not to keep its patients, but to send them out cured. In like manner, the object of a prison should be to combat the moral malady, and return

patients to society cured. As hospitals, moreover, endeavor to guard against a relapse into physical disease, so the prison authorities should direct their efforts to prevent a relapse into the moral disease of crime. It should be considered in every case whether the offense was the result of perversity and a passion for crime, or of some sudden excitement or temptation. Different classes of criminals, like differently-affected patients, required various kinds of treatment, and every precaution should be taken against contagion, by which the disease might be aggravated and a cure rendered more difficult. Each kind of prison should have a special aim; a prison which attempted to effect two different objects would succeed in neither. There should be two classes of prisons: one for convicts whose characters evidenced moral perversity, the other for those whose offenses were the result of a sudden break-down of principle or of uncontrolled passion. This was the principle of division followed in Russia.

Dr. Mouat admitted that it was desirable to make punishment proportionate to guilt, but feared that there was no moral barometer by which guilt could be strictly measured.

Count de Foresta, of Italy, said there existed in that country and in France three classes of punishment: sentences to simple imprisonment, to reclusion, and to hard labor. The first class could not exceed five years, except in the case of recidivists, whose term might be doubled. The prisoner was employed in industrial labor. Reclusion had five years as a minimum and ten years as a maximum, and involved the loss of civil rights. Hard labor implied civic degradation and civil death, and persons sentenced to it for a term remained subject for their lives to police-supervision. Speaking for himself, he did not favor this system. He contended that there should be but one kind of sentence, the only difference being in length, and there should be different prisons with different disciplines for the various terms of imprisonment. Prisoners for three or four years should not be placed in the same buildings or treated in the same way as those sentenced for ten or fifteen years.

§ 11.—*Prison labor—penal and industrial.*—The question whether prison labor should be merely penal, or whether it should be industrial only, or whether there should be a mixture of both, was introduced by Mr. Frederic Hill, of England. Mr. Hill declared himself an earnest advocate of *industrial*, as opposed to purely *penal*, labor, such as the crank, tread-mill, shot-drill, &c. He recapitulated the main arguments for and against industrial labor in prisons. Its opponents, he said, based their hostility mainly on four grounds: 1, that it renders imprisonment less irksome, and consequently less deterrent, than it should be; 2, that it is difficult to procure for prisoners such kinds of work as will be really remunerative; 3, that, however suited to long imprisonments, industrial labor is not adapted to short sentences; and, 4, that its introduction into prisons subjects the honest, free laborers outside to unfair competition. In reply to the first objection, Mr. Hill urged that irksomeness is not the chief end of prison discipline. It neither prepares the prisoner for a life of honest industry himself nor eradicates motives to corrupt others, while it is highly improbable that its deterrent effect on others would be at all commensurate with the evils it engenders in those who are brought under such a system—the irritation, resentment, obstinacy, and hardness which it unquestionably produces; besides which, the confinement of a prison and the other privations attendant upon a convict's life are in themselves sufficiently irksome. The only true test whether a prison has become attractive, is

to open wide its doors to all comers, without demanding, as now, a qualification of crime. But although, during a considerable part of Mr. Hill's service as prison-inspector in Scotland, free entrance was really given, although no legal provision was made for the able-bodied poor, and although industrial labor was required of all, the proportion of paupers to compulsory prisoners was seldom more than one to fifty. To the second objection, Mr. Hill opposed his own experience as inspector in Scotland, where the main difficulties he encountered lay in the shortness of the sentences and the indisposition and incapacity of prison governors and their subordinates for this special duty. The third argument Mr. Hill met by showing, first, that, even in cases of short imprisonment, labor, productive in some degree at least, can always be provided; and, secondly, that when such punishments are but repetitions, often twenty or thirty times in succession, of the same penalty, the true remedy is not to render the system of discipline suitable to so absurd a practice, but, by a change in the law, to get rid of the practice itself.

In answer to the allegation of injustice done to honest mechanics by introducing trades into prisons, Mr. Hill pointed out that from the extremely small amount of manufacturing carried on at penal institutions the competition must necessarily be very small; and that from the care that a public department would be likely to take to avoid precipitancy in selling below the market-rates, the danger to ordinary trade from prison labor would probably be less than from the same amount of free labor. Moreover, cheapness in price is an advantage to the greater number, so that, even granting that prison manufactures did sensibly affect the permanent prices of articles, which he denied, such effect would be a good rather than an evil. And, as a last consideration, he urged that every shilling saved to the public by prison earnings is a shilling added to that fund from which wages must be paid.

Having thus noticed the arguments of the advocates of penal labor, Mr. Hill proceeded briefly to enumerate the grounds of his advocacy of the universal introduction of remunerative industrial labor into prisons. The following is a summary: 1. That to make labor useful and productive in prison, as well as out of prison, is in accordance with nature; that to strip it of these qualities is, if not absolutely unnatural, at least artificial; a course demanding justification and proof of its propriety—a proof not given. 2. That by means of useful and productive labor much of the cost to society of the apprehension, trial, and imprisonment of criminals may be repaid and something at least done toward indemnifying the persons wronged. 3. That such employment, being free from everything that is repulsive and degrading, becomes associated in the prisoner's mind with pleasurable thoughts, and tends to make him look upon work as deserving of respect. 4. That by this kind of work a prisoner, besides making the payments mentioned under the second head, may help to support his family and may provide a fund with which, at the end of his confinement, either to pay the cost of emigration or to have the means of making a fresh and honest start in his own country. 5. That prisoners who have been employed in useful and productive work are, at their liberation, much better armed against relapse into crime, as well as much better prepared to obtain an honest living, than those whose labor has been merely penal, and that, in fact, the proportion subsequently doing well is much larger.

Major Fulford, governor of Stafford jail, England, contended that prisons were not reformatories, but should be a terror to evil-doers. He considered that penal labor was necessary in the case of "repeaters,"

since the professional thief or drunkard was utterly insensible to high moral teaching. He thought, however, that such offenders should not be kept in a county jail, but sent to a convict establishment for a period long enough to eradicate his evil habits.

General Pilsbury, of Albany, thought penal labor destitute of any reformatory element. He had always found in American prisons that the most successful institutions, in a reformatory point of view, were those where industrial labor was so managed as to produce a substantial income.

Dr. Wines brought to the attention of the congress the large industrial prison of Count Sollohub, at Moscow, the reformatory results of whose discipline were remarkable, only nine prisoners having returned during six years out of 2,100 discharged. At this prison, each convict was permitted to choose the trade he would learn, and, on mastering it, was allowed two-thirds of his earnings. So great a stimulus was this to industry that a man often became a skilled workman in two months. To this system the distinguished count attributed the surprising reformatory results mentioned above.

Mr. Hibbert, M. P., of England, said that an act of Parliament of 1865 provided that the visiting magistrates might, under the sanction of the home secretary, substitute other forms of hard labor for the tread-mill, crank, and shot-drill. In Salford prison, penal labor was required of all prisoners during the first three months of their sentence, after which they might be employed in carpet-weaving, cocoa-mat making, &c. Nor was the penal labor wholly unproductive, since the tread-mill, besides pumping water for prison uses, supplied motive-power for the industrial labor. The prison earnings last year defrayed all expenses except the salaries of officers. The sentences were, as a rule, too short to allow of industrial labor being successfully carried on; out of 6,163 prisoners, 4,116 having been sent for terms less than a month, of whom 2,031 were sentenced for only seven days. Industrial labor being impossible under such sentences, he favored penal labor on the ground of its deterrent influence.

Sir John Bowring vehemently condemned the tread-mill, and rejoiced that continental languages had no word for it. It should be called a work-waster or wind-raiser. It hardened the old jail-bird, leading him to associate labor with non-productiveness, who well knew how to cast all the burden on the weaker or less experienced prisoners.

Mr. Ploos van Amstel, of Holland, said that remunerative industrial labor was adopted in the Dutch prisons, a portion of the prisoner's wages going to himself. He believed this system beneficial alike to the state and to the prisoner.

Colonel Colvill, governor of Coldbath Fields prison, London, said that he had the largest tread-mill in England in his prison, six hundred men being employed on it at one time. He never knew a man improved by it. On the other hand, accidents frequently occurred; many had their legs and arms broken; very recently a man undergoing a short sentence broke both his legs. It was, moreover, unfair, since the old hands could readily shift all the labor on their younger associates, who, especially if weak-chested, were sometimes injured for life.

Mr. Stevens, of Belgium, protested against all labor the tendency of which was to brutalize the prisoner. Penal labor was unknown on the continent.

Dr. Mouat said that during his experience in India he had found non-productive labor brutalizing. The tread-mill was tried at Calcutta, but caused many accidents and was abolished as cruel and unjust.

The anger and bitterness shown by prisoners on ascending or descending it had always made him feel that it was unchristian. To make prisoners miserable is not the true way to regenerate them. They must have an interest in their work, and be taught to apply it to useful purposes. The prisoners under his charge had, during the last five or six years of his administration, repaid by their labor 40 per cent. of the cost of their maintenance, thus relieving the tax-payers and preserving the convicts' self-respect.

Dr. Frey, of Austria, said that in the Austrian prisons industrial labor prevailed. This alone would call forth the full working powers of the prisoner.

CHAPTER XIX.

THE PRISONER AFTER HIS LIBERATION.

§ 1. *Best mode of aiding discharged prisoners.*—Mr. Murray Browne, secretary of the Metropolitan Discharged Prisoners' Relief Society of London, opened the discussion with a paper showing the operation of the English system of aiding liberated prisoners. The thirty-four societies established for this purpose are all voluntary associations of benevolent persons. The majority, however, possess a semi-official character, from the fact that the gratuities allowed by law to the prisoner on his discharge are, instead of being given to him directly, placed in the hands of a prisoners' aid society in trust, the society being required to account for each sum so received, which varies in amount from a few shillings to £3. The additional funds required by the societies for the prosecution of their work are raised by voluntary contribution.

These societies may be divided into two classes: those which assist men and those which assist women. Of the former, only two maintain homes or refuges. The most important of these is the Wakefield Industrial Home, where discharged prisoners are maintained as inmates, and kept at industrial work, often for a considerable time, until employment can be procured for them elsewhere.

This system has been tried in many other parts of England; but, although its success at Wakefield has been admirable, elsewhere it has failed, and a majority of the societies prefer another plan. They aim to find work for the prisoner as soon as possible, to provide him with pecuniary support while waiting, and to aid him morally, by advice and assistance, as far as may be in their power. The most difficult part of their task is the finding of employment. For this purpose a paid agent—usually an old police-officer—is employed, who is required to use great judgment and perseverance. It is found, in general, that the prisoner's best chance lies in a return to his own neighborhood, there to resume his former trade or occupation. Emigration is very seldom resorted to, chiefly on account of expense. Many lads are sent to sea in the merchant-service. As a rule, the difficulties in the way of obtaining situations for discharged male prisoners are not of such a nature that they cannot be overcome by tact and energy. There are, however, some persons fitted only for situations involving trust, such as clerks and others, for whom it is very hard to find employment. The society with which Mr. Browne is himself connected has, for the past eight years, aided five hundred liberated prisoners annually; and it has been the experience of that organization that it is never necessary to turn adrift a man able

and willing to work because no work could be found for him. This, Mr. Browne stated, was the general experience of prisoners' aid societies throughout England. And it further appears, from the records of his society and others, that not more than 5 per cent. of those who have been assisted in finding work have been recommitted.

The societies which aid discharged female prisoners have, in some respects, a more difficult task, since, with the exception of a certain number of first convictions, almost all convicted women in England are prostitutes as well as thieves, thus requiring a double treatment. Besides which, private families very naturally object to receiving women fresh from the prison walls, the genuineness of whose reformation has not been tested. Accordingly, all female prisoners' aid societies employ homes of some sort or other.

The refuges for *convict*-women (*i. e.*, women who have been sentenced to five years' penal servitude) are three in number, and possess a definite official character, somewhat resembling the intermediate prisons of the Crofton, or Irish, system. No prisoner is allowed to enter them until she has received a certain number of marks in prison and has served a fixed proportion of her sentence, when she receives a *ticket of leave* and, at her own request enters the home, from which she may be returned to the prison for misconduct. While she remains at the refuge, she is employed in industrial labor. When the sentences of the inmates expire, the managers find employment—usually at domestic service—for all those who require it. The results are of the most satisfactory description. These homes for *convict*-women, being, in one sense, a part of the prison system, are partially supported by the state, but in part also by voluntary contributions.

Other societies aiding discharged female prisoners exercise their own discretion as to the women they receive into their homes. They have no legal control over the inmates, nor do they receive any considerable assistance from state funds. They usually place their *protégés* at domestic service when they leave the homes.

Mr. Browne stated that the societies in general found themselves greatly hampered in their work by the want of funds, which, he remarked, was to be deplored on economic as well as reformatory grounds, since the pecuniary gain to the state-coffers from the reformation of even a few prisoners would pay the whole expense of a prisoners' aid society over and over again. He was of opinion, therefore, that liberal assistance should be granted from the public funds to these organizations.

Mr. Powell, of New York, believed it to be the duty of government to found asylums for discharged prisoners, which should not be called prisons or houses of refuge, but industrial institutions. These institutions he would have conducted in some measure on the co-operative plan, so that the laborer should share the advantages of his toil. In addition to these establishments there should be in every community voluntary societies for aiding discharged prisoners. Lastly, he believed that prisoners should be taught the lesson of abstinence from intoxicating liquors as a beverage.

M. d'Alinge, of Saxony, considered the question under discussion a most important one. There were in his country several societies for the aid of liberated prisoners, King John having founded the first forty years ago. Lately these societies had been extending help to the families of discharged prisoners also.

Mr. Rankin, of England, said that he was honorary secretary of a society which undertook the care of prisoners discharged from convict-prisons exclusively, while the other thirty-three societies took care of

those discharged from county prisons. The record of re-convictions from 1869 to 1871 showed that of those whom his society had aided less than 6 per cent. had relapsed into crime.

Baron Mackay, of Holland, stated that in the Netherlands a society for the aid of discharged prisoners had existed since 1823. Members of the society visit the prisons and distribute good books to the inmates. On a prisoner's discharge the society tries to find a situation for him, gives him clothing and tools, or, rather, pays for his emigration. Especially are juvenile offenders made the object of its care. The society formerly maintained, at the city of Leyden, a school for the training of this class of delinquents for the navy. Unfortunately, however, owing to the refusal of the government to receive the inmates as volunteers, this institution had to be abandoned. The society has many branches in different places in Holland, and in sundry towns it has ladies' committees to visit female prisoners and promote their getting situations after their discharge. Experience has shown how eminently fit ladies are for these duties.

Mrs. Meredith, of England, founder and manager of an establishment for the aid of discharged female prisoners, presented a paper in which the increased proportion, year by year, of recommitments of women was noticed, and the proposition that it was impossible to help this class of criminals efficiently without the aid of women was strenuously urged.

Rev. Mr. E. Robin, honorary secretary of the Paris Protestant Discharged Prisoners' Aid Society, said that in France the work of caring for discharged prisoners (called patronage) embraced industrial, moral, and religious instruction. Its aim was twofold, viz: First, to improve the prisoners' moral condition; and, secondly, to remove the distrust felt toward them, thus removing the two chief causes of their relapse into crime. The patronage extended by the Paris society commences by making a selection of the prisoners, through visiting them while in confinement, and by supplying them with religious books. On his discharge, the prisoner receives a card, and is thereby constituted a *protégé* of the society, who furnish him with food and clothing (no money is given) for a few days. When he obtains work, the society still watches over him, and he is required to report to them every change of residence, the society still lending him material aid and moral support until he has become completely rehabilitated. This system had proved very efficacious, not more than 5 per cent. of those so aided having relapsed into crime. Mr. Robin particularly urged the necessity of the aid societies having free access to the prisoners before their discharge.

Mr. Murray Browne agreed with Mr. Robin that patronage should begin in the prison, and observed that that was practically done in England, since the chaplain was invariably either a member or the secretary of a prisoners' aid society.

A member from France presented an account of the work of the patronage committee of Protestant ladies at Montpellier. This society maintains a home for discharged Protestant female prisoners, where religious instruction is given, and the managers of which endeavor to find situations for those inmates who give satisfactory evidence of reformation. The results were represented as most gratifying.

Dr. Guillaume, of Switzerland, thought that the assistance given to discharged prisoners should be both moral and industrial, and should be given both by the state and by voluntary societies. Nor should the importance of teaching prisoners a trade in prison be overlooked, since

this would be of material assistance to them on discharge. Employment, too, should be provided for them as soon as possible, lest the prisoner, while wandering about in search of work, should lose his desire for it and once more fall into evil ways. The prevalent opinion in Switzerland was that the Crofton system best attained these desired objects.

Mr. Bremner, of England, said that the experience of prisoners' aid societies in that country showed but little success in dealing with female criminals, which he attributed in great measure to the fact that female visitors and agents were not employed. The aid furnished to the societies by the state, too, was inadequate. So important did he consider the work of aiding discharged prisoners that he believed that some plan of moral and material assistance should be embodied in the criminal legislation of a country, to become as definite a part of the general system as are the trial and imprisonment of the offender.

§ 2. *Best means of securing the rehabilitation of prisoners.*—Mr. Stevens, of Belgium, said that the rehabilitation, to be complete, must be both moral and legal. The former was to be obtained by giving each prisoner instruction in the particular religion which he professed. The most perfect religious freedom is preserved in the Belgian prisons, and he earnestly contended for the same freedom in the prisons of all countries. The legal rehabilitation of the prisoner was to be effected, in his judgment, by freeing him from all restrictions, save those to which honest men are subjected. To make the forfeiture of political rights consequent upon imprisonment was to hang a weight around the prisoner who was striving to regain his position. A special patronage might be awarded to convicts whose conduct was good during imprisonment, which should be exercised over women by women and over men by men. He did not favor police supervision of criminals, as practised on the continent, although the friendly supervision contemplated by the Crofton system met with his approval.

Mr. Hastings, of England, said that by act of Parliament any bench of magistrates in charge of a jail might employ, in addition to the regular Protestant chaplain, a Roman Catholic chaplain, and pay his salary out of the funds at their disposal. There was then a bill before Parliament making the employment of such chaplains compulsory.

Sir Walter Crofton said that in all the Irish prisons there were employed, in addition to the chaplain belonging to the Church of England, Roman Catholic and Presbyterian chaplains.

Mrs. Julia Ward Howe, of Boston, thought that in dealing with this question it should be borne in mind that, as Mr. Emerson had said of the death of his child, "perhaps the world, and not the infant, failed." Too frequently the "failure" was rather on the part of society than of the prisoner.

Baron Mackay was not in favor of the rehabilitation of prisoners being effected by a judicial decree. The most perfect religious freedom prevailed in the prisons of Holland and Germany.

Mr. Baker, of England, said that the loss of character suffered by a prisoner in consequence of his incarceration was a wholesome and natural part of his punishment. He maintained that it should not be easy for a liberated convict to obtain attractive and remunerative situations; he ought to begin his new career with a lower kind of work, and rise to higher positions as he showed himself worthy. Supervision, as practised in England, was a powerful instrument in the rehabilitation of the prisoner; it was very rare to find a man under supervision out of work.

Dr. Wines enumerated the civil rights which, in most of the states of

the American Union, were forfeited by a conviction for felony, and explained the "commutation-laws" of his country, under which a convict may shorten his term by good conduct. In several of the states, he said, an irreproachable prison record wrought, of itself, a complete legal rehabilitation of the prisoner, restoring him at once to all his civil rights.

Hon. Mr. Chandler, of Pennsylvania, stated that a conviction for felony in that State did not work a forfeiture of any political rights.

Sir John Pakington, of England, deprecated what he had conceived to be an implication on the part of Mr. Stevens that Roman Catholics were not allowed religious freedom in English prisons. He claimed that the English people were universally opposed to the ignoring of denominational differences among prisoners, and stated that as a member of Parliament he had supported the bill mentioned by Mr. Hastings, requiring county jail authorities to employ Roman Catholic chaplains.*

§ 3. *Best mode of giving remission of sentences and regulating conditional discharges.*—Sir Walter Crofton said that remission of sentences and conditional liberation were now interwoven with the convict-system of the United Kingdom. The maximum remission to convicts sentenced to penal servitude was a fourth of their term, after deducting the nine months spent in solitary confinement. The title of a man to remission of sentence was determined by a system of marks, by which he advanced from class to class, until, according to his deserts as thus indicated, he obtained a partial or entire remission. This system, in effect, amounted to a partial substitution of labor-sentences for time-sentences. Sir Walter defended the system of public-works prisons at some length, saying that they were based on progressive classification, and pointing to the vindication of the Irish system by a recent parliamentary investigating committee, known as Lord Deven's commission. He regarded conditional liberation, combined with registration, as the only reliable mode of testing the value of prison training and of obtaining trustworthy criminal statistics, without which there can be little unity of action. He was of opinion that it was a great protection to society, since it surrounded the commission of crime with obstructions so formidable as to deter habitual offenders.

Mr. Tallack, of England, in reply to Sir Walter's defense of the public-works prisons, defended the cellular system, as approved by the congresses of Utrecht and Frankfort, preventing companionship with evil and allowing abundant communication with good. He called attention to the fact that a few months ago a convict at Spike Island had murdered a fellow-prisoner, and stated that there had been repeated murders at Portland, Chatham, and other public-works prisons.

Mr. Stevens stated that in Belgium conditional liberation was arrived at in another way from that employed in England. Reduction of time was allowed; but as separate detention without possibility of demoralization, and with intercourse with good counselors, was preferred to congregate labor, the reduction depended not so much on a prisoner's conduct as on his having undergone a period of separation proportionate to the sentence. There were certain privileges to be earned by good conduct, however, among which was liberation with curtailment or remission of police supervision. In cases of exemplary conduct and entire reform, the royal prerogative of pardon was exercised. Life-prisoners were kept in cellular confinement for ten years, when, if they were considered worthy of it, conditional liberation was granted them. If un-

* The bill alluded to was withdrawn before the close of the session, owing to a want of time in the House of Commons to discuss it.

worthy they were collected in a common prison, without hope of release. The result of this system was that the proportion of recidivists to those convicted of a first offense was but 4 or 5 per cent.; and the annual number of criminals had declined from 7,000, to 4,000, in spite of increasing population and wealth.

Hon. Joseph R. Chandler, of Pennsylvania, replying to Sir Walter Crofton's defense of the English system of granting "tickets of license," said that in the Eastern penitentiary of his State there were forty convicts who had received these licenses. He was no friend to a system which led men to pretend to be reformed, and declared his decided preference for the cellular over the Crofton system. He denied that that system was "solitary," and avowed that the only solitude it involved was a solitude as to demoralizing influences. Besides which it saved a man who was trying to lead a new life from being taunted by a former fellow-prisoner with being an *ex-convict*, thus often bringing upon him unmerited suspicion.

Mr. Frederic Hill regretted to hear of the invasion of Pennsylvania by ticket-of-leave men; but by way of explanation stated that the system, as formerly administered, did not, as now, make liberation depend upon good conduct; and he thought that the men mentioned by Mr. Chandler must have been liberated under the discarded system. As an inspector of prisons, he had at first favored the cellular system, but experience had weaned him from it. Mere isolation, while excellent as a part of a system, was not a system *per se*. Under the separate system, the absence of temptation rendered it difficult to test reformation.

Major Du Cane, chairman of the directors of English convict-prisons, said that in these institutions a prisoner was obliged to effect his discharge by his industry. The maximum remission of sentence was one-fourth of the time remaining after serving out his nine months of separate confinement. Great precautions were taken to insure the remission being justly awarded. When conditionally liberated, a prisoner was under the supervision of the police, to whom he was obliged to report himself. If he gave evidence of going astray, the police might take him before a magistrate, and on proof of his misconduct he was sent back to prison.

Mr. Nevin, one of the directors of the western penitentiary of Pennsylvania, gave an account of the change made in that prison from the cellular to the congregate system, which, he said, had been attended with great benefit.

Dr. Frey, of Austria, said that in that country cellular imprisonment was limited to three years; after that portion of his sentence had expired, a prisoner was placed under the congregate system. For himself, he favored such a combination of the two systems. A prisoner should mingle with his fellow-convicts, so as to become prepared for re-entering society, since, if kept entirely in solitary confinement, he would not be likely to withstand temptation on his release.

Mr. Hastings, of England, remarked that keeping a prisoner apart was like keeping the hand on a spring; the moment you lifted your hand, it flew up. When a man thus treated was discharged, the change was so great that he was almost certain to fall back into his original habits. He should be educated for liberation, after passing through the cellular stage, by associating with his fellow-criminals; and next by going to an intermediate prison, where he had much greater liberty, and where a further test was applied. If he still went on well, and gradually acquired habits of industry and fitness for liberty, he passed into the further stage of liberation under supervision.

§ 4. *Supervision of discharged convicts.*—Mr. Baker, of England, opened the discussion by explaining the law of England on this subject. Under that law, a person convicted a second time of felony may be condemned, in addition to imprisonment, to police supervision for a period not exceeding seven years. He must, at the end of each month, report himself and give an account of his conduct either to the police or some person authorized to receive his report. He must give notice of a change of residence to the police of the district which he leaves and of that to which he goes. The police, as long as he complies with the law, always prove his friends, assisting him in finding work and giving him, in case of need, money furnished by the prisoners' aid societies. This system, Mr. Baker contended, was kind to the supervised, offering him complete liberty as long as he conducted well, and exercising over him that friendly guardianship so useful to persons of infirm moral character. Moreover, it seemed to the public a protection of seven years instead of one, and allowed the term of imprisonment to be shortened by one-half, thus saving one-half the total cost of his expenses.

Mr. F. Hill remarked that Rev. Mr. Clay organized supervision in Lancashire years before Parliament adopted it. He found it caused a diminution of crime and was beneficial to the prisoners, the police helping them to obtain work.

Mr. Murray Browne said it was sometimes alleged that the police supervision would prevent prisoners getting work, but prisoners' aid societies knew that this was not the case. Last year, on the home secretary taking their opinion, thirteen societies out of sixteen were favorable to the system.

Mr. Stevens contended that, in countries where an organized police existed, discharged prisoners should be under no more supervision than other citizens. In Belgium a man might be sent by the police to a small place, not being permitted to go to large communities, but he might not find work there, and would be, in consequence, likely to relapse.

CHAPTER XX.

MISCELLANEOUS POINTS.

§ 1. *Whether prison officers need special training for their work.*—Dr. Guillaume, of Switzerland, opened the discussion, maintaining the affirmative of the question. He laid down the positions that it is for the interest of society that criminals should be reformed, and that they will become good only when unceasingly surrounded by good influences. From these premises he argued that the inferior as well as the higher officers of a prison should be acquainted with the moral and pedagogic means of penitentiary treatment, which acquaintance involved a recognition of the principle that a special education of prison officers is necessary and indispensable. It was for each country to determine whether it is desirable to establish normal schools for this purpose, or whether the employés should pass a preparatory training in a prison, or receive a course of periodical theoretic teaching. Speaking for himself, he wished the school for training prison officers to be in connection with a prison. Having selected men of ordinary intelligence, command of temper, &c., they should be put into the training prison to learn their work, after which they should be promoted according to merit, until,

possibly, they reached the top. These remarks did not apply to the governors or wardens of prisons, who should possess superior qualifications, and be endowed with a kind heart, sound judgment, general knowledge, and good temper. In conclusion, Dr. Guillaume said that he might summarize his views on this topic in the resolution adopted by the Prison Congress of Cincinnati in 1870, viz :

Special training, as well as high qualities of head and heart, is required to make a good prison or reformatory officer. The administration of public punishment will not become scientific, uniform, and successful until it is raised to the dignity of a profession, and men are specially trained for it as they are for other pursuits.

Major Du Cane, director of English convict-prisons, thought that prison officers, like physicians and soldiers, should learn their duty from actual experience. No preliminary instruction could be as valuable as seeing the supervision of skilled officials in actual practice. He believed that the tone of the English prison officials was all that it should be. A moderate amount of intelligence and education was required, and due care was taken to secure these qualifications, as well as firmness, honesty, and good temper. It was expected of them to convince the prisoners that society was not their enemy, but only wished to show them the way of well-doing. He believed that the prison officials in England did their duty efficiently, and that when recruits entered such a body they entered the best school in which to learn their duties.

Baron Mackay, of Holland, said that Dutch legislation discouraged technical education, believing that better material was found in a man with a general education than in one trained *ad hoc*. In the cellular prison at Amsterdam (the largest in Holland) it had not been found necessary to employ specially-trained officers. He agreed with Dr. Guillaume that training was desirable if it could be obtained within the prison-walls; but he objected to a normal school outside the prison for the inculcation of theories. He favored the promotion of subalterns, so trained, as vacancies occurred in the prison staff.

Sir Harry Verney, M. P., while not doubting that persons taken from the intelligent classes might make good prison officers, was, nevertheless, of the opinion that persons specially trained to the work would be more efficient. It had occurred to him, Why should not prison governors be selected from the subaltern officials? In England they were taken from the army and navy; but it might, perhaps, be better to advance prison officers. Many years ago, while visiting Dr. Wichern, at the Rauhe Haus, near Hamburg, he had seen there a number of young men being educated to take the place of officers in the prisons at Berlin. The idea struck him favorably at the time, and subsequent reflection had confirmed him in his opinion.

Mr. Rathbone, of England, pointed out an objection to the promotion of subalterns to the highest offices, viz, that the salaries now given did not attract men of education to these posts. A governor needed quick perception of character and great firmness—qualities, in his opinion, not specially cultivated by prison life.

Major Fulford, governor of Stafford jail, England, thought it would be absurd to have a normal school for subordinate officers. At his jail, such officers were always taken on probation, and, if found incompetent, were dismissed.

Dr. Mouat, of England, thought that, what the hospital and dissecting-room were to the surgeon, the prison was to officials. Intelligence and good moral character were indispensable, but it was in practical experience that they must learn their work. As to prison governors, he thought that, other things being equal, men should be selected who

were gentlemen and men of education in the broadest sense of the words. A prison was a moral hospital, which required a large amount of knowledge of mental phenomena, of religion, and education, and high aims in reclaiming the idle and vicious. Some special training was therefore advisable for both subordinate and superior officers.

Dr. Wines said that M. Demetz, the founder of the reformatory at Mettray, was so convinced of the necessity of a special training for those intrusted with the care of criminal men and boys that he had established a preparatory school, and spent an entire year with his colleagues in training twelve or fifteen young men as officers before he admitted a single inmate. The school had been kept up ever since, with twenty-five to thirty young men constantly in attendance, having a three years' course of training, and M. Demetz was strongly of opinion that Mettray would not have succeeded without it. The success of this reformatory probably surpassed that of any other institution in the world, scarcely 5 per cent. of those who left it ever returning to a career of crime.

§ 2. *Whether transportation is admissible and expedient in punishment of crime.*—Count de Foresta, of Italy, in opening the discussion, said that transportation, as carried on in France—transportation with compulsory labor in a colony—he approved of as the best punishment for great criminals, believing that it answered perfectly the double object of all punishment, viz, the protection of society within the limits of justice, and the reformation or amendment of the convict. It protects society by casting out from its bosom the most dangerous criminals, avoiding the grave inconveniences of relapses, and deterring would-be criminals by the prospect of banishment from their country and family. It encourages the convict by giving him a hope of becoming again useful to society and beginning a new life far from his old haunts, whither he may bring his family, or, if he have none, may found a new one. While thus approving of the main features of the French, as distinguished from the English, system of transportation, the count pointed out the defects of the latter and criticised them severely.

Mr. Pols, of Holland, thought that to send convicts to another country was unfair. If sent to a new colony, the natives were doomed to extermination. If the convicts were colonized, their descendants would, as in the English colonies, object to receive them, and the system would again have to be changed. Transportation for any length of time was impracticable.

Count Sollobub, of Russia, thought that transportation might be beneficial if a locality were selected which needed colonization and cultivation and external aid for the development of its resources.

Mr. Hastings, of England, remarked that to send convicts to an inhabited country was to wrong its citizens, who would, when they were able, resist it. To send them to an uninhabited country was merely to send them to a prison ten thousand or twelve thousand miles off, far removed from public supervision, a system always liable to great abuse. Moreover, the cost of the support of the convict was as great or greater as at home, and the expense of the voyage had to be incurred in addition.

Count de Foresta, in reply, said that he totally disapproved of transportation as formerly practised under the English law. He advocated sending convicts under life or fifteen or twenty year sentences to distant and, if possible, uninhabited regions, with separation at night and compulsory labor. When such colonies ultimately refused to receive convicts, (as the Australian colonies had,) it would be time enough to consider what should be done.

Baron von Holtzendorff thought that the experience of England was strongly against transportation, but that the question should be left open to the decision of countries that believed themselves to be placed under better conditions than England.

§ 3. *Whether short imprisonments and the non-payment of fines may be replaced by compulsory labor without privation of liberty.*—Count de Foresta, of Italy, explained to the congress a plan for effecting the end proposed in the title of the present section. He pointed out the evils attendant upon the imposing of sentences too short to admit of instruction or reformation, yet long enough to allow of the prisoner becoming morally corrupted. He believed that these evils might be diminished, if not entirely removed, by substituting for imprisonment obligatory labor during the day, leaving the condemned free to return to their families in the evening, like ordinary laborers. Again, as regards the payment of fines, since labor is the poor man's capital, the count urged that it would be more logical for society to re-imburse itself by means of his labor than to fling him into a cell, where he produced nothing. He admitted that this plan would prove difficult in execution, but denied that it was impracticable, and instanced many ways in which the condemned might be employed. He thought the system could be made applicable, especially in localities where there were large barren tracts to be reclaimed, or roads to be constructed.

Mr. Tallack, of England, remarked that the treatment of vagrants in that country was analogous to that proposed by Count de Foresta for petty offenders, which he approved, and would be glad to see adopted. It would prove beneficial to the offender himself in many instances, and the worst portion of the community would be deterred without breaking up homes and ruining families.

Rev. Mr. Collins, of England, favored the plan proposed by Count de Foresta. He had seen the agony caused in a respectable family by its principal member being committed to prison and branded as a jail-bird. Imprisonment should be made an object of dread, by surrounding it with disgrace and resorting to it as seldom as possible. He had long had misgivings, as a magistrate, whether he had not helped men to become criminals, rather than deterred them, by the imperative way in which the law required him to substitute short imprisonments for fines. By sending men to prison for a mere trivial offense, the feeling of shame was broken down, whereas self-respect should be maintained.

Mr. Stevens, of Belgium, thought that practically there would be found inconveniences in the system. Some prisoners were unaccustomed to manual labor. Again, how could employment be found for painters, musicians, &c.? Work in public would lack the penal element necessary in prison discipline, even for trifling offenses, and there would be some danger in collecting a dangerous class of men together, without the privation of liberty. He preferred to shut men up and subject them to moral influence.

Sir John Bowring considered the plan entirely feasible, if the condition of individual offenders and the circumstances of the locality were taken into account. In an agricultural district the men might be employed in agriculture, while in town they would be accustomed to various trades, which might be carried on by them. He once found a locksmith in a solitary cell earning seven shillings a day.

Baron Mackay, of Holland, regarded the proposal as chimerical. If the condemned received less than his wonted compensation, the punishment fell more heavily on his family than on himself. If, on the other hand, he received full pay, the only change in his mode of life being

working in one place instead of another, where would be the punishment? It would be a punishment only for those unaccustomed to manual labor, to whom it would be an aggravation rather than an alleviation, while, in such cases, mere intellectual work, if allowed, would be too slight a punishment.

Mr. Bremner, an English magistrate, thought the imposition of fines a very unequal punishment, and believed that, in case of inability to pay a fine, justice demanded some other alternative than imprisonment.

Baron von Holtzendorff would point to Prussia as a proof of the feasibility of the scheme. For twenty years there had existed a law providing labor as a substitute for a fine in the case of offenses against the forest-laws and wood-stealing.

§ 4. *The proper limits of the power of boards of prison managers as regards the administration of prisons.*—M. Loyson, of France, said that, in his country, there were regularly-appointed commissioners of supervision, whose functions were carefully defined. Their special mission consisted in promoting the moral and religious reformation of the convicts. The commissioners and the prison governors were entirely independent of each other. If the former perceived anything requiring correction, they notified the director, and, in case he refused to interfere, they might appeal to the prefect of the department or to the minister of the interior. Their services were entirely gratuitous, and they were generally chosen from the leading inhabitants of the district. He believed that this system, as a whole, offered advantages which no other could, since the daily visits of local commissioners were better than the occasional visits of inspectors.

M. Vaucher-Crémieux, of Switzerland, said that in that country the grand council of the canton appointed a commission, which was unconnected with the prison authorities and which might visit the prison at their discretion. They could point out defects and suggest remedies, but had no executive power.

Colonel Ratcliff, of England, said that the visiting justices in each county saw that the law was properly administered, while the government sent down an inspector yearly to examine all the details of administration.

§ 5. *Whether the government of prisons should be placed in the hands of one supreme central authority.*—Mr. Hastings, of England, thought that the plan adopted in that country, of having the county jails entirely distinct from the higher grade of prisons—the former being under the control of the local authorities, the latter under that of the general government—was preferable to a uniform system, under which all penal institutions should be subject to one central authority. Such a system, while it would undoubtedly have its advantages, would be apt to become stereotyped. He doubted whether it could be authoritatively declared that any one system was so far superior to all others that it ought to be enforced everywhere. A variety of details and an interchange of opinions and experiences would probably pave the way for a better system than any which could be theoretically devised.

Mr. Ploos van Amstel said that in Holland the minister of justice was chief administrator of prisons. A change of ministry, which was not infrequent, always involved the possibility of changes in prison management. To secure permanence, he thought that a council of three or four members should act with the minister. Local boards, nominated by the government, were charged with the interior administration or supervision of the prisons in every locality.

Mr. Stevens, of Belgium, admitted that political decentralization had

its advantages, but questioned whether this was the case with administrative decentralization. In Belgium, all prisons were under a uniform system. If a local commission suggested an improvement, it was considered by the central authority, and, if approved, was introduced in all prisons. Punishment as well as law surely ought to be uniform.

Dr. Guillaume, of Switzerland, said that each of the twenty-five Swiss cantons had its own legislature and administration, thus preventing any uniformity. He believed, however, that a central authority (he would say the minister of the interior) should have the direction of prisons, refuges, and similar institutions having a preventive or other effect on crime.

Messrs. Carter and Baker, of England, warmly defended the English system of local management for local prisons. County magistrates, in their opinion, were better acquainted with the feelings of the people, and could therefore manage the jails better than a central authority.

§ 6. *International prison statistics.*—Mr. Beltrani-Scalia, of Italy, said that it was needless to show the utility of penitentiary statistics, which alone could furnish legislators with the elements necessary for a reform of the penal system, and which, moreover, would furnish judges with valuable hints in the application of punishment. He deplored the want of success which had attended the recommendations and efforts put forth in this direction by the prison congresses of 1858 and 1863, and by the statistical congresses of 1857, 1860, and 1870. He thought that an international commission ought to be appointed, comprising representatives of the different countries, which would lay down the basis of international prison statistics, leaving each government free to determine the form and time of the official publications it considered useful. The statistical congress at the Hague, in 1870, had expressed a wish that the tables be prepared, not only in the language of the country, but also in French. He regarded the suggestion as a good one.

Count Sollohub, of Russia, considered the suggestion of Mr. Beltrani-Scalia with regard to an international commission not only wise, but feasible. He felt sure no country would refuse to co-operate.

Dr. Frey, of Austria, thought that a comparison between different countries would be attended with some difficulty, though he hoped not insuperable. A different percentage, under different systems might be due to nationality, not to system. Thus, if the question arose how many persons suffered from lunacy under isolated and how many under congregate imprisonment, the percentage of lunacy in the country should be considered. So with regard to the rate of mortality in prisons.

Dr. Guillaume, of Switzerland, urged the importance of criminal statistics as a guide to prison-reformers. Minute information should be obtained of the criminal, so that the springs of crime might be ascertained and dried up.

Professor Leone Levi, of England, proposed that an international commission be appointed by this congress to lay down the principles of a yearly statistical report on crime and prison discipline. Uniformity of nomenclature of crime was indispensable in order to ascertain its increase or decrease. What was murder in one country was not murder in another. A system should be devised that would guard against ambiguity in this regard.

§ 7. *The best means of repressing criminal capitalists.*—Mr. Edwin Hill, of England, began the discussion by reading a paper on this subject. He thought that the public mind was at fault in not having, as yet, grasped the important truth that crime on a large scale is a craft, so far organized as to require the co-operation of labor and capital for

its successful operation. These "criminal capitalists" he divided into four classes, viz: 1, the providers of homes for the predatory classes—*i. e.*, owners of real property occupied by thieves; 2, keepers of "flash-houses," or establishments wherein thieves meet for purposes of carousal and to plot the crimes they intend to perpetrate; 3, booty-mongers, or receivers of stolen property, called, in thieves' slang, "fences;" and, 4, the inventors and manufacturers of burglarious implements. He believed and knew that so dependent were thieves upon these four classes of capitalists, if the supporting capital were withdrawn, thieving, as a vocation, must cease. He instanced two distressing evils which, in such case, could not fail to be suppressed, viz, first, the birth and nurture of children so environed by criminality as to have, practically, no means of escape; and, secondly, the street-corruption of honest men's children by evil associations and the enticement to pilfer now offered by the purchasers of petty pilferings. He admitted that organized criminality would cease as entirely, could the mere operative thieves all be driven from the field, but urged that the want of success that has so far attended the vast efforts put forth and the enormous expense incurred by society in seeking to effect this was an argument to try the plan that he had suggested, which he considered much more certain, far less expensive, and equally effectual. He pointed out what he considered to be numerous defects in the existing English law on this subject, and suggested changes for the purpose of, first, effectually deterring the owners of real property from suffering it to become a refuge for criminals; and, secondly, to render the conviction of receivers of stolen property more easy than it now is. He also urged the justice of heavily mulcting all capital found aiding the operations of criminals to defray the enormous expense of police, prisons, &c.

Mr. Serjeant Cox, of England, said that in that country a law had been recently passed increasing the minimum quantity which a marine-store keeper or junk-dealer was allowed to purchase, this class of dealers being usually encouragers of petty pilfering by purchasing the stolen bits of iron, old rope, and other articles purloined by children. The effect of this law had been to materially reduce the number of such crimes, and he believed if its principle were extended to other articles, and shop-keepers were prohibited purchasing from children under a certain age any commodities which they were not likely to have acquired rightfully, and restrictions were placed upon the hours during which marine-store dealers might be dealt with, very much good would probably ensue. In the court over which he presided he had made it a principle always to give the receiver double the punishment inflicted on the thief. If this rule were universally carried out, receiving would be regarded as a much more dangerous employment, and the limitation of the number would increase the check we could keep on those that remained.

Hon. J. R. Chandler, of Pennsylvania, stated the law in America on this subject to be that the owner of stolen property could always compel the party in whose possession it was found to account for the manner in which it came into his possession, and that a house wherein trade in stolen goods was carried on could be dealt with as a "disorderly house." As to that class of capitalists who amassed wealth out of the ruin of one sex, he considered hanging their merited punishment.

Colonel Ratcliff, of England, thought it impracticable to require the inspectors of houses to close those buildings wherein known thieves lived. He said that it was often an advantage to the police to know

the houses in which thieves congregated, since it enabled them more readily to find men of whom they were in search.

Mr. Aspinall, of England, thought that an incorrect impression might be derived from Mr. Hill's statement as to the difficulty of convicting receivers under the English law, which was very much the same as Mr. Chandler had stated to be the law of his country. It would be an encroachment on the liberty of the subject to allow private houses to be searched without special warrant, but all public houses were open to police visitation at any moment. All junk-dealers were required to take out a license, and to enter in a book, subject to police inspection, every transaction in metals and that sort of property which children were tempted to steal, from the facility with which it could be turned into money. Besides which, it was not uncommon in his own city (Liverpool) for the magistrates to punish the receiver seven times as much as the thief. He made these statements, fearing that strangers might receive an exaggerated idea of the defects of the English law in this particular from Mr. Edwin Hill's paper.

§ 8. *Whether whipping is expedient as a punishment for crime.*—Mr. Pols, of Holland, said that, not out of sympathy with ruffians, but with honest people, he urged the abolition of bodily inflictions in punishment of crime, which he considered wholly inefficient as a means of social defense, engendering cruelty, and being far more injurious to society, which imposed it, than to the criminal, who suffered it. In inflicting punishment regard should always be had to its probable reformatory results. The criminal's moral and religious feelings should be respected and fostered, a love of order and of labor implanted, his sense of responsibility and his power of self-restraint increased. To effect this, we must reach the understanding, the way to which was not through the lash. He did not believe that there were any criminals so hardened that this faculty could not be reached through moral suasion; while violence bred violence, harshness engendered hatred, hardness excited to revolt. In Holland, flogging had been prohibited in the school and the prison, and expunged from the penal code. In each instance, its abolition had resulted in a diminution of the offenses for which, previously, it had been inflicted. In the army, although not formally abolished, it had been practically discontinued for forty years, during which time insubordination had steadily decreased. He had no hesitation in attributing to the abolition of corporal punishment no small share of the happiness of Holland, and what was true of Holland he believed to be true of other continental states.

Mr. Aspinall, of England, observed that apparent was not always real philanthropy, and that, while regarding the reformatory element of punishment, that which was deterrent should not be overlooked. He was for resorting to corporal punishment where every other agency failed. Wife and women beaters deserved the lash, and in the majority of cases no other punishment had any effect. Could any one see the blackened eyes, discolored flesh, and crippled forms of wretched women and children, he would say that the monsters who produced these deserved corporal punishment.

Colonel Ratcliff, of England, thought that there was a certain class of men who were susceptible to no other influence. That it was efficacious he maintained was proved by the fact that, immediately after the passage of the act visiting garroters with corporal punishment, robberies with violence were no more heard of.

Dr. Marquardsen, of Bavaria, remarked that public opinion in Eng-

land had been unduly influenced by the garroting panic, but for which it would have kept pace with that of the continent on this question.

§ 9. *Extradition treaties.*—Dr. Frey, of Austria, introduced this question, maintaining that the negotiation of treaties between civilized states for the extradition of criminals ought not to be influenced by political considerations. There could be no doubt, he said, that the absence of such treaties constituted a temptation to criminals, who knew that they could commit a crime, and afterward enjoy immunity from arrest in a neighboring state. Such treaties were, therefore, of vital importance.

No discussion followed Dr. Frey's remarks.

§ 10. *Woman's work in prisons.*—Mrs. Chase, of Rhode Island, opened the discussion on this question by alluding to the efforts that have recently been made in several of the States in her country to secure the appointment of women on the boards of state-prison inspectors. She said that those who urged this measure based their claim primarily on the ground that it is the *duty* of women to share with men in the care, instruction, and reformation of criminals, and that they can best do so if empowered with the same authority. Criminal women especially need the sympathy and society of their own sex; and the women who are usually employed in the capacity of prison matrons are not, she thought, generally capable of comprehending the peculiar condition of these unfortunates, which, on several accounts, is more deplorable than that of criminal men. Nor, in her opinion, was the evil remedied by volunteer visitation of prisons by women. While much may be accomplished through this means, still a woman who feels that she is so employed by permission only cannot fail to be greatly embarrassed; and, if she call attention to any abuse, her criticism is regarded as unwarrantable interference, and often leads to her exclusion. She also called attention to the softening influence that good women might reasonably be expected to exert over male criminals separated, in many cases, from their families and removed from all home associations. Again, the counsels of women in the board of inspectors would be valuable in all matters pertaining to the domestic economy of prison. As a member of the legally-constituted board of female visitors of the Rhode Island state-prison, she knew that the attention of the inspectors was mainly given to the men. As the chairman of the board of inspectors had said to her, "We cannot go into the women's hospital, and we know nothing about it." This inattention, which she believed to be general throughout the country, she attributed to three causes: first, the comparatively small number of women in prison made it seem less important that they should be looked after; secondly, good men regard a fallen woman as so much worse than a fallen man that they involuntarily shrink from association with her; and, thirdly, the public sentiment that regards fallen women as hopelessly lost follows them within the prison-walls, and the inspectors feel that they cannot hold out to them the same hopes as to men. An inspector had once said to her, "We don't know what to say to them." She believed that if there was anything to say to them, if in any way the path to a life of virtue could be opened to them, if the stone which an unjust public sentiment had laid over the grave of their respectability *could* be rolled away, it must be done by women, and from her own experience she knew that, to do this thoroughly and well, women must share with men the responsibility and authority which guide and control these institutions.

Miss Mary Carpenter, of England, was not one of those who desired that woman should take the place of man or do man's work, but she wished to define what, in her judgment, was the special work of women

in connection with prisons. She believed that everything which concerned the reformation of female convicts should be solely, and the reformation of children partly, under the care of women. Children requiring reformation should be placed in homes, not in prisons; and there can be no true home without a mother, or a sister, or some woman to control it. Ladies ought to conduct and manage reformatory schools for girls. She admitted that a majority of women were incapable of managing business arrangements in a board, but thought that they might be trained to it. It was also very important that the higher influence of educated women, when combined with an earnest, philanthropic, and religious spirit, should be brought to bear upon female convicts. She was aware of the great difficulties attending the visitation of prisons by women, but they had been triumphantly surmounted in the convict-prisons of Ireland, where ladies of approved position and character were permitted to visit the inmates, each lady confining herself exclusively to the denomination of female convicts to which she belonged. This system had worked admirably. She agreed with Mrs. Chase that lady visitors ought to have an official position. It was, however, when a woman had left prison that the good offices of her own sex were especially required. She would give to ladies such a part in the reformation of convicts out of prison as was done at Golden Bridge, in Ireland, in the institution which Sir Walter Crofton established. In that country, where the majority were Roman Catholics, the gentleman named had requested the nuns of the Golden Bridge Convent to take charge of female prisoners before their terms of sentence had expired, the institution receiving an allowance for their maintenance from the prison authorities. If their conduct while there is bad, they are remitted to prison; if good, families were found in abundance willing to take them into their homes. So successful had this system proved, that out of the thousands of cases that had passed through it, there had been very few relapses. Sir Walter Crofton had, after great effort, obtained permission of the government to try it in England. This he had done on a small scale, and with like success. The institution had been entirely under the control and management of women, though of course there had been, behind their authority, legal power to direct.

Miss Emily Faithful, of England, desired to bear her testimony to the great value of the institution to which Miss Carpenter had referred as having been founded by Sir Walter Crofton in England, and thought it very desirable that such establishments should exist in every part of the country, since it was of vital importance to a discharged female prisoner that an opportunity of leading a better life should be afforded her. But for families to receive these women promiscuously into their homes, immediately upon their release, would be productive of more harm than good. She deeply felt the necessity for the appointment of lady-visitors, but thought that women should be specially trained for this work.

Mrs. Julia Ward Howe, of America, thought that, if it were well to have female physicians in certain cases of bodily disease, it was equally important that some of the doctors of crime should be women. She believed that women themselves and society at large were both at fault in this matter.

Mrs. Lewis, of England, spoke of her first visit to the large female prison at Fulham. A lady-visitor had not been seen for months, and the cheering influence produced by her visit, alike upon officials and inmates, was plainly perceptible. The inference that she drew was that lady-visitors could not be too often admitted to these establishments.

Mr. Bremner, of England, said that only women could approach the better feelings of fallen women, and he thought that the non-recognition of this principle by prison managers was a grave mistake. He believed that lady-visitors should have an official position in female prisons, which would free them from the charge of meddlesome interference. As a proof of the inability of men to supply the place of women in this work, he remarked that the Prisoners' Aid Society of Manchester had failed so entirely in its work among liberated female convicts that it had abandoned it altogether.

Rev. Mr. Crombleholme, of England, had, as a manager of an industrial school for boys, felt the necessity of having a good woman to deal with them. A large proportion of children born in prisons and work-houses, or sent to work-houses, died before reaching the age of seven years, for want of a woman's motherly care. He believed, moreover, that it was impossible to reform women except through female agency. He believed that an official board of lady-visitors should be attached to every prison.

Lady Bowring spoke of the peculiar difficulties that beset fallen women on attempting to reform their lives, and urged the appointment of an official board of ladies in connection with each female prison, who might awaken a desire in their breasts to lead a better life, and might render such an end more easily accomplished.

CHAPTER XXI.

PREVENTIVE AND REFORMATORY WORK.

Rev. Charles L. Brace, secretary of the New York Children's Aid Society, introduced the discussion of this topic in a long, able, and interesting paper on the prevention of juvenile crime in large cities. He believed that the greatest danger to both property and life in large cities was from the class of ignorant, neglected, and outcast youth, the fearful increase of whose criminal precocity could be checked only by organization and combination. The task, even under the most favorable conditions, is one requiring great skill, judgment, and perseverance. The first influence needed is sympathy. The great majority of these outcasts cannot believe that any one cares for them. This solitude is what especially drives a girl to despair and ruin. When these children begin to learn that those more fortunate in life have a sincere sympathy for them, half the danger has passed away; they become susceptible to reforming influences and are less exposed to temptations to vice and crime. The second influence indispensable to the successful prosecution of this work is education, or school-training, which inculcates habits of steady labor, punctuality, and exactness, and a taste for knowledge, besides enabling the youth to earn his bread. To make education, however, universal, it should be gratuitous and compulsory. Together with school-training naturally comes discipline, invaluable to these street-wanderers, unaccustomed as they are to self-control and submission to law. But, in teaching them discipline, their independence and self-help, so far from being checked, should be encouraged. Industrial training, also, should be imparted to these children. It is not desirable, however, to attempt self-supporting industrial movements among them, but rather to fit them for any occupation by teaching habits of industry. Religion is an indispensable element in any combination of influences designed

to effect a saving work among these juvenile vagrants. Nothing else can strengthen them against the tide of evil influences in which they are placed. Mr. Brace further mentioned, as the final and best practical agency in efforts in large towns for this class, the plan of "placing out," or emigration to country districts. This breaks up all the worst associations about these unfortunate youths, takes them from their companions and haunts of vice, puts them where others will respect them if they respect themselves, gives them the best of all labors for "minds diseased"—labor on the soil—opens to them a chance of success and competency, and places them in the most useful class in every country, the tillers of the ground. Besides the advantages here indicated, this plan commends itself on the score of economy, the expense of "placing out" being a bagatelle compared to that of a public institution, such as an alms-house, asylum, or reformatory for an equal number. It relieves the community of paupers and future criminals, and destroys hereditary pauperism. Mr. Brace then gave an extended account of the formation and work of the New York Children's Aid Society, whose chief agency he stated to be "placing out" these children in country homes in the Western States, which has been, in his opinion, an unmingled blessing, and the most economical charity ever devised. The number of children thus sent West since the formation of the society has been 22,000, of whom comparatively few drift back to the city.

Miss Mary Carpenter, the manager and founder of the Red Lodge Reformatory for Girls, Bristol, England, continued the discussion by the reading of a most valuable paper on "The Principles and Results of the English Reformatory and Certified Industrial Schools." The system on which these schools are conducted has been already so fully explained in Part First of this report, that but a brief *résumé* of the main points in the very interesting paper by Miss Carpenter will be attempted here. The difference between the two classes of institutions mentioned in the title of the paper lies in the fact that to the former may be committed for a certain number of years children guilty of any act punishable with not less than fourteen days' previous imprisonment, while the latter are intended for young persons in a state of *proclivity* to crime. Both classes of schools must be established by private benevolence, but must be inspected by some one appointed by the secretary of state, and if he *certify* them as fit and proper for the purpose, the state grants a fixed sum per capita for each child sentenced to the school as long as he remains an inmate. This allowance is smaller in the case of industrial schools. A number of small institutions have been found better than a few large central ones. In order that a home feeling may be inspired, each school should be adapted to receive only fifty or sixty inmates; if any institutions contain a larger number, they are divided into several schools, each of which occupies a separate house. In the general training, industrial, and if possible, out-door employment occupies a prominent part, the girls being taught such occupations as will prepare them for domestic life. At least three hours daily are devoted to religious instruction and the ordinary branches of education. Sufficient time is allowed for recreation and occasional innocent gratification. The food, clothing, and surroundings in reformatories are such as are adapted to working boys and girls, and conduce to their health and civilization, without giving them undue indulgence. The results of this system Miss Carpenter described as most encouraging. As an illustration, she mentioned that, of seventy girls discharged from her own reformatory during four years, only one was reconvicted during that period, nine others were doubtful or unknown, and sixty were maintaining themselves re-

spectably, six of them having been well married. But independent of any isolated facts or any statistics, Miss Carpenter stated that juvenile crime, as it existed twenty years ago, has been *absolutely annihilated*. At the outset of this reformatory work, young persons were frequently committed who had been in prison six or eight times; at present, cases of even a second conviction are uncommon. So satisfactory have been its results, that children who have passed through a reformatory are sought for, even in preference to others, as being better prepared for work than ordinary children. And as a final result of the reformatory work thus described, Miss Carpenter stated that the public interest had been awakened in these outcast children, and that it is now well understood that, in this matter at least, sound political economy and true Christianity are not really at variance, and the heart and conscience of the nation have been opened to bestow money and effort, as well as love and sympathy, to save these young ones.

Mr. J. A. Foote, of Ohio, briefly noticed the success that had attended the work of the Ohio Reform School, and said that reformatory work was the romance of doing good.

Mr. Vaucher-Crémieux, of Switzerland, thought that in the reformation of juvenile offenders the germ of crime was destroyed. He particularly favored agricultural colonies like Mettray, where, out of four thousand inmates, it was believed that there were scarcely a score who had not been completely regenerated.

Mr. Hendrickson, of Wisconsin, described the school of which he is the superintendent, which is conducted on what is known as the family plan, and which had been remarkably successful.

Mr. Howe, superintendent of the Ohio Reform Farm School, gave an interesting sketch of the organization, growth, and complete success of that institution.

Mr. Bournat, of France, said that in that country there were two classes of reformatories, called, respectively, penitentiary and correctional colonies. To the former were sent young offenders sentenced to less than two years' imprisonment, as well as orphans under sixteen who were judged not to have erred knowingly; to the latter were sent those sentenced for more than two years and those guilty of insubordination in the penitentiary colonies. The cellular prison of La Petite Roquette, Paris, received minors under sixteen. If their conduct in the penitentiary was good, they were surrendered to the patronage society for liberated juveniles of the Seine, which apprenticed them to a trade. If their conduct gave satisfaction to their masters, they were not interfered with; if otherwise, they were sent back to the penitentiary.

Mr. Marshall, of England, described the boys' reformatory at Feltham and that for girls at Hampstead. In the former, boys were instructed in practical seamanship, and were often well received by captains when applying for positions on ship-board on discharge. At the latter, the inmates were trained for domestic service, and situations were readily obtained for them on liberation. At both, scholastic and religious educations were imparted with assiduity and success.

Sir T. Fowell Buxton, of England, said that in that country it was seldom possible to reduce the average retention of juvenile delinquents to less than twelve or eighteen months. The facilities for "placing out" children, as described by Mr. Brace, were not so good in England as in America, owing to the greater density of the population.

Mr. Baker, of England, as one of the pioneer founders of reformatory schools, recounted the difficulties that had attended their formation. In 1856 Parliament passed laws enabling reformatories to spring up all

over the country, the result being that in four years the number of commitments of juveniles had been reduced from 14,000 to 8,000.

Baron von Holtzendorff, of Prussia, said that compulsory education was one of the preventive measures adopted in Germany, and that, owing to this, such spectacles as met the eye in London were never seen in Berlin. Children under twelve were not brought before a magistrate, but punished by the school-master. Between the ages of twelve and eighteen, they might be sent to reformatories, which were generally under the management of private persons, and where they might be detained until they reached the age of twenty. He was of opinion that the progressive treatment might be applied to juvenile delinquents. The prevailing opinion in Germany was that it was not sufficient merely to detain a child to the age of thirteen or fourteen at a public school, but that there should be a complementary course to the age of eighteen, and that boys and girls who had left school ought to be obliged to attend evening lectures twice a week. This was thought desirable because the period he had mentioned was a very dangerous one. Such a complementary course was believed to be of much importance, and some such provision had been already made in Saxony. The subject was now occupying the attention of the Prussian government.

Dr. Guillaume, of Switzerland, thought education in infancy was the best preventive of crime, a predisposition to which he believed was sometimes hereditary. Neglected children were not responsible for their moral infirmities. To place such children in charitable, Christian homes he considered better than sending them to reformatories. Since in Switzerland a sufficient number of such families could not be found, institutions to the number of seventy or eighty had been established to care for these children. They were so organized as to resemble a family as much as possible. Not more than 10 or 15 per cent. of the inmates turned out badly. The rest became good citizens in after-life, marrying and themselves founding new homes.

Mr. Wills, of England, had once seen gardens allotted to fifty of the best boys in a reformatory having two hundred inmates. The influence of this step had been very good.

Rev. Mr. Crombleholme, of England, thought that the German practice of having the school-master, rather than the magistrate, manage children under twelve, as described by Baron von Holtzendorff, was an excellent one. He also favored the complementary training mentioned, and thought that it was a short-sighted economy to allow considerations of expense to influence public action in this connection.

Mr. Aspinall, of England, while estimating at its full value the good effected through the agency of reformatory, industrial, and public schools, and giving to the system of compulsory education its just due, still thought that all these measures should be supplemented by efforts to improve the homes from which the children came, and to elevate their parents. Here, he considered, was a broad field for Christian philanthropy.

Sir Walter Crofton thought the general feeling of the meeting, as his own conviction certainly, was in favor of the family system.

Dr. Marquardsen, of Bavaria, Dr. Guillaume, of Switzerland, and Rev. Mr. Coit, of Massachusetts, in reply to questions of Mrs. Meredith, stated the practice in their several countries in regard to the illegitimate children of female prisoners. In Bavaria and Massachusetts they become wards of the state, and in Switzerland were taken care of by the local authorities.

Mr. Ford, of England, remarked that it was a singular fact that in

England the more criminal institutions—the reformatories—had remained stationary ten years; and these were now only sixty-four or sixty-five. But the least criminal class of institutions—the industrial schools—had more than doubled in number during the same period. In 1861 there were forty-one, and fifty had been established since. Thus it appeared that the latter were doing away with the necessity for the former.

CHAPTER XXII.

PENITENTIARY SYSTEMS.

§ 1. *The Irish convict system, as explained by Sir Walter Crofton.*—This system first endeavors to make the criminal feel that his punishment is not simply afflictive, but also reformatory. To stimulate him in his reformation the element of hope is combined with the punitive element, and the system of classification shows him that his fate is in his own hands. This classification is the result of a system of marks awarded for intelligence, work, and zeal. They are not given as a reward for mere intelligence, for the most criminal are often intellectually brightest, and would thus be most rewarded. The first thing aimed at is to give the criminal a liking for work, for generally idleness led him to crime. But work will give him no pleasure unless he is remunerated for it. After a certain time passed in a cell, when strengthened and comforted by the visits of the minister, he will live in common with other prisoners. During his treatment on the collective system, the change effected in his character can be appreciated, and he is rewarded by the distribution of marks. He is now arbiter of his own lot, and can only get into a higher class by diligence and zeal. Lastly, when he has given sufficient guarantees of good conduct, he passes into an intermediate prison, which is designed to test the work previously done, as the crucible tests gold. These intermediate prisons, in which the prisoners enjoy a semi-liberty, have produced excellent results. Those living in them conduct themselves as free workmen. Penal labor in all the Irish convict-prisons is prohibited. This system has been proved a triumphant success. Its reformatory results are most encouraging, a consideration more than counter-balancing, even pecuniarily, the slightly increased expense which it may involve. Time, however, is required for its reforming influences to operate; hence the minimum sentence has been fixed at five years. Prisoners who gain a remission of imprisonment receive a “ticket of license,” liberating them conditionally. Escapes among prisoners so liberated are very rare, particularly since the institution of police supervision, under which system each holder of a “ticket of license” is required to report his residence and occupation to the police each month. If such a prisoner is again apprehended before the time for which he was sentenced has expired, he is sent back to the prison from which he was liberated. In reply to a question, Sir Walter stated that prisoners, on arriving at the intermediate prison, were treated with respect and confidence, and that their conduct elsewhere justified this treatment. As an illustration of this proposition, he said that in a certain prison some one of the prisoners was intrusted each week with the execution of errands outside the prison; in seven years only one had returned intoxicated. A prisoner who has relapsed after passing through the intermediate prison is not allowed to return there again. Life-sentenced men, after ten years’ cellular imprisonment with hard labor, are impris-

oned commonly in a special prison, and after twenty years their fate is determined by the government.

§ 2. *The Irish borough and county prisons, as explained by Hon. C. F. Bourke and others.*—The management of these prisons is confined to boards of superintendence, composed each of twelve gentlemen of social position and influence in their respective counties, chosen by the grand juries of the counties. At present there is little uniformity in the discipline of these prisons, but at the last session of Parliament a bill was passed giving to the executive the power to make uniform rules and by-laws for their management. All prisoners, juvenile and adult, male and female, attend the prison schools daily, many of those advanced in life learning both to read and write during their imprisonment. A medical officer is connected with each jail, who is required to visit each prisoner twice a week at least, and oftener if necessary, and who has the right to alter the diet or labor of any prisoner according to his judgment. Each board of superintendence is empowered to appoint, and usually did appoint, three chaplains—one Episcopalian, one Roman Catholic, and one Presbyterian. The great difficulty with which the prison managers have to contend is the number of short sentences, (very many being for only twenty-four hours,) which rather promote crime than check it. A majority of these sentences are inflicted on drunkards, who are wholly undeterred thereby. It amounts practically merely to giving the prisoner a good bed for the night gratuitously, often an unwonted luxury, which is, in many cases, enjoyed by the same prisoner at intervals of a week for more than one hundred times. Mr. Bourke thought that committing magistrates should be empowered to pass cumulative sentences on such prisoners, and that more stringent enactments with reference to the sale of ardent spirits should be incorporated in the law.

§ 3. *The English convict system, as explained by Major C. F. Du Cane.*—[The greater part of Major Du Cane's explanation, having been embodied in his answers to the interrogatories mentioned in Part First of this report, has been epitomized there, and need not be repeated.]

Major Du Cane defended the ticket-of-license system as practised in England. In reply to questions propounded by members of the congress, he stated that life-sentenced prisoners were usually conditionally liberated by the secretary of state after twenty years' cellular imprisonment. He did not consider the number of recidivists any evidence of the value of a prison system. In 1870 more than 25 per cent. of those discharged from the English prisons had relapsed into crime, which was an increase of a little more than 2 per cent. over the preceding year. He said that his ideal would be to see 100 per cent. of recidivists, since this would show that it is always the same men who commit crime, and that the social pest was really limited and localized. Great attention is paid to the industrial training of the convicts in the English prisons, 1,600 out of 2,200 apprenticed to some mechanical trade having learned it completely. A portion of the prisoner's earnings—not exceeding £3—was allowed to him, the sum awarded varying according to his industry. The convict, however, was not allowed to send any portion of this money to his family; but on his discharge it was given to a prisoners' aid society, if he requested their assistance and protection; otherwise, the police were requested to give it to him in small sums. Marks are given the prisoners as a reward for industry, and if the number earned is sufficient, they are promoted from class to class. If any convict feels dissatisfied, he may appeal to the governor, and from him to the director, from whose decision an appeal lies to the secretary of state. Appeals to the director are frequent;

but if the prisoner's statement of facts is false, he is liable to a disciplinary punishment.

§ 4. *The English borough and county prisons, as explained by Captain Armytage, Dr. Mouat, and others.*—Captain Armytage, of England, gave a detailed account of the Wakefield prison, of which he is the governor. The majority of the inmates were sentenced to from three to seven days' imprisonment, many of whom, discharged on Saturday, returned to the prison on the following Monday. The longest term of imprisonment in a county jail is two years for one offense. A majority of the prisoners were misdemeanants who owed their incarceration to intemperance. Penal labor was employed, but seldom except as a punishment for breaches of discipline. Connected with this prison is the industrial home for discharged male prisoners, of which Mr. Browne had made mention. The cost per head in this establishment was 7s. 2d. per week. Some of the inmates' earnings amounted to £1 per week, their employment being mat-making, and light work of that sort. There is also a female home, in which the women are employed principally in washing, and are trained for domestic service, and there is a constant demand for them as servants. A well-assorted library is connected with the prison, to which the inmates have access. Perfect religious equality prevails, both Roman Catholic and Protestant chaplains being employed.

Archbishop Manning addressed the congress at length on the subject of religious freedom in prisons, pleading that the conscience of Roman Catholic prisoners should be protected equally with that of Protestants. He earnestly hoped for the passage by Parliament of an act then before the body making the employment of Roman Catholic chaplains compulsory in every county jail. He stated that no salary would be asked for if objection were made on the ground of expense. The employment of chaplains of his faith was now simply permitted in the county jails, and there were one hundred and nine jails where none were employed. He wished to see it made everywhere obligatory in this class of prisons as it now is in the convict or government prisons.

The remarks of the archbishop elicited general approval from the English members, Dr. Mouat observing that, if there was but one Roman Catholic prisoner in the prison, his receiving religious instruction according to his faith ought to be a matter of right, and not of permission.

§ 5. *The Scotch prison system, as explained by Mr. J. Monclure.*—There is but one general prison in Scotland. No male prisoners are sent here for terms longer than three years, those whose sentence exceeds this being transferred, after a probationary term of nine months, to public-works prisons in England. The system of discipline in the latter prisons is identical with that pursued at Perth. The county jails receive prisoners sentenced for from twenty-four hours to nine months, although, owing to the limited accommodation at Perth, it is sometimes found necessary to retain in the county and borough jails prisoners sentenced for a longer term, in which case their board is paid by the government. Civil and criminal debtors are confined in these jails as well, and are allowed greater privileges. The diet varies according to their sentence, depending upon its duration, and whether with or without hard labor. Corporal punishment is not allowed, except in the case of boys sentenced for petty offenses, and is even then very seldom used. Penal labor is employed, which in most cases is made productive. Nowhere in Scotland do the earnings of prisoners pay for half their maintenance. Gratuities are given to well-conducted and industrious prisoners on their discharge. Convicts discharged from the prison at Perth all receive a

gratuity varying from 5s. to £4, according to their conduct and industry. To receive the latter sum, a prisoner must have had no demerit marks whatever. A portion of the money is given him when he leaves the prison. The remainder is paid in fortnightly installments, on his forwarding a certificate, signed by the police, that he is obtaining an honest livelihood. This police supervision works admirably, protecting those inclined to do well, and acting as a salutary check on those who are disposed to return to vicious courses. The superintendence of all the prisons of Scotland is confined to a central board at Edinburgh, under the direction of the home secretary. They superintend the collection of judicial and penitentiary statistics. One of their number visits the prison at Perth twice a month, sees each prisoner, hears complaints, and inspects the buildings, stores, &c.

§ 6. *The Belgian prison system, as explained by Mr. Stevens.*—The cellular system is strictly enforced in nearly all the Belgian prisons. Mr. Stevens claimed that it possesses two classes of advantages, positive and negative. Among the former he enumerated, with other benefits, the opportunity it affords for the separate study and treatment of each prisoner, and adapting the discipline to the situation and needs of all the prisoners, thus securing the efficacy of the punishment. He considered a variation in the treatment of moral disease as necessary as in that of physical disease. The cellular system also enables the prisoner to preserve the feeling of his dignity as a man and of his personal responsibility. The prevention of moral contagion, the subduing and calming influence of solitude, and the opportunity offered for reflection and repentance were all, in Mr. Stevens's opinion, found in the cellular system. In a word, he considered that no system attained more directly or perfectly the various objects of punishment—repression, expiation, prevention, and reformation. As the prisoner's reform progresses, cellular confinement becomes less and less irksome to him, until at last he would regard removal to a congregate prison as an intolerable punishment. In consequence of its repressive and reformatory efficacy, this system, Mr. Stevens claimed, allowed a diminution of the duration of imprisonment, thus greatly lessening expense. A want of sufficient cellular accommodation alone has prevented the introduction of this system into all the Belgian prisons, and this obstacle is being removed as rapidly as possible. Its results in that country have abundantly justified its adoption. The official returns prove that the average number of recidivists is 4.46 per cent. of those leaving cellular prisons, while it is 68.80 per cent. of those liberated from congregate prisons. Lastly, Mr. Stevens stated the remarkable fact that in Belgium the number of prisoners has decreased during the last six years from 7,000 to 4,000, a result which he attributed in part to the introduction of the cellular system.

§ 7. *The Russian prison system, projected but not yet reduced to practice, as described by Count Sollohub.*—Count Sollohub explained a complete system of penitentiary treatment, full of novel views and original ideas. Want of time prevented him from finishing his explanation, but he submitted a pamphlet on the subject, which was distributed to the members of the congress. This has been translated and printed, as the reader will have observed, in Chapter XIV, Part First, of this report.

§ 8. *The French prison system, as explained by Mr. Béranger.*—Great interest is taken at present in France in the subject of prison reform, and the National Assembly has appointed a commission to inquire into the condition of French prisons and suggest improvements. This commission deputized Mr. Béranger to attend the congress. He said that

the system now followed presented three prominent characteristics: first, young criminals are imprisoned in reformatories; secondly, help is given to the man who commits a first crime; and, thirdly, an attempt is made to get rid of recidivists. It is in effecting the object last named that the greatest difficulty is apprehended.

Being interrogated as to the state of public opinion in France as regards the cellular system, Mr. Béranger said he believed it was not unpopular. He avowed himself an advocate of that system.

§ 9. *The Swiss prison system, as explained by Dr. Guillaume.*—After various experiments, public opinion in Switzerland has become definitively settled in favor of the Crofton system. The details of its application are contained in Part First, and will be further illustrated in Part Fourth.

§ 10. *The Italian prison system, as explained by Count de Foresta.*—There is at present no well-defined and uniform prison system in Italy. A commission, however, has been appointed by the King to prepare a code that shall attain this end. Of this commission both the Count de Foresta and Mr. Beltrani-Scalia were members. The preference of both these gentlemen was for the Crofton, or Irish, system; but this sentiment was not unanimous among the commission, which has not as yet come to any resolution. The count felt quite certain, however, that the cellular system would not be adopted, since it was believed to be ill-adapted to Italian character. At present prisoners were generally imprisoned collectively in galleys, (*bagnes*;) they are chained; but those who distinguish themselves by good conduct are placed in agricultural colonies on the islands.

§ 11. *The German prison system as explained by Herr Ekert and Dr. Varrentrapp.*—Herr Ekert, director of the cellular prison of Bruchsal, in Baden, summarized the provisions of the German penal code. Corporal punishment is abolished, cellular imprisonment and conditional liberation established, and police surveillance humanely conducted but firmly maintained. Separate imprisonment in Germany, when applied to women as well as to men, produced excellent results. Formerly in Baden the maximum duration of cellular imprisonment was ten years; the new German penal code has fixed it at only three years. Herr Ekert avowed himself an earnest supporter of the cellular system and concurred in all the conclusions of Mr. Stevens. In his own prison he has seen convicts live thirteen years in separate confinement without any inconvenience. He alleged that recidivists were very rare among those who had undergone this punishment for many years, and furnished results tending to show that its influence on the moral and physical health of the prisoners was very beneficial. In reply to interrogatories Mr. Ekert said that there were no criminal statistics in Germany. He added that all prisoners except 1 per cent. could endure cellular confinement for life without inconvenience.

Baron von Holtzendorff congratulated Herr Ekert on the results obtained at Bruchsal, but added immediately that, notwithstanding these results, he himself did not approve of that system; that the public opinion of Germany was opposed to it, and that an executive committee sitting at Berlin, under one of the city magistrates as president, had unanimously decided to apply the cellular treatment in cases of short imprisonment, and the progressive system of Sir Walter Crofton when longer sentences had to be undergone.

Dr. Varrentrapp, of Frankfort, vigorously contested the statement that public opinion in Germany had pronounced against the cellular system. In the Grand Duchy of Baden, at Frankfort, in Würtemberg, Hanover, the Grand Duchy of Hesse, and Bavaria, it had been adopted,

and it was only on financial grounds that it was not more completely applied. Bavaria had, however, already built a magnificent cellular prison, which had produced excellent results. Dr. Varrentrapp considered that the new German penal code prefers and adopts the cellular system. His own preference therefor was, he said, supported by the experience and study of forty years; and he combated the attacks made against this system, which appeared to him to have a most rational basis.

§ 12. *The Netherland's prison system, as explained by Mr. Ploos van Amstel.*—In Holland the Belgian, or cellular, system is to a very considerable extent in operation, the maximum of separate confinement being two years. The prisoners are employed in a variety of industries, and gratuities are allowed for diligence. As a magistrate and inspector, he had, for many years, visited the prisoners in the cellular prison of Amsterdam, and always found their health excellent, better even than he found it in collective prisons. He never observed bad results, either as respects their moral or physical condition. For this reason he supported the opinions of M. Stevens.

§ 13. *The Swedish prison system, as explained by M. Almquist.*—M. Almquist said that in Sweden serious attention was given to penitentiary reform. Sweden in this respect had still much to accomplish and much to learn from other countries. The cellular system is there in operation, and has not been followed by the evil results attributed to it by its adversaries. The prisoners enjoy better health in the cellular than in the collective prisons, while the cases of insanity are also fewer in the former prisons.

§ 14. *The Austrian prison system, as explained by Dr. Frey.*—Dr. Frey stated that up to the present time in Austria the collective system, pure and simple, had been practised, without classification or separation of any kind. At first they had thought of introducing the cellular system as practised in Belgium, but, fearing it would interfere with the health of the prisoners, preference had been given to the progressive system. A maximum duration of three years' cellular imprisonment is followed by life in common and by classes more or less privileged. Conditional liberation has not yet been introduced.

§ 15. *Prison system of India, as explained by Dr. Mouat and others.*—A synopsis of the paper read by Dr. Mouat on the Indian prison system has been already given in Part First, Chapter XVI. Mr. Thornton and Dr. Grey, of India, supplemented the account furnished by Dr. Mouat by giving some interesting statistical details relative to the prisons of the Punjaub. In other respects, however, their statements shed no new light upon the internal operation of the system, beyond the lucid description of Dr. Mouat.

§ 16. *The prison system of the United States, as explained by Hon. Joseph R. Chandler, General Pilsbury, and others.*—The representatives from New York, Pennsylvania, Indiana, and Maine present in the congress described each the prisons of his own State. It was remarked that, owing to the independence of the several States of the Union of each other, a uniform system throughout the country was impossible. The eastern penitentiary of Pennsylvania is the only prison in the United States conducted on the cellular plan. Its managers are abundantly satisfied of the superiority of this system over that of congregate labor. General Pilsbury and Dr. Wines deplored the influence of party politics upon the state-prisons of New York, and expressed a belief that a radical change in the fundamental law of the State would soon render a recurrence of the present evils impossible. A brief outline was also given of the plan upon which it is proposed to construct and manage a new State adult

reformatory at Elmira. To this prison are to be sent young men between the ages of sixteen and twenty-five. There would be, so to speak, three prisons under one roof, and the prisoners would have to begin at one and would be advanced to the others, as they earned such promotion by good conduct. The system would be that of Sir Walter Crofton, slightly modified.

The county jails throughout the country were represented, with few exceptions, as inadequate, in every way, for the work required of them. This fact was freely admitted by a majority of the American delegates, many of whom, however, expressed a hope soon to see radical reforms instituted in their own States.

CHAPTER XXIII.

CONCLUDING SESSION OF THE CONGRESS.

§ 1. *Presentation of the works of Edward Livingston on criminal jurisprudence.*—Dr. Wines offered to the acceptance of the congress a set of the complete works of Edward Livingston, in two volumes, published in America fifty years ago. He also presented, at the same time, for M. Vergé, a member of the Institute of France, an edition of the same work in French, recently published under the auspices of the Institute. He stated that, through funds generously proffered for the purpose, the National Prison Association of the United States had then in press, and would shortly issue, a new American edition of Livingston. It was, he said, a remarkable as well as pleasing circumstance that there should meet on that floor, and be presented to the congress, French and American editions of a work which, though written and published a full half century ago, had anticipated most of the great reforms in prison discipline which the world is now slowly and laboriously engaged in working out. M. Vergé had been called to Paris that morning by duties which could not be postponed, but had handed to him, together with the book, a letter addressed to the president of the congress, which would be read in French, and afterward translated into English by Musurus Bey, a delegate to the congress commissioned by the Sublime Porte. The letter was then read as follows:

LONDON, July 12, 1872.

MR. PRESIDENT: I have the honor to ask you to offer to the International Congress on Prison Reform a copy of the French edition of the great work of Livingston, one of the most eminent men of the United States of America, and among the most zealous pioneers in the reform of the penal and penitentiary system. This edition is preceded by a biographical sketch of Mr. Livingston by M. Mignet, and a critical essay by M. Charles Lucas, a member of the Institute of France, the friend and successor of Livingston in his labors in behalf of penitentiary reform, undertaken half a century ago. Livingston was a member of the Institute of France, (Academy of Moral and Political Sciences.) He has found in the Old World as well as the New admirers and followers. Receive, Mr. President, the assurance of my most distinguished sentiments.

CHARLES VERGÉ.

Member of the Institute.

Archbishop Manning, who had intended to offer some remarks on the work thus presented to the congress, but forbore to do so lest he should occupy time that might be needed for other purposes, subsequently addressed the following letter to Dr. Wines:

8 YORK PLACE, July 21, 1872.

MY DEAR SIR: Our thanks are due to you in chief for the International Prison Congress, which has resulted not only in much valuable information, but in the estab-

lishment of a permanent union of correspondence in respect to the statistics and discipline of prisons. But for the initiative taken by you and by the Government of the United States, I do not think this would have been attained. We have also to thank you for Mr. Livingston's valuable work on reform and prison discipline. I am sorry that it did not arrive earlier in our proceedings. Mr. Livingston was before his time. He has anticipated the substance of our late discussions on the separate system in his words, "Imprisonment with seclusion and labor will diminish offenses; imprisonment without seclusion will increase them." I was not aware that this had been tried and proved so long ago as 1791 in the United States. His book is worthy of his high name as a just and good man. I am sorry that I had not the opportunity of expressing what I think is due to Mr. Livingston as a forerunner in the recent amelioration of our prison-discipline, which is, day by day, becoming vital to the welfare and even to the safety of the civil society of the world.

Believe me, my dear sir, yours, very faithfully,

† HENRY E.,
Archbishop of Westminster.

The Rev. Dr. WINES.

§ 2. *Presentation to the congress of M. Charles Lucas's observations on the Penitentiary Congress of London.*—In making this presentation to the congress, Dr. Wines said that, as the observations of M. Lucas were addressed to the French Academy of Moral and Political Sciences, and would not therefore be embodied in the proceedings of the congress, and as they lacked nothing of the value that would naturally attach to them from the long study, large experience, and eminent ability of the writer, he would ask the indulgence of that body in offering a brief *résumé* of the important paper submitted by him. He said:

M. Lucas remarks that such reunions as the congress of London are a necessary consequence of the two laws of the sociability and perfectibility of man, which, in an advanced civilization, require the international exchange of ideas for the moral progress of humanity just as they do that of material commodities for the increase of national wealth. International congresses show the respective conditions of nations as regards their intellectual and moral development in the same manner as international industrial exhibitions do the comparative results of their economic development. Heretofore there have been congresses of governments and congresses of peoples, but the Congress of London is original and unique in that it combines both these elements. After a rapid glance at the work of organizing the congress, M. Lucas proceeds to offer some general considerations in relation to the subject. He says that Beccaria and Howard were, and ought to have been, philanthropists, for that character was demanded of them by the cruelties of both the criminal law and the criminal administration of their age. But the times have happily changed since then, and with them ideas and usages as well. Man, in the state of penal servitude, is no longer a thing, but a moral being, whose liberty human justice has not the right to confiscate absolutely and irrevocably, but only within the limits required by the protection and security of social order. The logical sequence of this view is that it is the duty of society to reform the criminal during his temporary privation of liberty, since in this way only can the peril of his relapse be successfully combated, and the public safety effectually maintained. The reformation of imprisoned criminals is not, therefore, in our day, a work of philanthropy, but an obligation of the state.

M. Lucas claims that the discipline of the Catholic Church furnished the model for both the cellular and associated systems of imprisonment, since known as those of Pennsylvania and Auburn, save that the Auburn system added corporal chastisements to the discipline of silence, and the Pennsylvania system subtracted worship in common, to the detriment of religion, and associated exercise at the expense of humanity. M. Lucas recalls to the memory of the academy the discussion of the 10th, 17th, and 24th of February, 1844, in which, single-handed, he contended against the three ablest supporters of the Pennsylvania system in France—Messrs. Béranger, de Tocqueville, and de Beaumont. It was not that he was absolutely opposed to isolation by day and night, since in his "Theory of Imprisonment," published in 1836, he was the first to propose the application of the cellular system to prisoners awaiting trial; and, in the sphere of imprisonment after sentence, he would not wholly exclude the use of the system, but would restrict its duration to one year. It was at the point of departure from this limit that the controversy began between M. Lucas and his distinguished associates, they contending for an unlimited and he for a restricted application of the cellular system. The inadmissibility of isolation in long imprisonments he grounds on the following considerations: Man is born sociable and perfectible, and it is by the action of his sociability that his perfection is secured. Isolation is, therefore, a de-

nial of the necessary process for his perfection; it is a violence done to his nature which cannot be safely prolonged for any great length of time. Experience must infallibly confirm this philosophical demonstration, since the education of any being whatsoever is but the development of his nature. Penitentiary education must act with the certainty of enlightening and invigorating the intelligence of the convict, and not by exposing him to the peril of weakening and even of destroying that essential instrument of his regeneration. Cellular isolation, in effect, does not permit either the initiative, the effort, or the probation, without which there can be neither morality nor moral reformation, (*ni moralité ni moralisation.*)

M. Lucas discusses in his pamphlet the proper number of prisoners to be admitted into any one penitentiary establishment, and arrives at the conclusion that four hundred is the maximum that can be treated effectively for their reformation. He grounds this belief on the consideration that only a moderate number of prisoners will permit that serious personal influence which, in order to their reformation, must be exercised upon them by the director and his co-laborers. He adds that, during his long administrative career as inspector of French prisons, he never ceased, but always in vain, to cry out against the agglomeration in the central prisons as creating an impossibility of penitentiary reform, and asks whether any one can suppose that, in those immense barracks of ten, twelve, fifteen hundred prisoners, the director can know them otherwise than by their numbers? Where is the use, he says, of talking of penitentiary reform when it is rendered impossible by such numbers of prisoners congregated in the same prison? In short, M. Lucas finds the following to be the essential conditions of a reformatory prison discipline, namely: isolation at night, the rule of silence during the day, a maximum of four hundred prisoners in any one establishment, and progressive classification.

§ 3. *Propositions submitted to the congress by the American delegation.*—This series of propositions was offered some days previous to the final session, but is introduced at this point because it formed the basis, as will be seen under the next section, of the declaration of principles embodied in the final report of the executive committee and approved by unanimous vote of the congress. The propositions are as follows:

1. The treatment of criminals by society is for the protection of society. But, since such treatment is directed rather to the criminal than to the crime, its great object should be his moral regeneration. Hence it should be made a primary aim of prison discipline to reform the criminal, and not simply to inflict upon him a certain amount of vindictive suffering. The best guarantee of the public security against a repetition of his crime is the re-establishment of moral harmony in the soul of the criminal himself—his new birth to a respect for the laws.

2. In the moral regeneration of the criminal, hope is a more powerful agent than fear; it should therefore be made an ever-present force in the minds of prisoners by a well-devised and skillfully-applied system of rewards for good conduct, industry, and attention to learning. Such rewards may be a diminution of sentence, a participation in earnings, a gradual withdrawal of restraint, and a constant enlargement of privilege, as these shall be severally earned by meritorious conduct. Rewards more than punishments are essential to every good penitentiary system.

3. The progressive classification of prisoners based on merit, and not on any mere arbitrary principle—as crime, age, &c.—should be established in all prisons designed for the treatment of convicted criminals. In this way the prisoner's destiny during his incarceration should be placed, measurably, in his own hands; he must be put into circumstances where he will be able, through his own exertions, to continually better his condition. A regulated self-interest must be brought into play. In the prison, as in free society, there must be the stimulus of some personal advantage accruing from the prisoner's efforts. Giving prisoners an interest in their industry and good conduct tends to give them beneficial thoughts and habits, and what no severity of punishment will enforce a moderate personal interest will readily obtain.

4. In criminal treatment moral forces should be relied on with as little admixture of physical force as may be; organized persuasion, to the utmost extent possible, should be made to take the place of coercive restraint, the object being to make upright and industrious *freemen*, rather than orderly and obedient *prisoners*. Brute force may make good prisoners; moral training alone will make good citizens. To the latter of these ends the living soul must be won; to the former only the inert and obedient body. To compass the reformation of criminals, the military type in prison management must be abandoned, and a discipline by moral forces substituted in its place. The objects of military discipline and prison discipline, being directly opposed to each other, cannot be pursued by the same road. The one is meant to train men to act together, the other to prepare them to act separately. The one relies upon force, which never yet created virtue; the other on motives, which are the sole agency for attaining moral ends. The special object of the one is to suppress individual charac-

ter and reduce all to component parts of a compact machine; that of the other is to develop and strengthen individual character, and by instilling right principles to encourage and enable it to act on these independently.

5. Nevertheless, unsuitable indulgence is as pernicious as unsuitable severity, the true principle being to place the prisoner in a position of stern adversity, from which he must work his way out by his own exertions—that is, by diligent labor and a constant course of voluntary self-command and self-denial. As a rule, reformation can be attained only through a stern and severe training. It is in a benevolent adversity, whether in the freedom of ordinary life or the servitude of the prison, that all the manly virtues are born and nurtured. It is easy enough for a bad man to put up with a little more degradation, a little more contumely, a few more blows or harsh restrictions; but to set his shoulder to the wheel, to command his temper, his appetites, his self-indulgent propensities, to struggle steadily out of his position—and all voluntarily, all from an inward impulse, stimulated by a moral necessity—this is a harder task, a far heavier imposition. Yet it is just this training that a right prison discipline must exact, and only through such training that it can succeed.

6. It is essential to a reformatory prison treatment that the self-respect of the prisoner should be cultivated to the utmost, and that every effort be made to give back to him his manhood. Hence, all disciplinary punishments that inflict unnecessary pain or humiliation should be abolished as of evil influence; and, instead, the penalty of prison offenses should be the forfeiture of some privilege, or of a part of the progress already made toward liberation, with or without diminished food, or a period of stricter confinement. There is no greater mistake in the whole compass of penal discipline than its studied imposition of degradation as a part of punishment. Such imposition destroys every better impulse and aspiration. It crushes the weak, irritates the strong, and indisposes all to submission and reform. It is trampling where we ought to raise, and is, therefore, as unchristian in principle as it is unwise in policy. On the other hand, no imposition would be so improving, none so favorable to the cultivation of the prisoner's self-respect, self-command, and recovery of manhood, as the making of every deviation from the line of right bear on present privilege or ultimate release. Such punishments would be as the drop of water, that wears away the granite rock, and would, without needless pain or wanton cruelty, and especially without further injury to their manhood, subdue at length even the most refractory.

7. A system of prison discipline, to be truly reformatory, must gain the will of the convict. He is to be amended, but this is impossible with his mind in a state of hostility. No system can hope to succeed which does not secure this harmony of wills, so that the prisoner shall choose for himself what his officer chooses for him. But to this end the officer must really choose the good of the prisoner, and the prisoner must remain in his choice long enough for virtue to become a habit. This consent of wills is an essential condition of reformation, for a bad man can never be made good against his consent. Nowhere can reformation become the rule instead of the exception, where this choice of the same things by prison keepers and prison inmates has not been attained.

8. No prison can become a school of reform till there is, on the part of the officers, a hearty desire and intention to accomplish this object. Where there is no prevalent aim to this effect, there can be no general results in this direction. Such a purpose, however, universally entertained by prison officers, would revolutionize prison discipline by changing its whole spirit; and fit reformatory processes would follow such change as naturally as the harvest follows the sowing. It is not so much any specific apparatus that is needed, as it is the introduction of a really benevolent spirit into our prison management. Once let it become the heartfelt desire and purpose of prison-officers to reform the criminals under their care, and they will speedily become inventive of the methods adapted to the work.

9. In order to the reformation of imprisoned criminals, there must also be in the minds of prison officers a serious conviction that they are capable of being reformed, since no man can heartily pursue an object at war with his inward beliefs; no man can earnestly strive to accomplish what in his heart he despairs of accomplishing. Doubt is the prelude of failure; confidence a guarantee of success. Nothing so weakens moral forces as unbelief; nothing imparts to them such vigor as faith. "Be it unto thee according to thy faith," is the statement of a fundamental principle of success in all human enterprises, especially when our work lies within the realm of mind and morals.

10. The task of changing bad men into good ones is not one to be confided to the first-comers. It is a serious charge, demanding thorough preparation, entire self-devotion, a calm and cautious judgment, great firmness of purpose and steadiness of action, a keen insight into the springs of human conduct, large experience, a true sympathy, and morality above suspicion. Prison officers, therefore, need a special education for their work, as men do for the other great callings of society. Prison administration should be raised to the dignity of a profession. Prison officers should be organized in a gradation of rank, responsibility, and emolument; so that persons entering the

prison service in early life, and forming a class or profession by themselves, may be thoroughly trained in all their duties, serving in successive positions till, according to their merits, tested chiefly by the small proportion of re-convictions, they reach the position of governors of the largest prisons. Thus alone can the multiplied details of prison discipline be perfected, and uniformity in its application be attained. For only when the administration of public punishment is made a profession will it become scientific, uniform, and successful in the highest degree.

11. Work, education, and religion (including in this latter moral instruction) are the three great forces to be employed in the reformation of criminals. (a) Industrial training should have a broader and higher development in prisons than is now commonly the case. Work is no less an auxiliary to virtue than it is a means of support. Steady, active, useful labor is the basis of all reformatory discipline. (b) Education is a vital force in the reformation of the fallen. Its tendency is to quicken thought, inspire self-respect, incite to higher aims, open new fields of exertion, and supply a healthful substitute for low and vicious amusements. (c) Of all reformatory agencies, religion is first in importance, because most powerful in its action upon the human heart and life. In vain are all devices of coercion and repression, if the heart and conscience, which are beyond all power of external control, are left untouched.

12. Individualization is an essential principle of a reformatory prison discipline. To insure their highest improvement prisoners must, to a certain extent, be treated personally. While they are all placed under a general law, the conduct of each should be specially noted. The improving effect of such a verification, to each, of his progress in virtue would be great. It would be a first step toward restoring to him that feeling of self-respect, without which no recovery will ever be found permanent. Each should be enabled to know the light in which his conduct is viewed by those placed over him; for thus alone, as his good resolutions strengthen, will he be enabled to correct that wherein he may be found deficient. The statement of this principle affords an indication as to the maximum number of prisoners proper to be detained in a penitentiary establishment; but it by no means settles that question; nor indeed can such definite and positive settlement ever be arrived at, since the question is one which must necessarily be left to the judgment and convenience of each individual state or community.

13. Repeated short sentences are believed to be worse than useless, their tendency being rather to stimulate than to repress transgression in petty offenders. The object here is less to punish than to save. But reformation is a work of time; and a benevolent regard to the criminal himself, as well as the protection of society, requires that his sentence be long enough for reformatory processes to take effect. It is the judgment of this congress that every penal detention should have in view, above all, the time of the prisoner's liberation, and that the entire discipline of a prison should be organized mainly with a view to prevent relapses. If by a short and sharp first imprisonment it is important to give an energetic notice so as to prevent the propagation of evil, it is no less important afterward, by means of sentences of a longer duration, to prepare, in a manner more sustained and efficacious, the habitual petty transgressor for his re-entrance into society as a reformed, industrious, and useful citizen.

14. Preventive agencies, such as general education, truant-homes, industrial schools, children's aid societies, orphan-asylums, and the like, designed for children not yet criminal, but in danger of becoming so, constitute the true field of promise, in which to labor for the prevention and diminution of crime. Here the brood may be killed in the egg, the stream cut off in the fountain; and whatever the cost of such agencies may be, it will be less than the spoliations resulting from neglect, and the expense involved in arrests, trials, and imprisonments.

15. The successful prosecution of crime requires the combined action of capital and labor, just as other crafts do. There are two well-defined classes engaged in criminal operations, who may be called the capitalists of crime and its operatives. It is worthy of inquiry whether society has not made a mistake in its warfare upon crime, and whether it would not be better and more effective to strike at the few capitalists as a class than at the many operative plunderers one by one. Let it direct its blows against the connection between criminal capital and criminal labor, nor forbear its assaults till it has wholly broken and dissolved that union. We may rest assured that when this baleful combination shall be pierced in its vital part, it will perish; that when the corner-stone of the leprous fabric shall be removed, the building itself will tumble into ruins.

16. More systematic and comprehensive methods should be adopted to save discharged prisoners by providing them with work and encouraging them to redeem their character and regain their lost position in society. The state has not discharged its whole duty to the criminal when it has punished him, nor even when it has reformed him. Having lifted him up, it has the further duty to aid in holding him up. In vain shall we have given the convict an improved mind and heart, in vain shall we have imparted to him the capacity for industrial labor and the will to advance himself by worthy means, if, on his discharge, he finds the world in arms against him, with none to trust him, none to meet him kindly, none to give him the opportunity of earning honest bread.

17. Since personal liberty is a right as respectable as the right of property, it is the duty of society to indemnify the citizen who has been unjustly imprisoned, on proof of his innocence, whether at the time of his trial or after his sentence, as it indemnifies the citizen from whom it has taken his field or his house for some public use.

18. It is the conviction of this congress that one of the most effective agencies in the repression of crime would be the enactment of laws for the education of all the children of the state. Better to force education upon the people than to force them into prison to expiate crimes of which the neglect of education and consequent ignorance have been the occasion, if not the cause.

19. This congress defends as just and reasonable the principle of the responsibility of parents for the full or partial support of their children in reformatory institutions. The expense of such maintenance must fall on somebody, and on whom can it fall more fitly than on the child's parent, whose neglect or vices have probably been the occasion of its lapse into crime?

20. This congress arraigns society itself as in no slight degree accountable for the invasion of its rights and the warfare upon its interests practised by the criminal classes. Does society take all the steps which it easily might to change the circumstances in our social state that lead to crime, or, when crime has been committed, to cure the proclivity to it generated by these circumstances? It cannot be pretended. Let society, then, lay the case earnestly to its conscience, and strive to amend in both directions. Offenses, we are told by a high authority, must come, but a special woe is denounced against those through whom they come. Let states and communities take heed that that woe fall not upon their head.

21. The systems of criminal statistics stand in urgent need of revision and amendment. The congress judges it expedient and desirable that greater uniformity should be secured in making up the statistics in this department of the public service in different countries, to the end that comparisons may be the more readily made, that conclusions may be the more accurately drawn, and that criminal legislation may with greater safety be based upon the conclusions so reached.

22. Prison architecture is a matter of grave importance. Prisons of every class should be substantial structures, affording gratification by their design and material to a pure taste, but not costly or highly ornate. The chief points to be aimed at in prison construction are security, perfect ventilation, an unfailing supply of pure water, the best facilities for industrial labor, convenience of markets, ease of supervision, adaptation to reformatory aims, and a rigid, though not parsimonious, economy.

23. A right application of the principles of sanitary science in the construction and arrangement of prisons is a point of vital moment. The apparatus for heating and ventilation should be the best that is known; sunlight, air, and water should be afforded according to the abundance with which nature has provided them; the dietary and clothing should be plain but wholesome, comfortable, and in sufficient, but not extravagant, quantity; the bedsteads, beds, and beddings not costly, but decent, well-aired, and free from vermin; the hospital accommodations, medical stores, and surgical instruments should be all that humanity requires or science can supply; and all needed means for personal cleanliness should be without stint.

24. As a principle that crowns all and is essential to all, it is our conviction that no prison system can be perfect, or successful to the most desirable extent, without some central and supreme authority to sit at the helm, guiding, controlling, unifying, and vitalizing the whole. All the departments of the preventive, reformatory, and penal institutions of a state should be molded into one homogeneous and effective system, its parts mutually answering to and supporting one another, and the whole animated by the same spirit, aiming at the same objects, and subject to the same control, yet without loss of the advantages of concurring local organizations and of voluntary aid, wherever such aid is attainable and may be judiciously and wisely admitted.

25. This congress is of the opinion that, both in the official administration of such a system and in the voluntary co-operation of citizens therein, the agency of women may be employed with good effect.

§ 4. *Propositions embodied in the final report of the executive committee, and adopted by the congress as expressing its conception of the fundamental principles of prison discipline.*—The committee, after briefly reciting the history of the congress and setting forth the work done by it during its ten days' sessions, thus epitomizes the longer paper of the American delegation, and submits to the congress what in our country would be called the draught of its platform:

Recognizing as a fundamental fact that the protection of society is the object for which penal codes exist and the treatment of criminals is devised, the committee believes that this protection is not only consistent with, but absolutely demands, the enunciation of the principle that the moral regeneration of the prisoner should be a

primary aim of prison discipline. To attain this aim, hope must always be a more powerful agent than fear; and hope should therefore be constantly sustained in the minds of prisoners by a system of rewards for good conduct and industry, whether in the shape of a diminution of sentence, a participation in earnings, a gradual withdrawal of restraint, or an enlargement of privilege. A progressive classification of prisoners should, in the opinion of the committee, be adopted in all prisons.

In the treatment of criminals, all disciplinary punishments that inflict unnecessary pain or humiliation should be abolished, and the penalties for prison offenses should, so far as possible, be the diminution of ordinary comforts, the forfeiture of some privilege, or of a part of the progress made toward liberation. Moral forces and motives should, in fact, be relied on, so far as is consistent with the due maintenance of discipline; and physical force should be employed only in the last extremity. But in saying this, the committee is not advocating unsuitable indulgence, which it believes to be as pernicious as undue severity. The true principle is to place the prisoner—who must be taught that he has sinned against society and owes reparation—in a position of stern adversity, from which he must work his way out by his own exertions. To impel a prisoner to this self-exertion should be the aim of a system of prison discipline, which can never be truly reformatory unless it succeeds in gaining the will of the convict. Prisoners do not cease to be men when they enter the prison-walls, and they are still swayed by human motives and interests. They must, therefore, be dealt with as men—that is, as beings who possess moral and spiritual impulses as well as bodily wants.

Of all reformatory agencies religion is first in importance, because it is the most powerful in its action upon the human heart and life. Education has also a vital effect on moral improvement, and should constitute an integral part of any prison system. Steady, active, and useful labor is the basis of a sound discipline, and at once the means and test of reformation. Work, education, and religion are consequently the three great forces on which prison administrators should rely. But to carry out these principles individualization becomes essential; prisoners, like other men, must be treated personally, and with a view to the peculiar circumstances and mental organization of each. The committee need not say that to carry out such views prison officers are required who believe in the capacity of prisoners for reformation and enter heartily into that work. They should, as far as possible, receive a special training for their duties, and should be organized in such a gradation of rank, responsibility, and emolument as may retain experience and efficiency in the service, and lead to the promotion of the most deserving.

But if a sound system of prison discipline be desirable, it is no less expedient that the prisoner on his discharge should be systematically aided to obtain employment, and to return permanently to the ranks of honest and productive industry. For this purpose a more comprehensive system than has yet been brought to bear seems to be desirable.

Nor can the committee omit to say that it is in the field of preventive agencies, such as general education, the establishment of industrial and ragged schools, and of other institutions designed to save children not yet criminal, but in danger of becoming so, that the battle against crime is in a great degree to be won. In this, as in the general question of the reclamation of the guilty and erring, the influence of women devoted to such work is of the highest importance; and the committee rejoices that this congress has had the advantage of the presence and counsel of many ladies, whose practical acquaintance with prisons and reformatories has given weight to their words, and whose example furnishes hope for the future.

Lastly, the committee is convinced that the systems of criminal statistics now in force stand in urgent need of revision. Greater uniformity should be secured, and means taken to insure a higher standard of accuracy and trustworthiness in this branch of the statistics of different countries.

Mr. Hastings, of England, moved the adoption of the report, and in doing so expressed the hope that in any international scheme of prison statistics which might be devised, special care would be taken to insure the trustworthiness of the facts reported. At present, he said, such statistics are, in a great measure, delusive, because no guide is afforded by them as to the circumstances under which they were taken. Major Du Cane has pointed out that the number of reconvictions was but an imperfect test of any system. The question was, not what was the number of reconvictions, but under what circumstances did they take place? If we had to deal with a set of habitual offenders, we should most probably have a high rate of reconviction, whatever the system might be; whereas, if we have a large number of average criminals, the percentage of reconvictions would naturally be less.

Governor Haines, of the United States, said that he felt honored by being asked to second the motion to adopt the report. He did so with great pleasure. The propositions presented were comprehensive, yet specific; broad in their generalizations, yet sufficiently minute for all practical purposes. They constituted an organic rule of action, which, while applicable to all countries, was susceptible of adjustment to the special ideas and circumstances of each. They might be termed a constitutional law, to be applied and enforced by particular enactments. He hoped that the motion to adopt the report would receive the unanimous vote of the congress.

Miss Carpenter said it was impossible to exaggerate the importance of this congress and its work. It inaugurated absolutely a new era in the history of civilization. The chairman would recollect that, when many years ago he presided over a committee on juvenile delinquency, it was most difficult to persuade the members of the committee and the public that even children ought not to be severely punished for crimes, and their reformation was deemed quite a secondary consideration. As a witness she was asked, "Do you not consider that children who have broken the law owe retribution to society?" and her answer was, "Society owes retribution to them." She was proud of that answer. Its truth and justness have been substantially recognized by this congress.

The president, Sir John Packington, before putting the question, begged to remind the congress that the report before them was the unanimous report of an essentially representative committee, which consisted of one delegate from each of the many nations represented; the fact that, after many days' discussion by the congress of subjects of the deepest interest, as well as most complicated and difficult, such a committee had agreed unanimously upon a report of great breadth and comprehensiveness, claiming to represent the general sentiment of the congress on all the great questions considered and debated by it. This fact he considered one on which the body might well be congratulated as a satisfactory termination of its proceedings. Such unanimous agreement fairly justified the conclusion that the discussions had not been in vain. A body of men, occupying the best possible position for knowing the sentiments of the congress, and perfectly competent to understand them, had unanimously reported, as embodying those sentiments, a series of propositions, enumerating great principles, which covered almost the whole field of penitentiary science and prison discipline. It was, therefore, a matter of satisfaction and thankfulness that the interesting debates had not been unproductive of good result.

The motion on the adoption of the report was then put, and was agreed to without dissent.

§ 5. *Creation of a permanent international penitentiary commission.*—On the recommendation of the executive committee a permanent organization, under the above designation, was created, charged with the duty of watching over the general interests of international prison reform, but more especially with that of preparing formulas for the collection of penitentiary statistics, and seeking to secure their adoption and use in all countries. This commission is composed of the following gentlemen: Dr. Wines, of the United States, president; Mr. Beltrani-Scalia, of Italy, secretary; Mr. Loyson, of France; Baron von Holtzendorff, of Germany; Count Sollohub, of Russia; Mr. Hastings, of England; Dr. Frey, of Austria; Mr. Stevens, of Belgium; Mr. Pols, of Netherlands; Dr. Guillaume, of Switzerland.

It is understood that the first meeting of the commission will be held in Brussels, Belgium, during the month of September, 1873.

§ 6. Dr. Wines reported from the international executive committee a resolution of thanks to its chairman, Mr. Hastings, and moved its adoption by the congress. He said that the resolution had received the unanimous and cordial approval of the committee, whose members all recognized their obligations to their chairman for the dignity, courtesy, fairness, and ability with which he had presided over their deliberations. Although the congress could not know, as his colleagues knew, the value of his services in the committee-room, yet he felt sure that the whole house would concur with the members of the committee in the vote of thanks now proposed.

Archbishop Manning, in seconding the resolution, said that their thanks were due, not only to those who had come from all countries to the congress, but also to those who, being on the spot, had labored incessantly, not simply during the last three weeks, but for a long time past, in preparing for the congress. To them thanks were greatly due for their unwearied industry and close application, and, he must say, for the happy termination of the congress.

A member proposed to include a vote of thanks to Mr. Pears, secretary of the congress.

The chairman said he could not put these resolutions to the meeting without adding an expression of his own deep sense of the valuable and important assistance which the congress had received from Mr. Hastings and Mr. Pears, and his belief that, had it not been for the happy combination of zeal and ability which had distinguished their exertions, the proceedings of the congress would not have been so satisfactory as they had been.

The resolution was carried unanimously.

§ 7. Mr. Aspinall, of England, proposed a vote of thanks to Dr. Mouat, for the invaluable services he had rendered the congress in translating the many-tongued speeches which had been addressed to it. He had never met with a man who could translate every language into every other with such promptness, elegance, and force as Dr. Mouat, superadded to which the doctor had the great advantage of being thoroughly acquainted with all the questions which came before the congress for discussion. He felt sure that he need only name these things to call forth a cordial response from the meeting.

Baron Mackay, of Holland, in seconding the proposition of Mr. Aspinall, took occasion also to make recognition of the valuable assistance of Sir Walter Crofton and Major Du Cane. He represented a foreign legislature which had not yet adopted a system of prison discipline; therefore, he had listened with great attention to all proposals, and the arguments by which they had been supported, and he was sure that in his country the volume of transactions, which they would owe to the editorial care of Mr. Pears, would be carefully read and digested. England and Ireland were in possession of a system, but on the continent that compliment could be paid only to Belgium. This fact showed that the people of other countries had not yet made up their minds, and was in itself a justification of this congress. Differences of nationality could not account for the wide discrepancies of opinion and experience as to separate and associated confinement.

The motion was carried without dissent.

§ 8. Dr. Guillaume, of Switzerland, moved a resolution of thanks to Dr. Wines. His name was the first word spoken in the congress, and it should be the last. The conference had begun with him; and it should end with an acknowledgment of his efforts. He represented the Anglo-Saxon race, the champion of humanity and of all that concerned the

well-being of the human family. That race stood foremost in the new order of civilization which was dawning on the world, and by the arbitration at Geneva it had set an example to all countries of a pacific settlement of differences and the abolition of that greatest of crimes, war. Switzerland was grateful to England and the United States for having chosen it as the seat of that tribunal, and it was a good omen that Geneva, the cradle of the organization for the succor of the wounded on the battle-field, should be the scene of a great international arbitration. The abolition of slavery in America, the Geneva arbitration, and this great congress for the reformation of prisoners, were gratifying tokens of the new order of things.

Dr. Marquardsen, on behalf of the German delegates, seconded the motion. Before the congress met they all felt that Dr. Wines was the heart and soul of the undertaking; and, now that it had closed, they were sensible that to him they had been deeply indebted for its satisfactory progress and conduct. The German Parliament, of which he was a member, would shortly be engaged in framing a general law of prison discipline, and he doubted not that the law would show many traces of the beneficial results of this congress.

Sir John Packington, in putting the resolution, testified to the important part Dr. Wines had taken in convening and carrying on the congress. The motion was carried unanimously.

Dr. Wines said the remarks which had been made and the vote which had been passed were more than a reward for all the toil and anxiety which he had undergone during the three years he had devoted to preparing and organizing the congress. It had in all respects surpassed his expectations, and he assured them of his best wishes for the successful prosecution of the great work of penitentiary reform in the various countries whence they came, and which they so ably represented.

§ 9. Mr. Hastings, of England, proposed a vote of thanks to Sir John Packington, the president for the day. No English statesman could more fitly have occupied that position. Prior to being called on by his sovereign to those high offices which he had filled with so much honor to himself and advantage to the country, he was for twenty-five years at the head of the Worcestershire quarter-sessions, and was universally acknowledged to be one of the ablest and most competent chairmen that county ever had. His experience in all matters connected with the administration of the criminal law had been immense, and he had always advocated, in and out of Parliament, improvements in prison discipline, and every measure for the prevention of crime and the reformation of the criminal.

Dr. Mouat seconded the motion, expressing hearty concurrence in all that Mr. Hastings had said.

Mr. Hastings put the motion, and it was carried unanimously.

The president, in responding, said that he had been glad to be of any use in promoting the success of the congress. He hoped that the distinguished persons who had come from other countries, and had devoted their high character and ability to the promotion of the objects in view, would reflect with pleasure on what they had seen and heard, and would feel justified in thinking that the purpose of their mission had been as much forwarded as the short duration of the congress could have warranted them in expecting.

PART THIRD.

PAPERS SUBMITTED TO THE CONGRESS.

INTRODUCTORY.

A large number of papers was offered to the congress in the form of essays or discussions of questions connected with penitentiary science and prison discipline. The most of these were by specialists of eminence and ability in many different countries. A few of them were given, in full or in part, as opening addresses on the questions discussed in the congress, and the substance of all such is embodied in the summary of those discussions contained in Part Second of this report. To offer even a full analysis of all the others, however worthy they might be, (and certainly they are worthy,) would swell the present report to an unreasonable length. It was, therefore, necessary to make a selection, and the choice has been determined by some special novelty, either in the subject or its treatment, or by some peculiar characteristic of some other kind, which marked the paper with a special stamp. Another person would perhaps have made a different selection, and in doing so might have chosen more wisely; but this was a case in which it was impossible to consult the judgment of others, and the undersigned was forced to rely upon his own, however great might be the loss thereby occasioned to the reader. Moreover, he has felt obliged to limit himself to a moderate number of the essays submitted, and even these he will be constrained to condense as much as may be without injustice to the writers.

CHAPTER XXIII.

PRISONERS AND THEIR REFORMATION.

Mr. Z. R. Brockway, superintendent of the Detroit House of Correction, and one of the most eminent among the prison officers of America, communicated a paper on the subject which forms the title to the present chapter.

Civilized sentiment (he says in substance) concedes that the protection of society is the main purpose of imprisonment; but effective protection requires one of two conditions: the reformation of the criminal or his continued detention. Hence reformation is the immediate object to be sought. But doubt exists in many minds whether prisoners generally can be reformed, and even prison officers have little hope of this. The writer, however, believes that criminal law may be so reformed in its spirit and administration as to produce a soothing and healing, instead of an irritating and festering, effect upon prisoners, and restore a large proportion of them to society. The species of crime to which a person is addicted depends upon the circumstances which surround him,

or upon inherited tendencies, or both; but whether a man will commit crime at all depends, to a great degree, upon his constitutional characteristics.

Since the welfare of society is the true measure of every man's personal interest, it follows that a criminal act proves obliquity of some kind in the perpetrator—moral imbecility, incoherent mental development, feebleness of will-power. Nor is this to be wondered at, since criminals are so commonly without systematic education, by which alone the moral, mental, and volitional powers can be rightly and effectively trained. All who have studied criminals closely must have observed the undeveloped, incongruous, ill-balanced state of their higher powers, and the consequent sway of the animal instincts. Mr. Brockway says that he has been constantly surprised at the blindness of prisoners to the moral quality of their conduct. This undeveloped state, this paralysis, as it were, of the moral faculties, though, no doubt, largely due to the want of proper early education, he nevertheless believes to be often inherited from progenitors; and he adduces very striking statistics in support of this belief. Now, if there is a common idiosyncrasy among criminals, consisting in the activity of the grosser and more selfish impulses, and in the imbecility or absence of the moral, reflective, or volitional faculties, the writer asks, have we not found the right basis of a reformatory system, whose philosophy may be stated in the one word—*cultivation*?

Mr. Brockway discusses at considerable length the comparative merits of the Philadelphia and Auburn systems of prison discipline, and, while giving his preference to the latter, arrives at the conclusion that no system of imprisonment can regularly produce reformed convicts so long as the present or any like system of sentences prevails. He believes that the true remedy lies in the substitution of indeterminate or reformatory sentences in place of mere time-sentences. His personal experience, from recent legislation of his own State of Michigan, embodying a partial adoption of this principle, is altogether confirmatory of its truth and soundness, and demonstrates beyond contradiction the practicability of its application. He found that it tended to cultivate in criminals a kindly feeling for the law and its executors; and its effect, he argues, must necessarily be to increase for society protection from criminals, either through this continued restraint or their reformation, the latter of which objects cannot fail to be essentially aided by enlisting the active co-operation of criminals in their own improvement.

Mr. Brockway lays down the postulate that any change in the character and life of criminals must be effected by one of two methods: intimidation or education. Restraint by intimidation does not go to the root of matters; it touches only the surface, and must, therefore, be but momentary. Reformation, therefore, cannot be through intimidation; it must of necessity be the result of such cultivation of the mind and heart as is required to give the criminal knowledge and appreciation of the beneficent design and friendly protection of law, to supply better thoughts and impulses, and to invest with authoritative control the mind's legitimate sovereign, the will. The educational effort in prisons, if made efficient for reformation, must be broadly and thoroughly organized; it must be such as to develop and strengthen, not only the mental, physical, and industrial faculties of the prisoner, but also his moral and religious nature.

The effectual reformation of criminals requires: 1, a graduated series of penitentiary establishments, embracing a phase of the separate system, of the congregate silent system, and of the congregate social sys-

tem; 2, centralized control, with guardian care of discharged prisoners; 3, the principle of indeterminate or reformatory sentences; 4, industrial, scholastic, and religious education and culture; and, 5, a better public sentiment on the whole penitentiary question and on that of the laboring classes in general.

CHAPTER XXIV.

CUMULATIVE PUNISHMENTS.

A paper of high practical interest and value on this subject was contributed by Messrs. Clarke Aspinall, Edward Lawrence, and S. Grey Rathbone, on behalf of the Liverpool magistracy, England. They commence by reciting two resolutions unanimously passed by the magistrates, January 17, 1872, as follows: 1, that it is desirable that the cumulative principle be applied to the punishment of all classes of crimes and offenses; and, 2, that it is further desirable that the visiting justices (corresponding to our boards of prison managers) should be empowered to transfer well-conducted prisoners to homes for a short period prior to the termination of their sentences. These resolutions are followed by a table, showing the number of prisoners confined in the Liverpool borough-prison during the first six months of the official year 1870-'71, who had been committed fifteen times and more:

Fifteen times and under twenty.	Twenty times and under thirty.	Thirty times and under forty.	Forty times and under fifty.	Fifty times and under seventy.	Seventy times and upward.
Females 93	121	61	14	14	3
Males 32	28	12	1	4	1

The authors of the paper are strongly of the opinion, in which all reflecting persons must concur, that punishments should be gradually increased in severity, if offenses are often repeated. This opinion is based upon two grounds, viz: first, because long sentences would be more formidable, and therefore more deterrent to persons who had become indifferent to short ones; and, secondly, because such sentences would aid persons who had become addicted to a disorderly or criminal life to abandon it, by giving greater scope to the action of reformatory influences.

When the criminal laws shall have been amended in the direction indicated, so that terms of imprisonment of considerable duration are imposed on habitual petty transgressors, it is the opinion of the writers that the prison authorities should have power to transfer any prisoners, under proper limitations, to any home which is willing to receive them, and is at the same time under the management of a certified discharged prisoners' aid society. The advantage of such an arrangement would be that well-conducted prisoners could be selected and placed in such homes for some time prior to their discharge, in a state intermediate between the stringent restraints of the prison and perfect liberty. In such a state they would have better opportunities than can be afforded in a prison of exercising and acquiring habits of self-control, and of earning such a character as may facilitate their

obtaining an honest living when discharged. Several homes for adult discharged prisoners (the authors of the paper say) have been established, and, if successful, more would no doubt be opened by voluntary effort, and the expenses of adult prisoners would not be large, if the homes were well managed and placed in situations favorable for the profitable carrying on of the industries in which their inmates were occupied. The prisoners, knowing that if they did not work well, the managers of the homes would return them to the deprivations of a prison, *would have a potent stimulus to real industry*, for it would of course be one of the conditions of the transfer of a prisoner to a home that, if he or she became idle, disorderly, or discontented, the prisoner should be returned to prison for the remainder of the sentence. The writers suggest that the homes should not be largely, if at all, subsidized from public funds. Their utility will depend much on the labor in them being of the genuine kind, which would render them to a great extent self-supporting, and all or most of the deficiency should be raised by the managers, as a guarantee that they are really interested in the work. It would be far better that the growth of such homes should be slow and gradual, as the fruit of satisfactory experience, than that they should be prematurely forced into existence in large numbers by such liberal public grants as have been given to reformatories and industrial schools.

If the proposed amendments in the law were made, it is believed that the following results might be hoped for:

1. That the short sentences passed on young offenders would become much more deterrent, because they would be known to lead up to the really long sentences, which are unquestionably much feared by nearly all the criminal classes.

2. That under the influence of long detentions, when they became necessary, (particularly if part of the time were passed in well-regulated homes,) a certain proportion of the offenders would be reformed.

3. That the residuum of reckless incorrigibles would be detained in prison under a succession of long sentences instead of a succession of short sentences, from which the great advantage would arise that they would have fewer opportunities of committing crimes themselves and of training up others in bad ways, while the expense of their imprisonment would not be materially, if at all, increased, since the labor of long-time prisoners can be made profitable to an extent quite impossible in the case of short-time prisoners.

4. That the power of the police to enforce order and decency in the streets could be supported by the magistracy far more efficiently than under existing laws.

CHAPTER XXV.

THE TREATMENT OF PRISONERS.

The right honorable Sir Walter Crofton offered a valuable paper under the above caption. He lays down the proposition that the end of punishment is twofold: amendment and example. But it is difficult to embrace both these requirements in a system of prison discipline. A system of natural training from the start might amend individuals and reconcile the public to their employment on discharge; but how would

such a system prove exemplary to others? An artificial system, carried through from the beginning to the end, would be an example to the criminally disposed; but would such a system reform prisoners and further their employment on their release?

Reflecting upon these things, when called to preside over the convict-department in Ireland, he was led to discard each of these plans as a system complete in itself, for he felt that they would fail to attain the object in view, but that, as component parts of one system, definite and distinct in their several arrangements, both plans might be beneficially employed, and the one made so to lead up to the other as to give to the whole, in the mind of the criminal, the felt aspect of amendment. But in order to attain amendment, you must gain the co-operation of the criminals, to effect which they must realize that their punishment is not *merely retributive*, but that it has a benevolent aim, and that this aim is to improve them.

Long experience has enabled him to state that if this point is made sufficiently clear to the mind of the criminal at the commencement of the sentence, it will not be in hostility to those placed over him, even in the necessarily penal and more stringent stages of his punishment, for he will "look to the end," and hope will be ever present with him.

The solution of this problem, to his mind, lay in a classification which should lead, by successive stages, from very great strictness to a state of semi-freedom, in which the reformation of the criminal might be satisfactorily tested through the absence of the artificial restraints necessary in the earlier stages of detention.

To give to these stages in classification real value, it was necessary that self-control and self-denial should be developed in the process. To attain the object in view, the idle and ill-disciplined should become industrious and orderly. No plan could so well effect this result as marks, (introduced into Ireland in 1854,) or numerical records of labor.

But without associating industry in the minds of criminals with profit and pleasure, the marks would not be gained, and the end in view would be lost. As a general rule, it may be assumed that the criminal classes dislike labor. But if labor is made a *privilege to be earned* by its absence in the very earliest stages of seclusion and by its gradual introduction, coupled with other advantages as classification advances, it will by degrees, *slowly perhaps at first, but surely*, supplant idleness in the majority of criminals.

Those conversant with the plan of convict treatment introduced into Ireland in 1854 will at once perceive that the principles of prison training just sketched formed the basis of the system.

So far as the prison discipline of the system is concerned, we have, then:

1. The stage of penal and stringent discipline.
2. The stage of associated labor, (with separate dormitories,) in which, by means of progressive classification governed by marks, the industrial improvement and self-control of the prisoner are both stimulated and tested by the motive power which is at work, viz, improvement in present position and the opportunity of obtaining earlier liberation. It will be at once realized that thus the criminal, within certain defined limits, becomes the arbiter of his own fate, and the system is deprived of any aspect of vengeance, while it secures the co-operation of the prisoner in his own improvement. It is scarcely necessary to point out the self-drilling which is required under such a system, if the advantages held out by progressive classification are to be reaped.

When these two stages are satisfactorily passed—*i. e.*, when the crim-

nals have attained the required number of marks to entitle them to the privilege—they are removed to a stage of semi-freedom, called the third or intermediate stage, which is a stage of probation in a more natural state of training before liberation.

This stage of natural training in its very nature prepares the criminal for his return to the ordinary avocations of free life, and reconciles the public to his employment. As it has had the test of sixteen years' experience and has more than fulfilled what was expected from it, it must be looked upon as a great success. The conduct and industry of the inmates during this long period have equaled, and even exceeded, those of ordinary laborers in similar positions of temptation.

Sir Walter believes the above to be the best prison training to prepare a criminal for his release and his re-absorption into society. It is a training so simple in its principles that its very simplicity formed at one time its great stumbling-block in the minds of men, and so easy of application that, in some form, it is suited to every locality and every human being.

CHAPTER XXVI.

PREVENTIVE POLICE ORGANIZATION.

Mr. Edwin Chadwick, C. B., of England presented to the congress a paper of much ability and breadth on the question of a preventive police. One great object (he says) of a compulsory system of public relief for the destitute is to disarm the mendicant of his plea that, unless alms be given him, he must perish. Juvenile mendicancy leads to juvenile delinquency, and both are fed by indiscriminate alms-giving. English prisons were, at one time, filled chiefly with delinquents' orphans reared in mendicancy, who from begging advanced to stealing. Juvenile vagrancy and juvenile mendicancy are the great seed-plot of adult habitual criminality. Most of those who follow stealing as a business have mainly entered their careers as juvenile vagrants and mendicants. After having, with the aid of able colleagues, completed a report on a compulsory system of relief to the poor and after considerable experience in administering such a system, Mr. Chadwick became convinced that to attain the object of the law in regard to the great evil of vagrancy and mendicancy, as well as for other purposes, the concurrent action of a police was necessary. But beyond the metropolis there was no force in existence deserving the name of a police force. He therefore suggested to the government the expediency of instituting an inquiry into the subject. The result was that a royal commission was created for that purpose, consisting of himself, Colonel Rowan, chief commissioner of the metropolitan police, and Mr. John Shaw Lefevre, M. P. The leading results of this inquiry were embodied in Mr. Chadwick's paper, and submitted for the information of the congress.

The commissioners found, in the first place, that the gains of habitual criminals, as a rule, greatly exceeded those obtainable by honest industry, being in fact, on an average, about double. In the next place, they found that their average careers of spoliation upon the community, without interruption by arrest and conviction, were about five years in duration. More recently the estimate is that habitual depredators spend about one-third of their time in prison, and the other two-thirds at large,

plying their craft. The duration of these long careers of uninterrupted villainy are owing mainly to two causes: first, to the adroitness of the criminals; and, secondly, to the fact that the party robbed generally discontinues the prosecution on the restoration of the property.

Instances of the reformation of habitual thieves were unknown, and the possibility of such reformation was not believed in by the police. But proof was given that careers of habitual depredation had been discontinued because of difficulties which reduced the chances of escape and rendered such depredation less gainful than honest industry, as, for instance, highway robbery by mounted and armed horsemen. Evidence was given that there were house-breakers who had returned to honest occupations since the institution of the police, because the chances of escape had been so far narrowed that the business no longer paid. But if the chances of impunity were again lengthened from months to years, highway robbers, on foot and mounted, would re-appear, even though the gallows and the gibbet should re-appear with them. What is wanted, therefore, to check criminality, so far as objective agencies are concerned, is, not severe punishments, (these have little effect,) but few chances of escape, certainty of detection, short careers out of prison, and a reduction of the profits below those of honest industry. To leave the chances wide open, the careers long, and the profits large, and to rely mainly on punitive agencies, would be a wisdom akin to that of directing effort to the cure or alleviation of marsh-diseases and leaving the marshes undrained. The whole mass of habitual depredation exists through the defects of repressive legislation, and especially through the want of a properly-organized and systematic pursuit by an effective police force.

But the efficient action of a police depends upon the completeness of its information, and this again upon the effective co-operation of the public in supplying it. The commissioners found that the police are very incompletely informed of the number of depredations committed. They also found that the failure of the public to co-operate was owing in some degree to carelessness and a low morality, but much more to: 1, a dread of trouble and vexation arising from the cumbrous forms of penal procedure; 2, the absence of systematic public prosecution; and, 3, the fact that the charges of prosecution fall mainly on the party robbed, and this in addition to the loss and annoyance caused by the depredation. It hence follows that, for the efficient action of a police and a close and successful pursuit, a considerable reform in penal law and administration is necessary, as well as a more general and generous public support.

The chief objective points of a police are to render it difficult and laborious to get at property, to render it difficult and laborious to convert property when obtained, to render it difficult to escape detection; and in this way to narrow the chances of escape to the depredator, to shorten his career of impunity, and to reduce the profits of the career below those of honest labor. When these ends are attained, particularly the last, the predatory career will be abandoned. Crime for profit has subsisted and continues to subsist by the absence or inefficiency of systematic organization, devised with a view to detect and punish it.

The remaining portion of Mr. Chadwick's paper is mainly taken up with an account of the state of things in England and the reforms needed there, and has, therefore, little more than a local interest. He closes his essay with the statement that the first report of the commissioners was directed to the elaboration of the principles of the organization of a *preventive police force*, and that the said report has served very much

as a text-book for some of the imperfect organizations that exist, and that they have the material for a second report on the *preventive action* of a police when organized. It is much to be hoped that their second report will not be long delayed.

CHAPTER XXVII.

CRIMES OF PASSION AND CRIMES OF REFLECTION.

Rev. Dr. Bittinger, of the United States, submitted a paper to the congress treating of crime under the twofold aspect indicated by the title which forms the subject of the present chapter. The discussion was one of great originality, sharp analysis, and, withal, of a highly practical cast. The undersigned cannot but regret that an essay of such value should not have been given in full. But the respected editor of the Transactions, whose prerogative it was to decide upon questions of that nature, has inserted in his volume only a short abstract, and with that the undersigned must be satisfied. Dr. Bittinger's view, as epitomized in the Transactions, is, in substance, as follows:

Sin is the primal cause of lawlessness, but it is not amenable to human legislation until it finds expression in criminal acts. The two factors of crime are passion and reflection. The passions differ both in kind and degree: they are malign and non-malign. Reflection differs only in degree. Crime is punishable, because it injures society. The character and degree of the injuriousness of crime must determine the nature of our penal legislation; and the possibility of diminishing crime and reforming the criminal must determine the nature of our penal treatment. The enormity of criminal acts is modified by their relation to the person of the victim as nearer or more remote. Thus murder, rape, mayhem, malicious mischief, arson, and robbery have a closeness of relation to the person corresponding to the order in which they are named, and the same order marks the degree or intensity of guilt which attaches to the several acts. Another distinction to be made, which has been already alluded to, is between crimes of passion themselves, namely, crimes of malign passion, as murder, and crimes of non-malign passion, as rape. Acts springing from malign feelings are always criminal, while those springing from the non-malign passions are criminal only in their excess. The malign passions are in their nature objective, being always aimed at the person, as murder, mayhem, malicious mischief. The non-malign passions are, in their nature, subjective, their aim being ever the gratification of one's self, and not harm to another. The former are personal, the latter impersonal. The punishment of crimes of passion is aimed at the quality of the passion, as malign or non-malign. The punishment of crimes of reflection is aimed at the degree of reflection, as involving more or less of intelligence and purpose. Personality, as being that which tends most to excite and intensify reflection, is, in general, the measure of the offense as regards its guilt: larceny of detached property, pocket-picking, burglary, robbery, rape. The nearer the criminal gets to the person, the darker is the crime and the sterner should be the punishment. Crimes of passion are to crimes of reflection as 1 to 27. The most inveterate crimes of reflection are the following: Horse-stealing, burglary, robbery, forgery; and this is the order of their frequency as well as of their guilt. Of crimes of passion the order is murder,

rape, felonious assault. Statistics show that grave crimes of passion do not tend to repetition, while crimes of reflection tend strongly in that direction. Hence, crimes of passion are few, of reflection many.

For crimes of passion, preventive legislation is the remedy—

1. By improving the condition of the poor and degraded through work, education, and moral instruction and culture.

2. By protecting all classes through laws against drunkenness, gambling, and prostitution.

Crimes of reflection demand repressive and deterrent legislation—such as a vigilant police, certain detection, and swift punishment.

The penal treatment of both these classes should be framed on justice, as opposed to vindictiveness. Criminals have rights which justice must respect. The moral character of the jailor is of prime importance. The jailor and the judge are equally the ministers of justice. The prisoner's sense of justice must be respected by those who are charged with administering punishment, or his punishment will neither deter nor reform him. In dealing with professional criminals, justice may fitly be made to wear an aspect of severity, or at least of sternness; in dealing with crimes of passion, there should be a leaning toward mercy. The victim of passion is to be pitied; the criminal of reflection is to be punished. The man who does criminal acts under a sudden assault of passion leaves room for hope, for cooler moments turn him against himself and move him to repentance; the man who deliberates and plans his crimes is comparatively hopeless, because coolness is the essence of his criminality. The one is overtaken by crime; the other elects it. Criminals of passion have no accomplices, but often witnesses; criminals of reflection have accomplices, but seldom witnesses. The former rarely combine, and are without organization; the latter form themselves into communities, and organize for crime.

These characteristic differences between the two classes of criminals demand a corresponding difference in criminal legislation and penal treatment. Dr. Bitteringer in his essay explained why and wherein this difference of legislation and discipline, as applied to them, consisted. But the abstract in the Transactions ends at this point, and the undersigned is consequently unable to follow him further.

CHAPTER XXVIII.

JOHN HOWARD—HIS LIFE AND SERVICES.

John Howard entered upon his career as a prison reformer in the year 1773. It was therefore fit that an international penitentiary congress, convened in England ninety-nine years after that date, should be made the occasion of a centenary commemoration of the great English philanthropist. By special request, Rev. Henry W. Bellows, D. D., of the United States, delivered, during the sittings of the congress, a discourse on his life, character, and services, which was a worthy tribute to the man and the cause. The address of Dr. Bellows fills sixty pages of the volume of printed Transactions; it is evident, therefore, that the brief extracts to which the undersigned feels constrained to limit himself can give but a meager idea of the masterly analysis and glowing eloquence of the distinguished orator.

In one of the opening paragraphs of his discourse, Dr. Bellows thus speaks of its subject:

The name of Howard has become a synonym of philanthropy. It is more widely known, and known with more unqualified praise and honor, than any private name in modern history. Hundreds of associations for charity and beneficence have chosen it for their title. It has passed out of the keeping of his own countrymen into that of mankind. The lips of little children learn it almost next after that of their divine Master. Its glory belongs to neither sex, but celebrates virtues and graces equally honorable and acceptable in both. It is one of the few names religion dares to repeat in connection with her holiest themes. There is scarcely a shadow upon it. It mingles with all that is purest, noblest, most celestial in human feelings. It overleaped, even in the days of angry polemics, the walls of sect, and acted as a solvent of bigotry and a cement among theological rivals and antagonists. It stands for universal mercy, world-wide sympathy, and absolute consecration to human service. A name for mildness, self-forgetfulness, sleepless activity in benevolent work, for interest in the most abandoned and repulsive of our species, for hope toward those despaired of by all others, for chivalrous and heroic daring against enemies more perilous than artillery, but from whom even wisdom had accounted it universally permissible to flee—pestilence and crime; a name for humility which fled from the echoes of its own resonant goodness, wept at the praises it could not escape, and unaffectedly longed to be unknown. What a halo hangs around these syllables! Howard! If, as he himself declares, not one insulting word or disparaging and contemptuous act ever met his eye or ear in the sixteen years of his pilgrimage among the reprobate class confined in the prisons of all Europe, a hundred years, in which that name has circulated like a household word through the homes of civilized man, have hardly produced one jar or discord in the universal symphony of love and praise.

In the following sentences Dr. Bellows gives us Howard's own account of what first awakened his interest in prisoners and led him to a visitation of prisons:

Howard says that the first circumstance which excited him to activity in behalf of prisoners was in observing, when sheriff of the county of Bedford, that persons accused of crimes, but on trial found *not guilty*, or against whom prosecutors failed to appear, after having suffered previous to trial or arraignment months of unjust imprisonment, were often dragged back to jail and locked up until they should pay *sun-dry fees* to the jailer, clerk of assize, &c. He represented the hardship to the court, and begged that the jailer should have a salary in place of fees. The court was moved with the justice of the suggestion, but wanted a precedent for charging the county with the expense. Howard rode into several counties in search of a precedent, and his failure to find one did not prevent him from discovering the general sufferings of debtors and felons in all the prisons he visited, and waked up an earnest desire to alleviate what excited his pity and offended his sense of justice.

Dr. Bellows describes the zeal, activity, minute diligence, and scrupulous conscientiousness of Howard, in these words:

Howard had now become unsparing in the demands he made on his own diligence; he gave himself barely time to attend to his private obligations. He regarded neither distance, labor, nor expense in his investigations. Hundreds of miles, by post, on horseback, by night and by day, he hurried through England, Wales, Ireland, Scotland, the Isle of Wight, ubiquitous, making almost superhuman haste, and yet overlooking and forgetting nothing. A jail with one prisoner was important enough to draw him frequently to its inspection. He took nothing on hearsay; made no rough generalization; exposed himself boldly to jail-fever, small-pox, typhus, and every personal trial to which delicate sense or humane feelings can be subjected, that he might be able to speak with unanswerable authority on a subject which he had perfectly exhausted. Let us remember that this was not a time when immense accumulations of facts, exactly observed, had taken the place which they now possess, even in the physical sciences, much less in the moral. Howard's hunger for facts was unexampled in his time. He anticipated even scientific observers in rigor, exactness, hesitation to generalize, and patient waiting for an exhaustive examination of the field. This was partly due to the want in him of a discursive understanding or tendency to generalizing; the absence of a lively imagination and an intuitive perception; but still more to the scrupulous conscientiousness of his character, his inability to tell lies of carelessness, his plodding patience and utter self-forgetfulness in the pursuit of his ends. It is hardly too much to say, then, that every prison, bridewell, house of detention, sponging-house, in the three kingdoms, and every apartment in each of them, and every individual prisoner in every cell, had by this time been under his inquiring eye and had felt his influence. The whole race of prison keepers and jail authorities, as well as all the felons, convicts, and debtors had seen his face and felt the genuineness, the authority, and the strength of his purpose. What other man has made his personality for so many years so directly felt by the very persons for whose improvement and reform he was laboring? Asso-

ciated beneficence, deputed and vicarious sacrifices for the vicious, organized corporations for charity and for reform—we all know their necessity, their advantages, and their power. But do we not also know their limitations, their dangers, their exposures to superficiality and perfunctory work, their tendency to become at last only costly machines, run largely or mainly for the sake of the officers who administer them? John Howard was a sublime exception to the rule which trusts more to the machinery than the power that drives it; to the wheels, than the spirit in the wheels. His personal labors were as abundant as his public reports were few and far between; his inquiries as minute, special, and particular as they were numerous, broad, and universal. He swept the whole field, but it was as carefully as if it had been only a single threshing-floor.

This account is given of Howard's first publication of his work on the State of the Prisons of England and Wales, with Preliminary Observations, and an Account of some Foreign Prisons and Hospitals:

Never was so original and costly a work—costly in the personal sacrifices and severe labors it represented, original in being the record of one observer's personal study of a subject hitherto treated only in the library by philosophers like Montesquieu and Beccaria—issued with less pretension. Printed at the author's expense, in a provincial town—and, it may almost be said, without a publisher—given away mostly by Howard himself, it came out, without the smallest flourish of trumpets or the least aid from an expectant public, carefully manipulated by such a skill as now ushers works of importance into the reading world. And it was as modest in its pretensions, restrained in style and statement, free from rhetoric and false sentiment, as if it had been a legal document. Howard had a perfect eye for facts. He saw them, too, in a true perspective. He hated sentimentality and romance almost as he did falsehood. He was incapable, even had he been desirous, of arranging his observations in a pictorial or dramatic form. His work, therefore, is a plain, straightforward, condensed narrative of his observations upon the conditions of all the prisons he visited, with little generalization, no philosophy, and few other comments than those of a plain, practical man. But the vast accumulation of facts exhaustive of the subject is fitted to produce an effect which no abstract and no general inferences could possibly have accomplished. He really makes his reader a fellow-traveler, and, by inspiring him with absolute confidence in his scrupulous conscientiousness as an observer and recorder, he feels that his impressions from the book are nearly or quite equal in freshness and force to those an actual circuit of all the prisons in England and Wales, and of most in Holland, France, and Switzerland, would have produced. It may almost be said to have been the first successful attempt to arouse public opinion, independent of class or order, to a concern, on grounds of justice and humanity, in the treatment of a large and repugnant class of our fellow-men. It has become so common since, that the originality and boldness of Howard's course are not fully appreciated. Prior to that time, the appeal of all social reformers had been to scholars, philosophers, statesmen. Howard addressed the ordinary intelligence of tradesmen and the great middle class. He did not shoot an inch above their heads, and still less above their hearts. The narrative form of his book adapted it to its end, and nothing but its cumbrous size and cost prevented it from a still wider circulation.

Such self-denial, such purity of purpose, such self-subsistent efforts as Howard's could not but give an apostolic character to his reputation, disarm criticism, and almost place him and his work outside the common arena of judgment. It is not too much to say that his personal character, as exhibited in his work, was itself almost a new revelation of humanity; and so moved and amazed England, that the suggestions and wishes of such a working saint needed hardly any support except its own sublime simplicity and unparalleled devotion. Martyrs dying in the cause of religion the world had known, and soon failed to reverence. But saints living through labors and dangers and sacrifices such as Howard encountered, to soften the lot of the most degraded and opprobrious class of human beings—felons and murderers, thieves and robbers—and that without regard to country, race, creed, color, and at no possible advantage to himself—at his own risk and cost, and without any warrant or authority but his own will: this had made an impression on the English public which was unique, complete, and without deduction. And it is no wonder that Howard's work, though its circulation was necessarily limited, should, by the aid of citations in the public press, have created what came, as near as the condition of England then allowed, to a universal interest.

The concluding paragraphs of Dr. Bellows's address contain what may be called at once a comparison and a contrast between two of the most eminent and remarkable men of the eighteenth century. He says:

There are two characters belonging to the last century who may be said in different ways to have left a stronger impression on the world than any other two men of

their time, who were not connected with political, scientific, economic, or literary affairs; both Englishmen, both cosmopolites, and both originators of movements that have swept over the whole face of the earth, and drawn the admiration and sympathy of successive generations to their respective undertakings; both men whose influence continues and increases, and who have taken their places among the permanent ornaments and benefactors of their race: John Wesley and John Howard. Wesley the elder was born in 1703 and died in 1791. Howard was born in 1726 and died 1790, one year only before his great contemporary. They resembled each other even in person, both being men of light weight, spare, under-sized, and of ascetic and self-denying habits. Both were men unconformed to the world, and living habitually in view of another state of being; both intensely religious and Christian in faith and temper; both eaten up with a zeal for the welfare of their fellow-creatures; both self-subsistent and self-relying men, so far as dependence on human sympathy is concerned. Both were men of immense powers of work, who never spared themselves when personal sacrifices of ease, sleep, food, society, friendship, could advance their unselfish aims. Both possessed unflinching courage, and met the prejudices, passions, and perils of unpopular causes, and of rude and violent classes, with the firmest, calmest, and most controlling will. Both were equally marked by invincible convictions, a single and undeviating aim, an indomitable resolution which success could not intoxicate nor opposition tame. Both were practical men of great executive ability, aiming at clear and definite ends, with clear-cut purposes, and little embarrassed by speculative misgivings, self-distrust, or deference to others' opinions. Both relied mainly upon their own personal judgment, their own personal exertions, their own self-sacrificing spirit and labors for their success. Both were intensely protestant in their principles and intensely papal in their sense of infallibility—men who could only lead, not follow; govern, not obey. Both were wholly consecrated to their aims, above the temptations of riches and honors; holding pomp, place, ostentation, ease, money, applause, in contempt, and freely spending all they possessed or created, at the service of the needy. They both lived on horseback, and were, in an age of obstructed intercourse, ubiquitous—traveling by night and by day, with a speed practically equal to that which even modern facilities afford to self-indulgent travelers; careering through these three kingdoms, and into the remotest parts of the islands, in a way to make themselves equally at home in city and hamlet, among the rich and the poor.

Wesley is computed to have journeyed a quarter of a million of miles on his voluntary itineracy, chiefly on horseback; and Howard probably traveled in the same way, in a life twenty years shorter, half as far. But what he lacked in miles was made up in the variety of the countries he visited, the scope of the circuits he made, the character of the obstacles and perils he encountered, and the solitary nature of his pursuits. Considering that his public work was confined within sixteen years, was begun in middle life, and ended at the natural period of human existence, he perhaps exceeded in the intensity of his labors and sacrifices, for the time he was engaged in it, any equal period in Wesley's laborious life. But Wesley began his work at twenty-six, and continued it to eighty-eight, with almost equal spirit and activity from the beginning to the close—an unexampled miracle of toil and persistency.

Wesley encountered personal passions, hatred, scorn, violence, ignorance, and contempt; was pelted with stones and garbage, with lampoons and polemic abuse; had knives and pistols drawn upon him; encountered mobs and soldiery; was in frequent danger of his life. Howard faced dangers more fearful to brave men: jail-fever, pestilence, plague, and the apathy of all the best portion of society. Mobs and persecution might have supported his courage by the anger and defiance they rouse, but he needed no such stimulants. He was brave, without witnesses or visible enemies, without excitement or organized opposition; not braver than Wesley, for who could be? but as brave under more depressing circumstances. Wesley's weapon was his tongue, cloven with the flame of the Holy Spirit. With it alone he carved his way through all opposition, calming tumultuous mobs with its spell; subduing violent and wicked spirits with its divine meekness and power, and converting, like the first apostles, thousands in a day. And what his never-silent nor weary tongue did not accomplish, his ever-active pen did—keen, plain, with less ink and more blood in it than any pen that ever wrote so much—a pen that uttered things, not words, terse, unornamented, wholly to the purpose, vigorous, and decisive. Howard had no cunning in his tongue nor in his pen; not a man of thought nor of words, but a man of action; his weapon was an eye to see, to search, to penetrate to the very bottom, to pursue into every hiding-place the evil and curse that had aroused his mingled sense of justice and humanity. He hunted down the prison wrongs of the world with the chivalric devotion of a Spanish knight or the spirit of Sir Lancelot in solitary pursuit of the Holy Grail. He collected facts with the zeal, the labor, and the patience of a modern Darwin, in solitary explorations in distant countries whose tongues he did not speak, and from the deepest dungeons, the most poisoned plague-spots, the dreariest and most hateful holes, in which the moral and social fungi, whose natural history he sought, were to be studied and described. Slow and deliberate, cautious and intent, he spared no

pains, he shunned no dangers, he left unturned no stone, he hurried to no conclusion; he repeated his observations, examined and re-examined his facts; and then, without art, circumlocution, rhetoric, or self-display, mainly by the aid of others, laid them calmly before the little world who then read books, and left them to work their effects.

Wesley was an organizer of the first order. He knew how to win, how to hold, and how to use other men. Solitary in plan and purpose, he was eminently social in method and co-operative in means. He builded as fast as he collected materials. It was no disembodied, uninstituted work, the diffusion of ideas as a spirit, that occupied his formative and shaping brain. He was a churchman in every fiber, and he aimed at visible, methodic ends—the great methodist, who swept thousands of the ablest and most earnest souls of his generation into the ranks of his cause, organized them with an almost military drill, uniformed them with precise opinions, badged them with similar phrases and methods, and left them a distinct corps in the church militant, with a polity of their own, to make conquest at last of twelve millions of people, who are destined to multiply into scores of millions before the life Wesley gave them has found any superseding rival or absorbent. Howard was a prophet, and not a priest; a prophet of action, no organiser, no founder; an impulse; an example; an alarm-bell; a trumpet heard in the night. He was a sort of John the Baptist, his meat locusts and wild honey, crying in the wilderness, repent, repent. Solitary, difficult to work with, and wholly lonely in labors and in aims, he built up no work, he laid the foundations of no scheme, he became the architect of no system. But he drew the attention of the world and fastened it upon the cruelties, the inefficiency, and the inhumane and unchristian character of the dark prison territory. Nay, by his exalted devotion, the noiseless enthusiasm of his labors, the purity and intensity of his zeal, his absolute, uncalculating humanity, he made his name not only a landmark but an inextinguishable voice, which has ever since sounded through the nations, demanding attention to prisoners' rights and claims. He who can thus gild his own name with mercy and truth, until it shines over all lands with the glory of an unsetting constellation, who can turn its very letters and syllables into a universal language, until it becomes a spell, a synonym for humanity, a rally for the prisoner's relief, has joined the small company of the immortals in human history, and is among the saints, apostles, martyrs, who stand nearest to the Head of the glorious company in heaven.

CHAPTER XXIX.

THE PRISON OF GHENT.

M. Auguste Visschers, a jurist and philanthropist of great distinction and ability, was one of five commissioners named by the government to represent Belgium in the congress of London. Forbidden by his physician, on account of the state of his health, to leave home at the time of the meeting of the congress, he communicated in print a paper entitled, "Notice relating to the construction of the prison of Ghent, decreed by the States of Flanders in 1771, and to the two memoirs drawn up by the Viscount J. P. Vilain XIV, on the subject of the establishment of the said prison in 1771–1775, followed by some considerations on the progress and development of the penitentiary system." No more interesting or instructive paper was offered to the congress, yet, by some unaccountable oversight—for certainly there could have been no such design—it does not appear, nor is any allusion made to it, in the volume of Transactions issued by order of the body and edited by its secretary, Edwin Pears, esq., under the supervision of an English committee appointed for that purpose. For this reason, and because of the exceedingly interesting character of the information offered by M. Visschers in his historical essay, information so honorable to his country and to one of its eminent citizens, the undersigned has deemed it fit and desirable to give in the present chapter a somewhat extended summary of its contents.

M. Visschers divides his paper into seven sections, or, as he names them, chapters, each treating of a special department of his subject.

The first section treats of the state of society in the Belgian provinces, near the middle of the eighteenth century, and of the imperfection of its repressive laws. The author says that at this time the whole of Europe was desolated by the scourge of innumerable mendicants and vagrants, a scourge which the laws and customs rather encouraged than repressed. That enlightened and able Empress, Maria Theresa, moved by this state of things, sought to introduce remedial measures more effective than those previously employed. A letter of Prince Charles of Lorraine, governor-general of the Austrian low countries, dated August 2, 1765, called the attention of the privy council to the abuses existing in the administration of criminal justice, and particularly to the inefficacy of the punishments of whipping, branding, and banishment for the repression of crimes. M. de Fierlant resumed the discussion of these questions in the session of the privy council of April 13, 1771. He denounced infamous and torturing punishments, and advocated, instead, the immediate establishment of houses of correction, declaring that people without honor could not be restrained by the fear of infamy; that neither the scaffold, nor the scourge, nor the branding-iron could ever put an end to disorders which had their source in a dislike of work, and that the only means of correcting the indolent and the idle was to compel them to labor. M. Visschers cites two state papers of the Empress Maria Theresa, honorable alike to her intelligence and her humanity, in which she recommends the gradual abolishment of capital punishment, except in cases of atrocious crime, and the establishment of correctional prisons to take the place of these punishments. He mentions also another letter of Prince Charles of Lorraine, under date of May 11, 1772, pressing the work of building the prison at Ghent, agreeably to the plan of the Viscount Vilain, with separate cells for each prisoner, that it might serve as a model and an incitement to the other provinces.

The second section touches briefly on the principal events in the life, as well as on the more important writings, of the founder of the house of correction of Ghent, the Viscount J. P. Vilain. Born at Ghent in the year 1712, this great man passed through all the gradations of public honor and responsibility in his native country, ever showing himself able, wise, and faithful, and closed a career, at once useful and illustrious, in 1777, at the age of sixty-five years. His works were chiefly memoirs or essays on finance, economics, and penitentiary science, all of a practical character, all marked by broad common sense and a keen insight, and all intended to promote the highest interest and welfare of the state.

Section third enters into the heart of the subject, giving a most interesting *résumé* of the two memoirs of the Viscount Vilain, in 1771 and 1775, for the construction and internal arrangement of the house of correction. The first presents the basis on which the new establishment was to be founded. The second is mainly taken up with setting forth the rules and regulations of the house. In the former the viscount maintains that mendicity and vagrancy are encouraged and fostered by the hospitals and alms-houses intended for their relief and prevention, and that they form the seed-plot and nursery of theft and robbery. Of 64,681 paupers then found in Flanders, exclusive of the cities, fully one-half were able-bodied mendicants, imposters, vagabonds, wandering from village to village and committing all sorts of spoliations upon the honest people of the country. He says that for such offenses there were no punishments between fines and tortures, and asks why it would not be better to make of these sturdy beggars workmen useful to the public before

they became criminals. He then examines the question of cost, and concludes that the proposed house of correction would be an economic measure as compared with the expenses of justice and the losses occasioned by the spoliators.

The proposition received the assent of the states of Flanders and of the Empress Maria Theresa. It was determined, according to the recommendations of the viscount's report, that there should be a separate ward for able-bodied mendicants, a second for women, a third for laborers out of employment who desired work, and a fourth for the children of paupers. It was ordained, not only that there should be a separate establishment for each of these classes, but that each individual should be confined separately at night. The first three wards, radiating from a common center, were erected in the year 1772-1773, and provisional regulations for the discipline were decreed in February, 1773; but the general opening did not take place till May, 1775.

After two years' experience the Viscount Vilain presented to the states his second memoir, in 1775. The first was intended to prepare for the creation of the establishment, the second to consolidate it. In it he remarks that the punishments inflicted on the bandits who caused the honest laborer to tremble—exile, whipping, branding—effected no improvement in them, and were a remedy for nothing. The offenders rather grew worse. He believed it would be preferable to change these punishments to correctional imprisonment. There was, however, a peril to which the new experiment was exposed, that might prove disastrous; it was that of having too great a number at the beginning. Provision was made against this danger by the resolution to receive only a limited number, and to increase it when the first comers should be reformed and inured to labor.

The fourth section describes the plan and interior division of the house of correction of Ghent. The general plan was that of wings radiating from one center, five of which were completed in 1775 and the remaining three not until 1827. The first wing on the left, as you enter, was alone at that time used as a prison for criminals. The second was occupied by able-bodied beggars, misdemeanants, and disorderly persons. The third was appropriated to girls and women. The other two were destined to the reception of persons in want of work and to the children of paupers received on foundations or scholarships. Each wing had four stories, with stairs and the necessary private entrances. The whole structure was surrounded by an inclosing wall. Each prisoner was confined in a separate cell at night. The criminals' wing had two hundred and eighty-four cells, each seven feet long and five and a half wide. They were all of the same form and proportions, and all provided with the same furniture, viz: a bed six and a half feet long and two and a half feet wide, a paillasse, a mattress, a pillow, a pair of sheets, and two blankets in winter and one in summer. They were also provided with a vessel, a small bench, a hinge-table, and a closet in which the prisoners kept their effects. The ground-floor was occupied partly by the work-shops and partly by dark cells for the punishment of faults against discipline.

On the first story was the kitchen, with its adjuncts. The refectory, which was contiguous to it, was one hundred and twenty feet long and twenty-six feet wide; eighteen tables might be spread in it, with twenty covers each.

In the chapel adjoining the refectory was celebrated, Sundays and feast-days, divine service, at which all the prisoners were required to

be present, as well as at the sermon, and at daily prayers morning and evening.

The second structure, designed for able-bodied beggars and prisoners sentenced for minor offenses, was built and arranged in the same manner, with separate cells for two hundred and fifty.

The third wing, appropriated to young girls and women, was of the same dimensions, containing eight large apartments twenty-two by sixteen feet, and forty smaller ones, ten and a half feet in length by eight and three-quarters in breadth. The refectory for the women was of the same proportions as that for the criminal men.

The two remaining wings, and the three still to be constructed in order to complete the octagon, had a destination which attested the breadth of the views which presided over the conception of the plan. For the realization of the end proposed, it was expected that there would be a foundation of four hundred to five hundred scholarships, yielding annually 60 florins each. Already the states of Flanders had resolved to contribute to this foundation by establishing twenty scholarships. It was proposed to establish in the house of correction schools for the children of the poor and for apprentices in general, who, for want of sufficient means, were unable to acquire the knowledge of trades.

The broad views and large-hearted humanity of the Viscount Vilain are shown in his declaration that "this establishment ought to be looked upon by the public as a school or nursery of arts and trades for the relief of the really poor, who, deprived of resources sufficient to support their children, are obliged to let them languish in idleness and to make of them beggars, who, as a consequence, become onerous to the public and useless to the state."

To encourage this plan, the Empress decreed "that those who shall become most capable as workmen, shall be received into the trade-corporations of the towns of Flanders which they shall find convenient to their locality, without charges of any kind, and without being subjected to years of apprenticeship, but only to the production of a trial-piece, and that, in addition, they shall enjoy the rights of citizenship (*bourgeoisie*) without expense or formalities, in the towns where they shall become members of the trade-corporations."

The author of the memoir placed his supreme reliance upon this mode of encouraging labor; he sought to prevent crime by combating idleness. Private citizens had already announced their intention to found scholarships for the benefit of prisoners of this establishment; and, with a view to insure its success, the great Queen Empress had exhorted the bishops, the abbots, the spiritual corporations—in a word, all her subjects—to lend their aid in a project so excellent and useful.

In the fifth section M. Visschers treats of the administration of the prison, its discipline, and the management of its industries. The administration was confided, under the general direction of the states of Flanders and the special protection of the Empress, to a college of governors, composed of three deputies of the assembly of the states, one jurist, two notables, and four merchants. The Viscount Vilain was made a member of the college. The police and discipline of the establishment, and the reception, lodging, and conduct of the prisoners, were directed by officers who had under their orders various agents, and were themselves subject to the instructions of the deputies of the province. The management of the industries was confided to a director of manufactures, who had under him a number of foremen, and was himself guided by the rules and resolutions of the college of governors. An accountant kept the books. A surgeon was attached to the house. A

chaplain had his residence in the establishment. The Viscount Vilain says in his memoir: "Religion is not neglected in the prison; it is even made one of the objects of attention, and is never lost sight of. The change of manner, the quietness and submission of the prisoners, and their exemplary observance of the duties of piety assure us of the impression which has been made on the minds of many by pious exhortations and the word of God."

No prisoner was received except upon previous notice, given at least forty-eight hours in advance, and on the production of an authentic copy of the sentence of the judge or of the decree of commutation of afflictive punishments to imprisonment. At first no convict was admitted who was not able to work and to learn a trade.

The viscount gives formulas for keeping the registers relating to the general state of the prisoners, the trades at which they worked, and the product of their labor. *A special register showed the amount belonging to each prisoner of his share of his earnings.* Instructions are set down for the management of the hospital and the care to be given to the sick. A regulation of the 20th March, 1773, decreed by the Empress, fixed everything relating to the maintenance of good order and discipline.

One of the articles of this decree deserves to be cited at length, as showing at once the progress of humanity and the impossibility of wholly escaping the influence of the ideas and usages of the times. Article 26 reads thus:

As regards the police of the prison, we reserve it for a separate regulation, but in the mean time we declare that the directors, who shall be placed over the police, will not be permitted to inflict upon any prisoner graver punishment than that of confinement for two days on bread and water; and in case the offense merit a more severe correction, they shall report it to the first meeting of the administrators, who, on their part, will be allowed to prescribe only correctional punishments, such as being tied for some hours to a post, to receive *some blows with a stick*, which shall not exceed twenty-five, or of being confined for a moderate time in a *ribbed prison*—that is, on a floor with sharp edges, (*dans une prison à côtes, sur un plancher à arêtes vives*)—or for a few days in an ordinary prison on bread and water.

Article 27 also contains a remarkable provision, and one which must have been very sensibly felt by the prisoners when the time for their liberation came:

Every prisoner who, by resolution of the administrators, shall have been confined in a *ribbed prison*, shall remain, for each time that he shall have been so punished, eight days in the prison beyond his term.

On this the Viscount Vilain pertinently inquires whether, conversely, justice does not also require that the prisoner who shall have strictly observed the rules and regulations be rewarded therefor; whether it is not just that he who has shown zeal and exactness in the fulfilment of his duties, who has labored to reform his manners, and has mastered a trade that will insure him an honest living, should not be sooner restored to liberty. If bad conduct prolongs, ought not good conduct to abridge his imprisonment? The viscount adds:

The hope of shortening his captivity would be of the greatest service to him; it would be a strong motive to industry and good order; it would tend to beget and cherish in him a love of work; and it would certainly be a means of improving the discipline.

Vilain held and proclaimed the soundest opinions regarding the duration of imprisonments and the utter worthlessness of short detentions as an agent of reform. He says:

The administration will please observe that the term of six months is too short to reform criminals and train them to the love and practice of industry. These short-

term prisoners set a bad example to the others. They say that it is not worth the trouble of beginning an apprenticeship; and all their thought is directed to the termination of their imprisonment, that they may again return to a life of idleness.

These considerations lead him to the conclusion that the minimum of imprisonment should be fixed at a year. On the other side, he says:

A life-sentence reduces convicts to despair. Deprived of hope, they are indifferent alike to reformation and labor, and they turn their attention only to schemes of escape or revolt. Since we have not seen fit to deprive them of life, why should we seek to make it insupportable to them? Why not leave them the hope of re-entering society after expiating their crimes and rendering themselves worthy by assiduous labor and a genuine repentance?

The viscount, in his memoir, enters into the further inquiry whether, by the labor of the prisoners, the establishment may not be made self-supporting, and whether this same labor may not even be rendered a source of profit to the state without prejudice to free labor outside, and, in fine, whether the establishment of the house of correction sufficiently answers to the general desire of the public and to the end proposed, which is to dry up, or at least lessen, the sources of the evil, viz, idleness and vagrancy, so hurtful to the repose of society. He insists, above all, on the necessity of establishing in the house of correction manufactures and trades, which will assure to the prisoners on their liberation the means of an honest livelihood by their own labor. The aim is declared to be to impart a love of work, and to form them to habits of industry.

Finally, he proposes an establishment or school, under the name of hospital—a hospital for moral rather than bodily diseases—where the children of the poor will be reared and maintained in labor and good manners. The state, he says, is too much interested, has too deep a stake, in the extirpation of mendicity, not to make trial of this supreme agency to that end.

In his sixth section M. Visschers has collected divers honorable testimonies from various countries attesting the merit of the work so happily accomplished by the Viscount Vilain. The first and most important is that of the great English philanthropist Howard. He visited the prison in 1775-'76, and found there two hundred and fifty criminals—one hundred and ninety-one men and one hundred and fifty-nine women. Being present at the dinner of the male prisoners, he admired the regularity, decency, and order with which everything was done at the word of the director; not the least noise or wrangling was heard. He remarks:

This assemblage of one hundred and ninety criminals, robust and turbulent, seems to be governed with greater facility and less confusion than would be an assemblage of wise and educated men in civil society.

Eight small chambers or dungeons existed at that time for the punishment of refractory prisoners; but Howard found them always empty. He visited Ghent again in 1778. "I then saw," he wrote, "that the establishment was managed like a well-regulated manufactory. The prison population consisted of two hundred and eighty men and one hundred and seventy women. These last were engaged in making the clothing necessary for the house. Most of them, ranged in order, were spinning, knitting, or weaving, all attentive to their work and perfectly quiet. There was given to all, both men and women, one-fifth of their earnings. The specimens of cloth made there proved how much those are mistaken who think that no manufacture can be useful or prosperous which is carried on by hands imprisoned and forced to labor."

In 1781 he found the same care, the same discipline, the same dili-

gence, and the same progressive amelioration of the prisoners. There were two hundred and six male criminals, one hundred and six male delinquents, (including sturdy beggars,) and one hundred and fifty women, all occupied in divers manufactures or in the service of the establishment. The bread, soup, and meat were of good quality and in abundance. Everything announced the care and vigilant attention of the director.

I cannot but pause here for a moment to gather up and present to the admiration of all who read these pages the salient features of this remarkable experiment, conceived, inaugurated, and carried out to a complete success by Viscount Vilain, certainly one of the wisest and most gifted statesmen who have ever contributed by the light and warmth of their genius to the progress of humanity. Here we find, already discovered and applied a century ago, nearly all the great principles which the world even to-day is but slowly and painfully seeking to introduce into prison management. What are they? Reformation, as the supreme end to be kept in view; hope, as the great regenerative force in prisons; industrial labor, as another of the vital forces to be employed to the same end; religious and scholastic education and training, as a third force belonging to the same category; abbreviation of sentence and participation in earnings as incentives to be held out to prisoners to diligence, good conduct, and effort at self-improvement; the enlistment of the will of the criminal in the work of his own moral regeneration—his new birth to a respect for the laws; the introduction of variety of trades into prisons, and the thorough mastery by every prisoner of some one handicraft, as supplying the means of honest support after discharge; the use of the law of love and kindness as an agent of prison discipline, to the exclusion, as far as possible, of the grosser forms of force, which act upon the will mainly through the body; the utter worthlessness of short imprisonments, and the absolute necessity of longer terms, even for minor offenses, as the sole condition of the application to such offenders of reformatory processes; and the care, education, and industrial training of the children of the poor, and of other children addicted to vagrant habits, or otherwise in peril of falling into crime; an anticipation, in essential features and aims, of the industrial school and juvenile reformatory of the present day.

Howard revisited Ghent in 1783, but the prison was no longer what it had been. The Emperor, Joseph II, had yielded to the hostile representations of interested persons, who claimed that the prison labor offered an unjust competition with free labor outside, and had abolished the system of labor introduced by the Viscount Vilain and practised with such excellent effect. In consequence of this action of the Emperor, the manufacture, so useful and flourishing, had been destroyed, the trades abandoned, the tools sold, and the noble views of the founders of the house were, for the time, utterly thwarted and overthrown. But under the fostering care of the late able inspector-general of prisons in Belgium, Edward Ducpetiaux, the prison of Ghent regained in great part its former character.

In his seventh section M. Visschers traces briefly the progress of prison discipline during the last century, and gives an interesting *résumé* of the prison systems of different countries at the present time. As the result of this review, he thus expresses, in the closing sentences of his essay, his preference for what has become widely known as the Crofton prison system:

Progressive classification, with gradual amelioration of the prisoner's condition and augmentation of the pecuniary profits derived from his labor, has led to the discovery

of a new and fruitful principle, *emulation*. On one side, the convict dreads the consequences of every fault against discipline which would degrade him to a lower class; and, on the other, he sees the means of gradually improving his lot and hastening, perchance, the moment of his liberation. In the class to which he belongs, he has seen such and such comrades in toil, who, in recompense for their good conduct and diligence, have been promoted to a higher class. He says to himself that it depends upon his own will, upon the steadfastness of his efforts, to arrive at the same result.

Another consideration: We have observed how much deeper is the impression made by the divine word upon the heart and mind of prisoners when they are associated in worship. The same advantage is found in associated scholastic instruction.

But how great the difference for the convict, who must one day re-enter society, to have acquired the knowledge of a trade and to have labored under the ordinary conditions of life! It is a labor spirited, active, sustained; while, in the cell, after a sojourn too protracted, the convict knows only sadness, depression, and somnolence, and loses all energy, moral and physical. If, on his return to society, he must encounter the rough competitions of labor, if life itself has its asperities, will he be better prepared for these by a long sequestration? Shall freedom be given back to him without any tests to show whether he is able to bear it, or worthy to obtain it? Ought not society to exact guarantees sufficient, I will not say of his repentance, but of his good conduct, and his ability to henceforth lead an honest life?

It is in view of the happy results promised by the system inaugurated in Ireland by Sir Walter Crofton, and now introduced, with modifications, into the convict-prisons of England, that I give it all my sympathies, considering the ideas which belong to it to be as wise as they are well conceived.

The congress which is about to assemble will listen to the exposition and defense of all the systems. From its discussions there will flash a living light, which will penetrate two hemispheres, and contribute, no doubt, to elucidate questions which too long await a solution. I have desired to recall the point of departure, the attempts made, a century ago, toward the reform of prisons and the regeneration of criminals. The measures taken by the states of Flanders in 1771, under the inspiration of the Viscount Vilain, for the construction of the house of correction of Ghent, were marked by a wisdom which cannot be misunderstood—those measures which have borne fruits, whose excellence was recognized even by contemporaries. The men who have been benefactors of their age and their country belong to all nations in virtue of the ties of a common interest which unite all the members of the great human family. Is not the approaching reunion of the congress about to give the most illustrious example of this truth?

Let us place side by side these two memorable dates of 1772 and 1872, which will recall to our successors the erection of the first Penitentiary and the meeting of the great International Penitentiary Congress!

NOTE.

A paper of masterly ability and profound philosophical analysis was sent to the congress by Dr. Prosper Despine, of France, on the criminal himself, of which only a short and imperfect abstract was printed in the Transactions. The undersigned thought this essay of such exceptional value, because of its great originality and freshness, and still more on account of the just and practical views embodied in it and the scientific basis on which it seeks to build all prison management, that he translated and read it in the National Prison Reform Congress of Baltimore, held since the International Congress of London. As it will appear in full in the proceedings of the Baltimore meeting, no further notice of it need be given here.

PART FOURTH.

RESULTS OF THE COMMISSIONER'S PERSONAL OBSERVATIONS AND INQUIRIES RELATING TO THE PRISONS AND REFORMATORIES OF EUROPE.

INTRODUCTORY.

Both on his visit to Europe in 1871, to organize the Congress of London, and on that in 1872, to take part in it, the undersigned acted in a double capacity, being at once commissioner of the National Government and of the National Prison Association of the United States, and, on his second visit, being still further honored with a commission from the president of Mexico to represent the government of that country in the congress. He received, on the eve of his first sailing, the following letter of instructions from the Hon. Horatio Seymour, President of the National Prison Association, to wit :

UNITED STATES OF AMERICA,
New York, July 6, 1871.

SIR: As you have been designated by the National Prison Association of the United States of America as their commissioner and agent to arrange the preliminaries of an international congress on penitentiary and reformatory discipline, which is proposed to be held in Europe in 1872, it becomes my duty as president of the association to convey to you the wishes of the body touching the extent and scope of the work required of you, as well as the manner in which you are to discharge the duties of your mission. You are to proceed, then, to Europe at the earliest practicable moment, in fulfilment of the trust with which you have been charged.

If reforms in prison management are ever to be inaugurated, resort must sooner or later be had to governments, as legislation is the only means through which they can be effected. It has therefore been thought desirable that their co-operation in this work should be enlisted in advance. Hence, one of your chief duties will be to visit the several governments of Europe, to endeavor to awaken their interest in this proposition, and to induce them if possible to take part in the proposed congress by duly-commissioned representatives.

It is probable that the initiative of the United States in this project, and the official participation therein by the General Government, will smooth your path in approaching foreign governments, and materially aid the success of your mission. You will not fail to bring this point to their attention, and to press it upon their consideration as you have opportunity.

Another duty required at your hands will be that of visiting, inspecting, and examining as many of the penal and reformatory institutions of the several countries to which your mission shall extend as you conveniently can, in all cases carefully recording the results of your observations. You will also inquire into the prison systems of the different states of Europe, including the principles on which they are organized, their modes of administration and discipline, and the results accomplished through their agency. You will seek to secure the attendance at the congress of representatives from all the more important prisons and reformatories in each country.

A further object to be kept in view by you will be that of conferring with boards of prison managers, prison discipline associations, and other organizations having in view, wholly or in part, the promotion of reforms in this department of social science, and of procuring representatives to be sent by them to take part in the deliberations of the congress.

Another of your duties will be that of organizing, wherever you can, national committees, who will take charge of the whole business of making the requisite preparations for the congress in the several countries for which they may be appointed, and who will also prepare (to be read at the congress) brief memoranda setting forth the present state of the prison question in their respective nationalities.

As far as England and France are concerned, their national committees should be charged with the duty (if, as it is hoped, they are willing to assume it) of corresponding with the proper colonial authorities of their respective countries, and of securing representation from every colony subject to their authority.

An additional duty expected of you will be that of conferring with prominent persons abroad in regard, first, to the proper questions to come before the congress for its consideration, and, secondly, the proper persons to be invited to prepare papers upon the topics deemed most fit and necessary to be considered by the body. The object here will be to prepare the way for and facilitate the formation of such a programme of proceedings as may be judged best adapted to the ends in view in the calling of such a congress as the one proposed.

On the subjects above referred to, and such others as your own familiarity with questions and interests of this nature may suggest, you will make the broadest inquiries and gather the largest amount of information practicable, and will report fully thereon to the association on your return.

HORATIO SEYMOUR,
President of the Association.

E. C. WINES, D. D., LL. D.,
Corresponding Secretary and Commissioner of the National Prison Association.

All the points in the foregoing letter of instructions are covered in previous parts of the present report, except that which makes it the duty of the undersigned to visit, inspect, and examine, as far as circumstances would permit, the penal and reformatory institutions of Europe. To this work he was prompted as well by his own inclination as by the instructions of the president of the association. In obedience, then, to the dictates at once of choice and of duty, I personally examined, more or less closely, during my visits to Europe in 1871 and 1872, from fifty to sixty of the institutions referred to in the above-cited letter. Of these I propose to give, not a detailed description, for that would require both time and space not at my command, but some passing notice, in the chapters of this fourth part of my report.

CHAPTER XXX.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN IRELAND.

§ 1. *Convict prisons of Ireland.*—The penitentiary system, devised and carried into effect by Sir Walter Crofton in the convict-prisons of Ireland, has been so fully described in previous parts of this report, and has become in other ways so widely known, that I do not feel called upon to go into any detail upon the subject, and shall but briefly describe what I personally saw and heard during my visit to this now far-famed convict institution.

Penal servitude in Ireland, sentence to which is never less than five years, is undergone in three different stages and at three separate and distinct establishments. The first of these establishments is at Mountjoy, a suburb of Dublin, and consists of two prisons—male and female; the second is a public-works prison, on Spike Island, opposite Queenstown, at the southern extremity of Ireland, and more than a hundred miles distant from Dublin; the third is at Lusk, twelve miles from Dublin, and is what is called an intermediate prison. I spent a day at each of these establishments, accompanied throughout by one or the other of the two gentlemen composing the board of directors, viz, Mr. Murray or Captain Barlow—by the latter, however, everywhere, except at the male prison of Mountjoy. Every desirable attention was shown

me, and every possible facility afforded for the most thorough examination of every department of the convict service. I was permitted everywhere to converse freely with the convicts to any extent I desired, and that without the presence of the director who accompanied me, or any officer of the establishment; and I invited the confidence of the prisoners by the assurance that whatever they communicated would be regarded as strictly confidential, and should not, in any event, be reported to the authorities of the prison. Had I chosen to continue my investigations long enough I might, in this manner, have conversed with every inmate of every prison in the Irish convict establishment. As it was, I improved my opportunity to the utmost that my time would permit in conversing with a greater or less number of convicts in each of the three stages into which their imprisonment is divided. For a decade of years I had been a diligent student of the system, devouring everything I could get hold of on the subject. As far as books could teach it, it is scarcely an exaggeration to say that I knew it by heart. And I had done what I could to make it known to my countrymen. In my annual reports as secretary of the Prison Association of New York, in numerous short articles written for the daily and weekly press, in more extended essays published in the monthly and quarterly journals, in an exhaustive paper read before the American Social Science Association, in addresses made at public meetings in various parts of the country, and in private conversations without number, I had opened, explained, and commended this system in the clearest and strongest terms I could command. I had echoed and re-echoed the opinion of Italy's greatest statesman, the late Count Cavour, that the fundamental principle of this system—progressive classification based on merit, a progressive withdrawal of restraint and enlargement of privilege, as they should be earned and warranted by the prisoner's conduct, a gradual and almost imperceptible melting of prison life into the freedom of ordinary society through a probationary stage of natural training—that this principle, applied in some form, whatever the system adopted may be, is "the only efficacious means of discountenancing vice and checking crime, by encouraging, through agencies purely philanthropic, the reform of the criminal, without, however, holding from him his just punishment." And now I solemnly declare that the impressions received from published descriptions of the system have been, in the main, (I will not say without some modifications and abatements,) confirmed by personal inspection and study.

In the two prisons at Mountjoy—first stage—I saw the prisoners confined in separate cells, where they were kept on coarse and low diet, and employed at rough and uninteresting labor—oakum-picking and the like. This is the penal stage, and is intended, among other ends to be answered by it, to make the prisoner feel that the way of the transgressor is hard. Its maximum duration is nine months, which may by good conduct be shortened to eight. But hope is even here early planted in the prisoner's breast. The utmost pains is taken to explain to the convict, in the fullest and clearest manner, the entire course of his imprisonment, and all the advantages that will accrue to him, as he advances from stage to stage and class to class, from good conduct, industry, diligence in study, and attention to his moral improvement. Not only are these things set before each prisoner in his cell, but once a week there is held a kind of catechetical exercise on the subject, in which the convicts are questioned as to the completeness and accuracy of their knowledge in regard to it. According to the answers given, all errors are corrected and all deficiencies supplied. The effect, even in this penal stage, I

found to be hope, courage, cheerfulness, and a patient waiting for promised ameliorations. Indeed, these ameliorations begin during the period of cellular separation, and early in it. At first the seclusion is absolute. After a while, the cell-door is thrown open a part of the day, then all day. This slight approach to society is felt to be a great alleviation, and is withdrawn for any misconduct. From the first, the prisoners in this stage are together in chapel, school-room, and exercise-yard. Much attention is given to education and to moral and religious culture, wherein the "profiting" of the prisoners "appeareth unto all men," who have opportunity of observing it.

The day passed at Spike Island, where the second stage of imprisonment under the Crofton system is passed, was one of great interest to me. This may be properly designated as the reformatory stage, for it is here that the principle of progressive classification is applied and exerts all its force, having no existence in either the first or third stage. There are four classes here, arranged in this order: third, second, first, and advanced or exemplary. Promotion is determined by marks, of which the convict can earn a maximum of nine per month, viz, three for general good conduct, three for industry, and three for school duties—not actual progress, but attention to lessons and the desire shown to improve. On his transfer from Mountjoy to Spike Island, the convict is placed in the third class; 18 marks must be earned in order to his promotion from the third to the second class; 54 for promotion from the second to the first; and 108 for promotion from the first to the advanced or exemplary class. Thus the minimum time in the third class is two months; in the second, six; and in the first, twelve. The time necessary to be passed in the advanced class before removal to Lusk is not a fixed period, but depends upon the length of the prisoner's sentence. With a five years' sentence, he must remain in this class fourteen months; with a fifteen years' sentence, he must remain five years and eight months; and with a sentence between these two extremes, a period varying with its length. I was surprised to learn that a majority of the convicts earn the maximum of marks, and of course secure their promotion from class to class, and finally their transfer to Lusk, within the minimum period. But hope has a quasi omnipotence.

On the day of my visit to Spike Island, the number of prisoners was 705, distributed as follows: advanced class, 320; first class, 200; second class, 101; third class, 84. The motive to strive for promotion is not only powerful, but it is constant, and constantly increasing in strength. The progress toward liberation is the great motive-power; but there are manifold inducements to exertion, self-denial, self-conquest, and self-control besides this. With every advance, there is a lifting of restraint, an enlargement of privilege, an increase of gratuity, distinctive badges, better food, improved dress, greater liberty of action. The great effort is to induce the prisoner to become the chief agent in his own reformation. The authorities seem to feel that unless this is done, nothing is done. The result, as I learned it from the lips of many prisoners with whom I conversed—all separate and apart from their officers—is that the entire prison population, with few exceptions, are putting forth constant and vigorous effort to secure their promotion within the minimum time; that Lusk is ever in their thought and on their tongue; and that the hope of attaining that coveted goal, and a respectable position as honest laborers beyond it, keeps up heart in them, and produces alacrity at work and a constant flow of good spirits.

The men are nearly all employed on public works—quarrying and dressing stone and building docks. Their work is consequently in the

open air, and a busy set of fellows I found them. I never saw men either more industrious or more cheerful in their industry. They were doing quite as much as any free laborers outside would have done at the same kind of work, and a great deal more than the free laborers at that time employed on the island were doing. Still I would much rather have seen them at trades, with a free choice, among twenty or more, of which they would learn.

Mr. Hays, the active and able governor, allows any and all prisoners to come to him in his office at 6.30 a. m., with their burdens and grievances. From twelve to eighteen visit him in this way every day, and he allays their agitations and composes their difficulties. The effect, he informed me, is excellent. At 7 he holds a kind of court, at which the warders bring in their reports against any prisoners who may have been guilty, or who are by them regarded as having been guilty, of violating the prison rules. Of this class of cases he has some four or five every morning. He keeps a record of them in a book with the following headings: 1. Registered number of prisoner. 2. Name. 3. Date of report. 4. Nature of charge. 5. By whom reported. 6. Summary of evidence. 7. Explanation offered by prisoner. 8. Decision of governor. 9. Date of decision.

The punishments here are chiefly of a moral kind: loss of marks, forfeiture of gratuities, withdrawal of privileges, change of badge, degradation to a lower class, remanding to the cellular prison at Mountjoy, to which may be added (as punishments occasionally employed) deprivation of a meal, close confinement on bread and water, and even, in aggravated cases, the lash, which, I trust, will soon be banished in *sæcula sæculorum*.

The day I passed at Lusk was a day of mingled wonder and delight. This is the intermediate prison, so called because it holds a middle ground between an imprisonment strictly penal and the enjoyment of full liberty. The aim of the intermediate prison is twofold: first, to test the reality of the convict's reformation, his power of self-government, his ability to withstand temptation; and, secondly, to train him for a considerable period—never less than six months—under natural conditions, and so to prepare him for full freedom on discharge by the enjoyment of partial freedom as a preliminary step. Accordingly, the imprisonment here is little more than moral.

I had known this part of the Irish convict-system, as I had the others, from books. My expectations regarding it were high, but they were more than met. Indeed, I have never elsewhere seen anything to compare with the results shown here. The intermediate prison which formerly existed at Smithfield, in the outskirts of Dublin, has been given up, and all intermediate prisoners are now sent to Lusk. The number, on the day of my visit, was fifty-seven; the usual number is a little in excess of that figure.

Farm-work is the only industry from which income is received, and the cash revenue from this source, over and above the value of the products used in the establishment, amounts (at least such is my understanding of the matter) to about \$10,000, which makes the institution well-nigh self-supporting. The farm contains nearly 200 acres. Prior to the establishment of the prison, this land was a common, wild and uncultivated. The whole of it has now been subdued, and brought under successful and profitable tillage. The value of the land has increased under the labor of the prisoners, from 10s. to £5 per acre. There is a large annual hay-crop gathered; wheat, oats, and barley are grown in considerable quantities, but the principal products

are potatoes, cabbages, turnips, celery, and other vegetables. It was the 14th of October when I was there, and the prisoners were at work on various parts of the farm, digging esculents, hauling and spreading lime, and performing other kinds of farm-labor; and a half dozen or more were engaged in the construction of a stone dwelling for the superintendent, in place of the iron hut which at that time served him for a residence. Everywhere they were as busy as bees, and, to all appearance, as happy. I never saw a brisker or more cheerful set of laborers. They accomplish fully as much work as an equal number of free hands. Indeed, the farmers of the neighborhood aver that they would be glad to get men who would work as well. For the most part they work in groups, and have a warder to oversee them, who is, however, at the same time, a fellow-laborer with them. But this is not always the case. Often they work alone, or in companies of two or three, without any one in charge, on the most distant parts of the farm. As far as appears to the view, there is no more imprisonment here than on any other farm. There are no walls, no bars, no bolts, no gratings, no apparent confinement of any kind. The doors of the iron tents which serve them as dormitories are locked at night, just as our own houses are when we retire. The only difference, as far as I could see, between this and any other large farm employing a great many hands, was that here a warder slept in a small room at the end of the large dormitory of the convicts.

In the afternoon I walked about the farm, mingled freely with the convict laborers, and talked with quite a number of them entirely apart from the officers. Their uniform testimony, the truth of which was attested by their whole tone and bearing, was to this effect: That the hope held out to them of constantly bettering their condition by their own exertions was, throughout the whole course of their imprisonment, a powerful stimulus to good conduct, industry, and exactness in the discharge of all their duties; that the intermediate prison was the goal toward which they had been constantly aiming, the object of incessant desire and effort; that at Lusk they never heard any plotting of future crimes; that, on the contrary, all the talk of the men in that prison, when the time of their liberation was drawing nigh, was as to where they would go, what they would do, what wages they might be able to obtain, and how they could win honest bread and an honorable position; that a profane or obscene expression was scarcely ever heard there; and that if such a thing chanced to occur, as it sometimes did, it was instantly frowned down and put a stop to by the prisoners themselves. Yet there is no restraint upon conversation at Lusk more than there is among the laborers on any large farm or other well-regulated industrial establishment. Lusk has now been nearly twenty years open for the reception and treatment of intermediate prisoners, with opportunities of evasion, such as no other prison in the world offers, and yet scarcely have a dozen attempts at escape been made. The whole vicinage was in terror at the announcement that a prison without walls or bolts was to be established on Lusk Common; yet only one complaint, in all these years, has been made against the prisoners who have found a home there. That happened on this wise: There is no chapel on Lusk farm, and the prisoners attend the parish church on Sunday in a body. On one occasion a prisoner, in leaving the church at the close of the service, addressed a passing remark to a young woman at his side. There was no pretense that the word spoken was in itself an improper word. The complaint was that he spoke to her. There is no *discipline* at Lusk; no punishments are administered there any more than on a farm or in a manufacturing establishment where free laborers are employed. The prisoner was,

therefore, sent back to Mountjoy, from which, after a month's "separate and solitary confinement," he was restored to his place on the prison-farm, and neither before nor since has complaint been made by any human being against the inmates of the intermediate establishment, a fact, to my mind, truly marvelous.

During my visit, the entire prison population was called in from their work to allow me to see them in their school, and especially to witness one of those competitive examinations, conducted by the prisoners themselves, which became so marked a feature of the intermediate prisons under the late Mr. Organ. As the men came in, there was nobody in the room but myself, not a single officer being present; yet so quietly did each prisoner enter, go to his own desk or table, take out his book and commence his studies, that, if my eyes had been closed, I should scarcely have supposed that a half dozen persons were in the room; certainly I could not have dreamed that nearly sixty men had entered. Not a word was spoken; not a disorderly or even playful act was done; nor was there the least confusion or noise of any sort. The men were arrayed in two long rows on either side of the room, and, under the superintendence of the school-master, the two sides put questions alternately to each other. The exercise was an interesting one, but less so than I had anticipated. It had somewhat the appearance of being, as we say, "cut and dried." Mr. Organ is dead, and his successor, in the lecture department, has not yet been found. Speaking of Mr. Organ, who, for a dozen years or more, held the double office of superintendent of discharged convicts and lecturer to the intermediate prisons of Lusk and Smithfield, I cannot close my brief account of the visit made in 1871 to the convict-prisons of Ireland without citing a few sentences from one of the last reports, if not indeed the very last, made by him before his lamented death. He says:

Crime is fast disappearing in Dublin. Old and habitual thieves are becoming honest and industrious citizens, while homes, which have hitherto been the scenes of vice and poverty, are now replaced by those of morality and plenty.

• Employers continue to repose confidence in my men, and the demand for them has at times exceeded the supply.

The moral tone of the institution is most satisfactory. There is an entire absence of even the slightest tendency to immorality, whether in word or act; and should hypocrisy show itself in a new-comer, it is promptly detected, and as promptly censured by the public opinion of the men in the huts.*

I cannot speak too highly of the charming effects which farm-labor has produced, even upon the most sluggish criminals, nor of its happy results on even the cool and calculating adept in crime, on whose brow the honest drop of sweat had never before trickled.

I am ready to stake my reputation on the fact, proved in innumerable instances, that the most indolent criminal can be trained to honest and independent toil, not so much through fear or coercion, as through the influence of hope and encouragement.

Truly Lusk is a magnificent triumph of reason and humanity over coercion and brute force—a splendid and irrefragable testimony to the soundness of the penitentiary system which the genius of Sir Walter Crofton has given to the world.

§ 2. *Juvenile reformatories of Ireland.*—Ireland is now well supplied with this class of institutions, both Catholic and Protestant. Only one of them, however, was visited by me; and to that I shall confine my remarks, which, for the rest, will be very brief. I was accompanied by Mr. John Lentaigue, the intelligent and amiable inspector of reformatories for Ireland, and two other gentlemen, friends of his. The institution visited is the St. Kevin's reformatory, for the treatment of delinquent Catholic boys exclusively, and is the largest of the kind in

*Mr. Organ refers here to the two iron tents at Lusk, erected at a cost of only \$3,000 each of which is, nevertheless, capable of accommodating fifty convicts.

Ireland, having an average of more than three hundred inmates. It is distant ten miles from Dublin, the road ascending nearly all the way, and at a pretty steep grade, as the reformatory is 1,800 feet above the level of the sea. It is situated at the head of a romantic and picturesque glen, called Glencree, or the Valley of the Heart. The name is most appropriate, as being significant of the spirit of love and kindness in which such institutions should be conducted. But, for all that, the place has not, in my judgment, been well chosen. The soil is of the worst possible description, the greater part of the one hundred acres rented for the use of the establishment being utterly irreclaimable and worthless; and even on the forty or fifty acres that have been brought under tillage by the labor of the boys, little will grow except grass. The cold in winter is often intense and the storms terrific. It is but a few years ago that a juvenile convict, on his way to the reformatory, was frozen to death before reaching it. All supplies for the institution have to be hauled on carts or wagons ten miles up a mountain, and all manufactured articles, seeking a market, the same distance down it. Yet, despite all these disadvantages and drawbacks, the Glencree reformatory is doing good work. Father Fox, born and reared in the Quaker faith, (and none the worse for that,) is at the head of it; and he impressed me as being—if I may be allowed a hackneyed but expressive phrase—pre-eminently “the right man in the right place.” At all events, he and his indefatigable corps of assistants have shown themselves greatly successful as regards the main purpose of their work. If the acres on which the boys are placed have proved, in large measure, irreclaimable, the case of the boys themselves has been quite different. Ninety per cent. of these are reformed, and, on their liberation, become a constituent part of the industrious and honest yeomanry of the country. That tells the whole story more eloquently than I could; and all further words may be spared.

CHAPTER XXXI.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN ENGLAND.

§ 1. *English prisons.*—In the course of my two visits to England I had opportunity to examine more or less thoroughly four convict-prisons and some ten or twelve county and borough jails. Compelled to study, in what remains of my report, a rigid economy of both time and space, I can give to these establishments only the most cursory notice—far less, indeed, than either their merits demand, or my own feelings would prompt. There is much in the English prisons and the English penitentiary system to be admired, commended, and imitated; but there are, also, as I conceive, things in them to be criticized and avoided; things, too, which belong to the very core and essence of a just and especially a reformatory prison discipline.

The prison buildings in England, as a rule, are substantial structures of stone or brick, on the radiating plan, well proportioned and pleasing to the eye, with a lofty tower attached, for purposes of ventilation; the grounds are handsomely laid out in parterres and gravelled walks, and many of them ornamented with flowers, vines, and shrubbery; halls, running through the center of each wing, are lighted from the top, and the light is so disposed as to produce a soft and cheerful effect; the cells are spacious, airy, and well lighted, each having a water-closet, gas-burner,

and bell-pull, with an iron card attached to it by a spring, which starts out from the wall on the ringing of the bell, and each is also provided with all needful furniture; the long galleries, tier above tier, impart a feeling of perfect adaptation to their special object, which is far from unpleasant; the chapels are generally of ample dimensions, of gothic architecture, with groined roofs, always neatly and sometimes beautifully arranged, and well suited to produce a solemn and soothing effect upon the prisoners; an extraordinary cleanliness reigns throughout—in cells, corridors, offices, everywhere—and one is particularly struck with the brightness of the brass-fittings and the polish of the metal stair-cases; the hospital accommodations are excellent, the wards being well arranged for the treatment of different classes of disease, and all the appointments adapted to the convenience, comfort, and cure of the patients; the ventilation, drainage, and all other sanitary arrangements are the best that science can supply; the discipline is exact, and is rigidly enforced; obedience is prompt, and order and decorum everywhere observed; and there is a certain charm in the symmetry, harmony, and clock-like regularity of the whole, which takes away, at least from the first view, the awe and horror anticipated by the inexperienced observer.

Such, in brief, and without any attempt to exhaust the attractions of the picture, is the bright side of the English prisons, whether convict, county, or borough. But, unhappily, there is a *per contra*. While the material efficiency of these prisons is certainly very high, the moral action seemed to me feeble. While the avowed end of all prison authorities—or nearly all—is “reformation,” it appeared to me doubtful whether they fully appreciated what that work demands. The whole aim and instinct are for material efficiency. Hence—so it seemed to my apprehension—the shell is preferred to the kernel; the forms are made of more account than the substance. Hence, too, reformatory discipline is, to far too great an extent, made secondary to punitive inflictions. Consequently the men chosen for officers—though, as a class, superior, I freely admit, to the same class among us—are often not of the sort required for the work to be done. They are too artificial, keep the prisoners too much at arm’s length, rely too exclusively on authority, have too little faith in the susceptibility of criminals to reformatory agencies, and hence work but feebly—and, as a consequence, with little effect—to that end. In a word, they are not such—at least the greater part are not—as can subdue, control, and change the prisoners by moral influence. Though the governors are generally men of ability, character, and culture, all are not such. Some are unfit for their posts. There should therefore be some means devised for testing the deserving among these and other officers; some mode adopted whereby rewards and preferments may be given to the meritorious, and the unfit and unworthy removed from their offices.

Too little account, speaking generally, (there are honorable exceptions,) is made in English prisons of industrial and skilled work; too much of wasted labor, in its many forms. Tread-mill, crank, shot-drill, stone-breaking, and costly usages of that sort prevail, and the reasons assigned for their use are apt to be given in such catch-words as these: “Ancient prestige,” “nothing to be learned from theorists,” “practical men,” “not presume to be wiser than our forefathers,” “productive work injurious to honest outsiders,” &c. I am sorry to differ from some most excellent English friends, (though, I am glad to add, supported by a host of others,) but I altogether disapprove of mere penal and unproductive industry as irritating and brutalizing to prisoners. The introduction of trades, as many as possible, coupled with

longer sentences in the country and borough prisons, seems to me at the present moment a great want in England. Special prisons might, perhaps, be usefully employed for special trades. I should think it most desirable to *multiply* trades, so as to insure, as far as possible, that every prisoner should learn a way of getting his bread according to his turn; and to this turn the aptitudes and tastes of individuals should be particularly studied. Some liberty of choice should be given in this matter, even to prisoners; it would be a great step toward the restoration of their manhood. An incidental advantage of the multiplication of trades would be that it would tend to stop the mouth of those who complain of the competition of prison labor with free labor, though really there is scarcely enough in that argument to merit a refutation of any kind. But for its practical effect on prisons and prisoners, it might be given to the winds.

Scholastic education in English prisons receives more or less attention; in the government or convict prisons, much care is given to it. But everywhere it needs a broader development, a higher activity.

Twenty years ago boys were mixed with men in the English prisons, and came out old knaves, skilled, theoretically, in all the devices of practised villainy. This is no longer so. But the principle of progressive classification, by which prisoners, on the ground of merit, are advanced from stage to stage, with constantly diminished restrictions and constantly enlarged privileges and comforts, is not widely applied in county and borough goals; nor, indeed, can it be, until the principle of cumulative sentences is incorporated in the penal code. In the convict establishments, known as public-works prisons, progressive classification exists; but promotion is earned by industry alone, all other qualities and efforts being thrown out of the account; a grave mistake, in my judgment; though in part repaired by a forfeiture of marks for misconduct.

Voluntary and unofficial visitation, for moral and reformatory ends, by competent and discreet persons, is not admitted in English prisons of any class. In this respect England has made progress backward in these later years. Even Latimer, in a sermon preached before Edward VI, lifted up his voice for this: "I would ye would resort to prisons," he exclaimed, "a commendable thing in a Christian realm. It is holy-day work to visit the prisoners." In Elizabeth's reign, Bernard Gilpin, not as chaplain, but as a volunteer worker, regularly visited all the jails that fell within the range of his missionary circuits in the northern counties. Very soon after the organization of the Christian Knowledge Society, in 1699, a "committee of prisons" was appointed, who visited, exhorted, and distributed religious books to the prisoners of Newgate, Marshalsea, and other London prisons, and sent packages of their books to all the county jails in the kingdom. The members of the "Godly Club," embracing the Wesleys, Whitefield, and their most zealous followers, visited unofficially, preached, prayed, and distributed books and alms in all the prisons within their circuits, and continued the practice till compelled by the authorities to desist from this part of their labors. At a later day, John Howard, Elizabeth Fry, Sarah Martin, and many other excellent men and women, less known to fame, but no less zealous or worthy, became volunteer visitors in prisons, to the abundant advantage of England and the world; insomuch that England, to-day, may be fitly exhorted, in the words of the Hebrew prophet, to "search for the old paths, and walk therein." I do not think that the clergy ought to be the only teachers of prisoners. Competent persons of both sexes should, under fit restrictions, be admitted, when they are willing, to share his work with them. Especially women—intelligent, discreet, and

sweetly-mannered women—should be encouraged to visit prisons and to bring their magnetic influence to bear on the improvement and reformation of the prisoners.

Another defect in the penitentiary administration of England: the will-power of the prisoners is not adequately developed and invigorated. Fifty years' experience of men, fifty years' work among men, have impressed upon my mind only one idea. It is that nothing can be done with them except through the will. The will can be reached only through the intelligence and the heart. For this, first, religion, in all its freedom, purity, and power, is necessary; and, secondly, in the case of prisoners, progressive classification, whereby the ordinary motives which control men in free society, and urge them to industry and virtue, may act steadily and effectively upon these also, determining to good the choices of their will, and so the actions of their life.

One further point in a way of criticism: I refer to the want of unity in the county and borough jail system. Every jail in England is independent of every other. The little discrimination exercised in the treatment of prisoners struck me as a great defect. There seems only one medicine for all the diseases. Even in the employment of the tread-mill, on which no prisoner can be placed except by express authorization of the medical officer of the prison, and where, therefore, uniformity might be looked for if anywhere, the usages are exceedingly different. In some jails the working hours on this machine are six and a half per day; in others, eight and three-quarters. In some the velocity per minute is thirty-six steps; in others, forty-eight. And the number of feet ascended daily varies from 7,800 to 21,000! In other departments of the administration the differences are no less. Now, I do not object to local government within reasonable limits; on the contrary, I favor it strongly, believing it essential to a living, energetic, effective administration. At the same time I hold, with equal strength of conviction, that the penal system of a country should be a unit; that there should be, in each, some central authority, having, within due bounds, (for in this, as in other departments of the public service, there may be an excess of centralization,) the oversight and control of all institutions, whether of a penal or reformatory character, looking to the prevention and repression of crime. On this condition alone, it seems to me, can there be secured that skillful adaptation to each other of the several parts of the system which is necessary to the harmonious and efficient action of the whole.

I do not propose a description of particular prisons, but will make a passing reference to one or two of them which offer favorable points. The Devenport prison, of which Mr. Edwards is governor, is one of these. It has an average of seventy prisoners. The labor is chiefly industrial. From cocoa-nut fiber, costing £2 sterling per ton, the prisoners manufacture textiles worth £45. The prisoners work in association; there is no separation, except at night. In four years there have been but two recommitments—a pretty strong proof that industrial labor is not inferior to penal labor in deterrent effect. There has not been an infirmity case in the last four years.

The Wakefield prison, West Riding, Yorkshire, is admirably organized and managed by its energetic governor, Captain Armytage. The encircling wall, which is of hewn stone, massive and lofty, incloses eighteen acres of ground, which are almost wholly covered with the numerous buildings belonging to the establishment. The average number of prisoners is about twelve hundred, of whom nearly one-sixth are women. The Wakefield jail is conspicuous among the prisons of Eng-

land for the zeal and success with which industrial labor is carried on in it. In this respect it is quite a counterpart to our American prisons, presenting in every part a scene of busy toil. I believe it is nearly, if not quite, self-sustaining, and I think it has no tread-mill; but my notes are silent on both points, and my recollection is not perfectly clear on either. The prison is built on the separate plan, which is carried out to a certain extent; but the exigencies of the labor system adopted have made great inroads upon that principle. In effect, the prison is conducted much more upon the Auburn than the Philadelphia system. Numerous trades are carried on here, being required to meet the wants of so vast an establishment; but the only industry which brings in a money revenue is the manufacture of mats and matting. Of these the amount produced is enormous. The chief market is the United States, particularly New York and San Francisco, the great carpet-house of the Messrs. Sloane, in the former of these cities, being purchasers to the extent of something like \$25,000 annually. The prison has a cash capital of \$100,000, all derived from the earnings of the prisoners.

§ 2. *Aid to discharged prisoners—the refuges at Wakefield.*—Liberated prisoners in England are helped in their efforts to reform mainly by aid societies; but two of the most interesting establishments in the world, instituted in this view, exist in connection with the Wakefield prison. One of these is a refuge for male prisoners discharged from the establishment, and the other a home, similar in design and character, for the females. The chance here afforded, through these refuges or homes, to every released prisoner, male or female, who desires to reform and eat honest bread, is beyond all praise. In the male refuge, at the time of my visit in 1871, there were accommodations for forty inmates, but they could, at any time, be readily enlarged so as to admit a considerable number more. The inmates are furnished with good board; clean and well-aired dormitories; a bed consisting of iron bedstead, a first-quality hair-mattress, three sheets, two pillow-cases, two dark blankets, one white coverlet, and a box serving at once as a trunk and a seat; a night-school every evening; a preaching service and Sunday-school on the Sabbath; a well-selected miscellaneous library; a reading-room, provided with daily and weekly journals, &c., all at an average rate of 7s. 2d. sterling per capita a week. They work at mat-making, and their average weekly earnings are from eleven to twelve shillings. They do piece-work at rates a little less than those usually paid, because the refuge is not designed to afford permanent employment, but merely to bridge over the chasm between the prison and steady remunerative labor. This chance is given to *every man* released from the Wakefield prison who desires it, and its benefits are fully explained to all during their incarceration, so that not a solitary person, discharged from that prison, can ever come back to it under the pretext that he could get no work to do. Is not that noble? Why may not all large penal establishments organize something of the same kind?

The home for discharged female prisoners is managed upon the same general principles, but the women are not able to earn a full support. The income from their work has to be supplemented by private benefactions. They are accommodated in a new and spacious mansion, built expressly for the purpose, admirably planned, and provided with all needful appointments.

§ 3. *Mrs. Meredith's Wash-house.*—Among the almost innumerable charities of London there is one of a very peculiar character, called the Prison Mission, which is as praiseworthy as it is original. It was devised seven or eight years ago by the lady whose name stands in the

caption of this section, and who is well known in England as one of the most energetic and efficient workers in behalf of discharged female prisoners in that country. The work of the mission is divided into four branches, of which two only will be noticed—and that all too briefly—in this report.

One of these aims is to assist and save prisoners discharged from the London House of Correction for Women. The ladies of the mission have hired two small rooms near the gate of the prison, where some of them are in attendance every morning at the hour when those who have served out their time are discharged, to capture (if that word is admissible in a good sense) as many of the women who have been set free as they can persuade to try a better way of life. They give them a hot cup of tea, with a piece of bread and cheese, read a portion of scripture and offer prayer on their behalf, and explain to them their benevolent intentions and the advantages to be gained from yielding to their persuasions. They succeed in their endeavors with a few of the multitude of wretched outcasts who daily emerge from those prison-walls. But what do they do with and for those whom they have won? They have established an immense laundry, where the clothing and bedding of the poorest and foulest dwellers in the crowded dens of London are washed by these liberated convicts at a cost considerably below what they could do it for themselves. Scores and hundreds of these poor creatures are lifted up and restored to the walks of honest industry through this unique and wonderful agency. The women come at 8 in the morning and leave at 7 in the evening, having an hour's intermission at mid-day. They bring their own dinners, but are provided with a free tea, and receive a shilling a day for their work. Every afternoon, at 4, they are assembled in the chapel, when a chapter is read and prayer offered; and every Sunday evening, at 7 o'clock, a special service is held, to which all are invited; the gospel is preached, and each is afforded, if she will accept, the refreshment of a cup of tea. What a noble charity! It gives work to those whom none are willing to employ. It pays wages to those who are forbidden by many barriers to seek their livelihood elsewhere. It affords them the opportunity, while earning bread, to earn also an honest fame, and to secure ultimately, which nearly all do, better work and higher pay. At the same time, it is a charity which has another aspect, scarcely less important or beneficent, in enabling the lowest class of the London poor to secure clean clothing and bedding at the cheapest possible rate—6d. per dozen pieces.

The other branch of the prison mission-work, to which reference will here be made, is of a preventive character. It aims to save the children of criminals from the paths trodden by their parents. The ladies have established a village of cottages, each cottage containing accommodations for ten children, who are placed under the care of an adoptive mother. This settlement is called "Princess Mary's Village," that lady, now the Duchess of Teck, having taken the work under her especial patronage. At present there are ten cottages clustering around a neat little church and school-house. The intention is to enlarge the village as rapidly as circumstances will permit, until the number of cottages reaches thirty, thus providing for three hundred children.

§ 4. *The Carlisle Memorial Refuge for Women.*—The assistance given to liberated male prisoners in England is almost wholly through aid societies. Not so, however, with female prisoners. Indeed, societies would not, for them, meet the necessities of the case. It is far more difficult for women than for men to obtain situations immediately on their release from prison. Consequently they need to have provided some

place in which their good resolutions may be tested, and some guarantee given for their continued good conduct, before families will be willing to receive them into permanent employment. Hence, those women who so elect, if their prison character has been such as to warrant the indulgence, are allowed to pass the six months immediately preceding the term of their release in refuges established and managed by private effort, but assisted by contributions from the government. Here they enjoy the advantages of a treatment approaching that of home influence, for those establishments are not prisons, either in appearance or discipline—they are *homes*. There are now three refuges for female convicts, the Carlisle Memorial Refuge, at Winchester; the Eagle House Refuge, at Hammersmith, for Roman Catholics, and the Westminster Memorial Refuge, lately established at Streatham. One hundred and seventeen women passed through these refuges in 1871 out of a total of two hundred and seventy-five who were discharged from sentences of penal servitude. The number availing themselves of the advantages they offer has heretofore been limited, for want of accommodation; but the establishment of the last-mentioned refuge at Streatham has prevented the possibility of their suffering this disadvantage again.

Of these, the only one which I visited in the summer of 1871 was the Carlisle Memorial Refuge, at Winchester, at that time under the general direction of Sir Walter Crofton. I was much pleased with the institution, which, from its reports and from what Sir Walter told me, has been very successful in saving from a return to crime the class for whom it is designed. The superintendent, Miss Pumfrey, seemed admirably fitted for her place. Lady Crofton, I found, took an active interest in the refuge, spending three hours there daily in keeping the books and conducting the correspondence. The number of inmates was about sixty, which, I think, is not far from the average. Much pains is taken to keep track of the women after they leave the refuge. Here is a specimen of the record kept of each:

———, discharged August 9, 1867. Same date, went as servant at 14 Queen square, London. February, 1869, left with a good character, and went as housemaid in Grove street, No. 104. January, 1870, went as housemaid in Birmingham. May 16, 1870, doing well in same place. July, 1870, in same place; wages raised; visited by Miss Pumfrey. November 25, 1870, doing well in same place. Same in January, 1871. Same in June and July, 1871, at which latter date she was receiving £18 a year.

The sentiments cherished toward the refuge by those who have enjoyed and appreciated its advantages are well expressed in a letter addressed to Miss Pumfrey by this same person, under date of June 6, 1871. The original now lies before me, and I take from it the following sentences:

DEAR MISS PUMFREY: * * * Will you please write to me soon? I do want to hear how you are, for I can never forget you, dear Miss Pumfrey, never. You did say, please, miss, you would give me one of your portraits. Will you please send me one, if you have one to spare, so that I may place it beside dear Mrs. Bradstock? How is that dear lady* and family? Hope they, with yourself, are well. May the Lord God Almighty ever bless you both for the many hearts you have saved and made happy from trouble. Dear Miss Pumfrey, how are all the women going on? I hope they do not give you much trouble. Please remember me to those that know me, and tell them I am still quite happy, and also tell them that the path of honesty, righteousness, and truth is the path that leads to happiness; and I pray that many, many more souls may be brought to Jesus—yea, that all may be brought to Jesus—as dear Mrs. Barton used to say, “one and all.” “Him that cometh unto me I will in no wise cast out.” Precious words! Onward, homeward, upward, heavenward. Good-bye. God bless you.

From your humble friend,

* Referring to Lady Crofton.

§ 5. *English reformatories.*—These have been, both in their principles and workings, so fully described in preceding parts of this report, that I do not think it necessary to enter into further detail upon the subject. A considerable number of them were visited in different parts of the kingdom, one or two of which I had intended to describe, particularly Miss Carpenter's Red Lodge Girls' Reformatory, at Bristol, a model institution in all respects, especially in its intermediate department; and the girls' reformatory, at Hampstead, London, under the care of Miss Nicoll, which, in neatness, thoroughness, order, and efficiency, moral and material, struck me as one of the best-organized and best-managed institutions of the kind I had ever met with on either side of the Atlantic. But I forbear.

CHAPTER XXXII.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN SWITZERLAND.

§ 1. *The prisons of Switzerland.*—I visited five penitentiaries in Switzerland, viz, at Geneva, Berne, Zurich, Lenzbourg, and Neufchâtel. The tendency of public opinion in this little republic is strongly in the direction of the Crofton prison system in its fundamental principle—that of progressive classification, with gradual withdrawal of restraint and enlargement of privilege, as these are earned by industry, good conduct, and manifest and successful effort on the part of the prisoner toward self-conquest and self-control. However, the first two of the penitentiaries named above—those at Geneva and Berne—are quite an exception to this rule. I shall attempt no description of them further than to say that they appeared to me deficient in most of the essential qualities of good prisons. Each of them may be pronounced a discredit to the city which provides no more suitable plan for the treatment of its criminals, to whatever extent they may have offended against the laws. If, as I hope, the next international prison reform congress shall be held in Switzerland, it will become these two ancient and renowned cities to bestir themselves in the erection and organization of prisons more worthy of themselves and their country, and more in harmony with the progressive spirit of the age in the matter of penitentiary discipline.

On the other hand, the penitentiaries of Zurich, Lenzbourg, and Neufchâtel which I visited, and, as I was informed, those of St. Gall, Bâle-ville, Tessin, and perhaps some others, are in a satisfactory condition. Into all of them, I think, has been introduced, in different degrees and with various modifications, the progressive Crofton penitentiary system.

The penitentiary at Zurich is under the care of Mr. Wegmann as director, who is a most excellent person, with advanced ideas, thoroughly devoted to his work, and intent on improving the mental and moral state of his prisoners. The prison building is an old Dominican convent, of large dimensions, built in the middle ages, massive and strong. It has been altered and accommodated to its present uses. Naturally it is irregular in structure and arrangements; but it is well kept, clean and pure in every part. The average number of inmates falls but little short of 250; at the time of my visit there were 210. It is organized and conducted on the progressive plan. There are three classes. In the lowest class, there were 60 the day I was there; in the second, 128; and in the third, or highest, 12. Prisoners in the lowest class are in cellular confinement night and day; those in the other two are in separation only at night. The minimum of cellular imprisonment is three

months; the maximum, six months. Privileges are increased as they are earned. Ten to fifteen trades are carried on here. Prisoners who were artisans prior to their commitment work, when possible, at the trades which they had previously practised. Prisoners ignorant of a trade when committed are allowed to choose from among those practised in the prison the one they prefer. The prison has a chaplain, who devotes his whole time to the duties of his office. This officer had died the week before my visit, and no successor had been appointed. The late incumbent acted as schoolmaster as well as chaplain; but hereafter this office will be separated from the chaplaincy; and the schoolmaster, like the chaplain, will give his whole strength to his own work, that of secular or scholastic instruction.

The canton of Zurich has a new criminal code, of rare simplicity and excellence, the work, largely, of the distinguished Professor D'Orelli, in whose society and that of a few other cultivated gentlemen I had the honor to pass an evening, greatly to my profit as well as delight.

The penitentiary of Lenzbourg, in the canton of Argovie, has been built within the last few years. It is admirably arranged in all respects, and provided with every convenience and facility for the effective treatment of criminal men and women. Both its construction and organization are due to the zeal and energy of the late president of the confederation, Mr. Welti, a gentleman of marked ability, wisdom, and philanthropy, whom I found at the executive office in the national capitol, and ready to receive visitors at 8 o'clock in the morning, earlier, I think, than any other ruler in the world. The director of the penitentiary is Mr. Victor Hürlin, whose installation had but recently taken place. We were, therefore, shown through the establishment by the sub-director, who has been many years in office, and who impressed me as a man of great intelligence and efficiency. The prison I found, throughout, in excellent condition, and altogether an admirable institution. On the day of my visit, there were two hundred and three prisoners, of whom thirty-three were women. It is managed on the Crofton system, with the inmates divided into three classes. The duration of cellular imprisonment here is quite elastic. It has a maximum, but no minimum limit. The maximum is a year, but within that period the director can transfer a prisoner from the separate to the associated stage whenever he judges it expedient. Unlike Zurich, the number of prisoners in each of the three classes in the Lenzbourg penitentiary was nearly the same. The number of trades practised is twelve to fifteen, and the convict has the choice of which he will learn.

At the penitentiary of Neuchâtel I passed several days as the guest of its director, Dr. Guillaume. I had opportunity to study it thoroughly, and I feel no hesitation in placing it among the model prisons of the world. Dr. Guillaume is a gentleman of great versatility of talent, high culture, boundless enthusiasm, and rare aptitudes for his calling. He has but one idea, one aim; and to that he bends all his strength with a sleepless and tireless devotion: it is to change the bad men committed to his care into good ones; to receive criminals, and return them to society honest men. The average number of prisoners is about eighty, all men. There are three kinds of sentence. Some of the inmates are sentenced to *simple imprisonment*, (these are called correctionals;) some to *réclusion*, (no English equivalent in the sense here used,) and some to *travaux forcés*, (hard labor.)* Those under

* By the introduction of this statement here it is not meant to be implied that these sentences are peculiar to Neuchâtel. The distinction is one in use in most of the countries of continental Europe.

the first-named sentence are misdemeanants; those under the other two, felons. Nevertheless, in prison they all have much the same treatment. The number sentenced correctionally, as compared with those sentenced to *réclusion* and hard labor, is nearly as seven to one; but the number of correctionals actually in prison at any one time is but little more than half of the whole number of inmates. The reason is the comparative shortness of their sentences. These vary from a month to two years, but the average is only four months.

The penitentiary treatment here has for its aim, as already stated, the moral reformation of the prisoner. This treatment is progressive, and the classification is similar in principle to that of the Crofton system. On their entrance the prisoners are placed in the lower or penal class. In this class cellular separation, day and night, is rigidly enforced. The prisoners are placed in cells bare of all ornament and having few articles of furniture, simply such as a due regard to health requires. In this class the prisoner receives only 5 per cent. of his earnings. He is not permitted to wear his beard nor to cultivate plants in his exercise-yard. He can have only such books as are selected for him and can correspond with his friends and receive their visits to but a very limited extent, and only in cases where it is believed that these influences will be decidedly beneficial. The aim is to lead the criminal to turn the mental eye inward and to reflect upon the past, so that he may better weigh the present and take care for the future. This self-introspection is thought indispensable to secure the sincere assent of the prisoner to the treatment of which he is made the object. Isolation and the visits of the officers are found to greatly facilitate the salutary reflections which it is sought to induce in the prisoner's mind. These reflections have also a deterrent effect, for all who have thus gone over their past lives have declared that, if they could at that moment have left the prison, it seemed to them that they would ever afterward have remembered the lesson thus received. Correctionals, sentenced to only a short imprisonment, do not get beyond this penal class, in which the discipline is intended to be of a deterrent character. Those who are sentenced to longer terms pass successively into the middle class and then into the superior.

There is no fixed minimum or maximum for separate imprisonment; its duration is in the discretion of the director. He holds, however, at the end of each month, a conference with the chaplain, school-master, steward, and chief warder, for the purpose of distributing the marks to which each is entitled for the month, for good conduct, for industry, and for attention to lessons: 0 signifies bad; 1, tolerable; 2, good; 3, very good. The maximum of marks attainable in a month, it is thus seen, is 9, as in the Crofton system. These marks, as well as the amount of earnings apportioned to him, are set down in the moral account kept with each prisoner. They are also transcribed into the memorandum-book of the prisoner, who is thus kept constantly informed of the judgment formed by the prison authorities of his conduct. The proportion of earnings accorded to prisoners in the middle class is from 5 to 12 per cent.; in the superior, from 12 to 20. In these two classes they receive a larger percentage of earnings in proportion as the aggregate is greater; nevertheless, the conduct of the prisoner and the degree of attention given to his lessons have their effect in diminishing or increasing the amount. Promotion from one class to another is determined by the prisoner's character, his antecedents, and the length of his sentence.

At the date of my visit—not counting correctionals sentenced to a short imprisonment—there were in the penal class 31; in the middle, 13; in the superior, 14. Among those in the superior class were a

number who had been in the prison ten, twelve, fifteen years, and who would have been free, if the principle of provisional liberation had been introduced into Switzerland. It is believed that this principle will soon have place in the Swiss legislation.

With a view to gaining the will of the prisoner to the system of discipline to which he is to be subjected, this system is explained to him as soon as he enters the penitentiary. His antecedents are made the object of a careful but kindly examination. He is aided by suitable suggestions in his endeavor to search into the causes which led him into crime. Each case becomes the subject of a serious inquest, and confidential information is sought from respectable persons by means of some such letter as this :

SIR: ———, of ———, aged ———, has just been committed to the penitentiary of Neuchâtel, to undergo there an imprisonment of ——— years. For the purpose of being able to direct his penitentiary education with some chances of success, we desire to obtain exact information concerning his family and the associations in which he has lived; concerning his education, his religious and scholastic knowledge, his apprenticeship, his occupation, his means of living, his character and moral habits; in a word, concerning all the points which might guide us in our task and enlighten us as to the causes which have conducted him into the pathway of crime. Knowing the interest you take in the unfortunate, we venture to send you the accompanying formula, which we ask you to return to us after having answered, confidentially, the questions contained in it. Thanking you in advance, we are, &c.,

[Signed by the director and chaplain of the penitentiary.]

* A formula is inclosed in this letter headed, "Confidential informations." Each page is ruled in two columns—the left containing printed questions, the right being blank to receive the answers. I print them solid, to economize space, and in a note, to avoid breaking the continuity of the text: 1. Name and surname of the prisoner? 2. Date of birth? 3. Place of nativity? 4. Legitimate or illegitimate? 5. An orphan? By loss of both parents? Of father? Of mother? 6. Since what age? 7. What was his education up to the time of entering the primary school? 8. Did he live at home? 9. Or was he placed at board? With whom and where? By whom? 10. How many years did he attend school? 11. In what place? 12. Was he studious? Did he show a taste for study or was he idle, indifferent, &c.? 13. At what age did he quit school? 14. What degree of learning had he when he ceased going to school? 15. Has he attended night-schools? 16. At what age did he pursue the course of religious instruction and ratify the vow of his baptism? 17. Have you noticed anything special in the character of this catechumen? 18. Has he undergone an apprenticeship? 19. What and with whom? 20. Did his master set him a good example? 21. What was the duration of his apprenticeship? 22. What company has he frequented? 23. After his first communion was he seen in the *cafés* making himself merry with wine? 24. Was he fond of gaming? 25. Has he traveled? In what countries? For how many years? 26. Has he served in foreign armies? 27. What was then his reputation? Was he a debauchee? 28. Are his parents still living? 29. What were their means of living? 30. Have they been convicted of crime? 31. Did his grandparents live in the family? 32. How many brothers has he? How many sisters? 33. By a first marriage? A second? A third? 34. How old are they? 35. What are their means of living? 36. Have any of them been in prison? 37. Have they a guardian? Does he do his duty by them? 38. Do you know of the existence of mental or physical maladies (insanity, epilepsy, &c.) in his family? 39. Is he married? 40. At what age did he marry? 41. Did he have the means of supporting a family? 42. What is the moral character of his wife? 43. Have they children? 44. How many? 45. Has their education been neglected? 46. Has it been a happy marriage? If not, to whom and to what do you trace the cause? 47. Have their children already been brought before the courts? 48. Was the prisoner orderly in his habits? 49. Was he industrious? 50. How much did he earn a day? 51. Is he a drunkard? A gambler? A debauchee? 52. Has he illegitimate children? 53. To what cause do you ascribe his misconduct and the crime he has committed? 54. Has he had troubles? Has death sundered the ties of family? Has he experienced reverses? 55. Has he relatives? Uncles? Aunts? What are their moral character and their social position? 56. Has the commune aided him, his relatives, or his family? 57. Who takes care of his family, now that he is in prison? 58. Might the prisoner, on his liberation, return to his previous abode, or would it be better that he change his associations?

Even in this small prison, with an average of only eighty inmates, from fifteen to twenty different industries are carried on, including shoemaking, tailoring, carpentry, smithery, coopering, turning, lithography, watch-making, book-binding, basket-making, brush-making, gardening, &c. Every prisoner, not already master of a trade on his entrance, is allowed free choice of any of those pursued in the prison. The foremen work with the prisoners precisely as a boss mechanic works with his apprentices. There are never more than four workmen in a shop, but others are often working at the same trade in cells, who are instructed and supervised by the same foreman. While he is attending to them, the prisoners in the common shop are left alone, but they are as diligent in his absence as when he is present. In a great work-shop, where the keeper is always on an elevated platform, with no other occupation than that of overseeing a number of men working in silence, it is impossible for him to give the good example of industrious labor himself. Such a system is believed by Dr. Guillaume to be as pernicious for the prison employé as it is for the prisoners. For this reason he gives the preference to the system which approaches nearest to that of the free work-shop, and it is on this account also that *the law of silence does not exist* in the penitentiary of Neuchâtel. The same usage is found in the penitentiary of Bâleville, the rule of silence not being enforced there. This relaxation is upon the ground (the director of that prison says) that the liberty of talking openly, within fitting—that is to say, moderate—limits, makes the prisoners more frank and sincere, since it frees them from the necessity of resorting to devices for the purpose of communicating with each other. In the other Swiss penitentiary establishments the rule of silence exists. But Dr. Guillaume insists, and, indeed, it is well known to all conversant with the subject, that prisoners find a certain charm in breaking this rule, and that they succeed in doing so only too often. It is for that reason that he does not attempt its enforcement in his establishment. He holds that it is artificial, that it is consequently irrational, and further that it is little adapted to the training process to which prisoners, if they are to be reformed, must be subjected after the penal stage. In his own prison, where the foreman (who is a prison officer) works with the convict laborers, and every one is busy, there is very little conversation, and what is said relates to the work. At the ten-minute recesses, at 10 and 4 o'clock, conversation, directed and maintained within the limits of propriety and self-respect by the foreman, is found, instead of being hurtful, to have an excellent effect. For the most part it turns upon the subject of the last school-lesson, the mathematical problem given out to be solved, or the conference of Sunday, at which the employés, as well as the prisoners, are required to be present. The presence of the foreman is considered by Dr. Guillaume necessary, in order that, through his moral ascendancy, the conversation may not degenerate into grossness and obscenity. So far, on a three years' trial, the authorities have only had occasion to congratulate themselves on the results of this system, which seems to be in accordance with the inward and essential nature of man.

Labor in association is restricted to the prisoners in the middle and superior classes, and is accorded to *them* only when the accommodations and the kind of industry permit. Many remain in their cells even after having been promoted to the higher classes. The lack of suitable accommodations prevents their introduction into the workshop, and deprives of its greater freedom and privilege many who have shown themselves worthy of such indulgence. Such relative liberty Dr. Guillaume

considers a necessity in this stage of penitentiary discipline. This inconvenience would disappear if there were three prison buildings—one for each class—in which the arrangements were adapted to the end in view, and to the necessities of each of these successive stages. The prisoners in passing from one establishment to another would *see* the progress made toward their liberation. Under the same roof it is difficult to establish and to make sensible the distinction between the two higher penitentiary classes. For this reason Dr. Guillaume is a partisan of the Crofton system in its strictness.

As regards discipline, no corporal punishments are allowed. The punishment-cell and a diet of bread and water are authorized by law, but they are now never employed. Deprivation of work in an ordinary but empty cell is the severest disciplinary punishment at present in use. *Ennui* is found an effective means for conquering the most obstinate, especially if they have been treated with kindness and justice. The punishment-cell, it has been found, often makes martyrs, and it is not well to make martyrs in a penitentiary any more than in politics and religion. For an officer to lose his temper and speak with anger to a prisoner who has been guilty of a breach of discipline, is to approach the lower moral level of the prisoner himself, and to give him reason to believe that he has not deserved so rigorous a treatment. For this reason Dr. Guillaume makes it a rule to treat prisoners as the insane are treated, whose ill-conduct never provokes the wrath of the physician, but rather his compassion. He makes them feel, by words calm and self-restrained, that he is pained to perceive that they do not know how to govern themselves, and that they have not yet attained that self-control, that mastery of their thoughts and acts, that dignity, in a word, which belong to men who respect themselves. This mode of treatment, employed with tact and a skillful adaptation to each prisoner's special character, has shown itself effectual. It requires more *patience*, greater *effort*, and a longer *time*, than the expeditious punishments of the lash, the douche bath, the dungeon, and other similar inflictions; but the most recalcitrant yield to it in the end; and—a material consideration—without any waste of the prisoner's inward moral forces, but rather a toning up and strengthening of his entire moral being.

With a view of having a number of moral punishments, there have been introduced into the penitentiary of Neuchâtel a number of moral rewards and encouragements. The withdrawal of these latter constitutes a punishment far more sensibly felt, and therefore far more efficacious, than the rigors of the old *régime*. It would be difficult, if not impossible, to enumerate all the rewards held out to win back the prisoners to virtue's paths, for they are often suggested by special tastes and desires, which take on an endless diversity of forms. Some of them, however, may be named, which will serve to give an idea of their variety. They are: 1. Promotion, speedy if deserved, from class to class. 2. The privilege of apprenticeship to an interesting trade, such as lithography, book-binding, or any other that may be preferred. 3. Increase of the proportion of earnings. 4. Permission to use a part of these in the purchase of books, popular illustrated journals, scientific and literary, engravings to adorn their cells, and tools wherewith to occupy themselves in their own time. 5. Permission to wear a watch, or have a thermometer. 6. Permission to wear their beard. 7. Permission to cultivate flowers and vegetables in the little garden of their exercise-yards, and, by consequence, to have flowers in their cells, and oil and vinegar for salad. 8. Permission to receive the visits of their relatives in the office of the director, and not in the prisoners' conversation-room.

9. More frequent leave to write letters to their friends. 10. Permission to purchase articles of clothing, for example, cravats, to wear on Sunday. (Under this head Dr. Guillaume expressed a hope that the time might come when the superior class should have, on Sunday, a special suit of clothes, including leather shoes—clogs only being now permitted by the rules—thereby contributing not only to their comfort, but to their self-respect and personal dignity.) 11. Permission to learn to play on the *zithare*, a small musical instrument, of thirty cords, making so little noise that it is scarcely heard in the adjoining cells. 12. The privilege of choosing books for themselves out of the prison library. 13. To draw, (especially to make mathematical drawings.) 14. To read the technical journals taken by the administration. 15. Admission to positions of trust; for instance, in the distribution of meals, in the bureau, and in other services of the house, as temporary aids. 16. Permission to superintend the apprenticeship of fellow-prisoners in the middle class.

Long and noble as this catalogue is, a grave omission is observable in it.

Abbreviation of the term of imprisonment is not among the incentives held out to the prisoners of the Neufchâtel penitentiary to quicken their endeavors toward a better life. Yet nothing is so sweet to the human mind, nothing is so much coveted by it, as liberty; and nothing, therefore, presents so powerful a motive to exertion as the hope of shortening the period of captivity, if only for a few days; how much more when the term is months, or even years. Dr. Guillaume is quite sensible of this, and hopes, as all must, that Switzerland will not have to wait long for this great step in prison reform.

Among the encouragements there is also one (not set down in the above enumeration) which I cannot approve, and which will not be approved by my countrymen; but it is in accordance with European (continental) sentiment and usage. It is permission to occupy Sunday afternoon in small industries on their own account, such as embroidery, (*broderie*,) the coloring of engravings, the manufacture of little wooden baskets, &c. This is contrary to American and English ideas of the sanctity of the Sabbath; and we think we draw our ideas from the word of God, which we regard as the ultimate standard of faith and morals.

The withholding of the rewards and favors accorded to prisoners are the punishments employed when the private exhortations of the director produce no result. Admonition, kindly exhortation, the appeal to honor and manhood, are the first punishments, if that is not in this case a misnomer, and they are sufficient in a great number of cases. If there is a repetition of transgression, the withdrawal of a reward follows, and that is chosen whose loss will be most sensibly felt by the prisoner. Here individualization, as a matter of course, comes in. If the prisoner shows himself submissive, if he feels that he is justly punished, and if he conducts himself in an exemplary manner for some time, the punishment ceases, and he again enters into the possession of the forfeited privilege.

Permission to wear the beard is a privilege greatly prized. Hence, the punishment which consists in a removal of this token of manhood is proportionally dreaded. The simple threat to cause a prisoner to be shaved for an offense is, in many cases, enough to prevent a repetition of it. Others are less sensitive on this point. It is necessary to individualize, and not—such is the opinion of Dr. Guillaume—*humiliate*, the prisoner. The punishment should in no case wound his self-respect, which he never wholly loses, though at times it sinks to a very low plane. This sentiment rises in the prisoner in proportion to the esteem which is

shown him; and it is, above all, when called upon to punish him, that we should never forget that he is a man, our brother. In making him feel this, he will comprehend his own responsibility, and a feeling of shame will be awakened in his breast. This sentiment is feeble at first, but it grows and strengthens in proportion as the work of reformation advances. It is this vital fact which explains why, in the penitentiary of Neuchâtel, there is neither corporal punishment, nor chains, nor prison garb, nor *gens d'arms*, nor armed or even uniformed officials. The constant endeavor is to place the prisoners in conditions similar to those which are found in respectable mechanics' families, where labor, order, economy, and intellectual recreations are held in esteem.

An effective school is maintained in the prison, on one of whose sessions it was my pleasure to attend. It is divided into three classes, and, so far, is upon the model of the ordinary primary schools of the country. The average attendance for the year has been, in the lowest class, ten; in the middle, thirteen; in the highest, fifteen. All the other prisoners receive lessons in their cells. A schoolmaster devotes his whole time to the work of instruction. Admission to the school is made a recompense of good conduct, and is found to be a strong stimulus to such conduct. To all such, admission is an occasion of rejoicing and a source of satisfaction. A withdrawal of its privileges, for ever so short a time, is felt as a punishment. On entering the school, a written examination takes place, and this is repeated at the end of each month. The pupils are classified by its results. The order of the examination is as follows: 1. Date. 2. Name of prisoner. 3. An exercise in reading. 4. Solution of a problem in arithmetic. 5. Geography, questions and answers. 6. History, same. 7. Composition, on a subject assigned or freely selected. 8. Dictation of several sentences.

The branches taught are reading, writing, arithmetic, geography, history, and the natural sciences. Each lesson begins with the reading of a piece selected from a school-book used in the public schools of the country. The piece to be read is announced at a previous school session, so that the pupils may prepare themselves to ask the schoolmaster questions on the subject to which it relates. He solves their difficulties, and adds such comments as he deems fit. He then gives oral lessons in geography, history, &c.—lessons which have been suggested by the piece read, or the questions asked. The endeavor is always, as much as possible, to give the practical side of things, so as the better to awaken the interest of the learners. The problems given in arithmetic and geometry are invariably such as admit of an immediate application.

As soon as they have arrived at the point where they are able to do so, the pupils are expected to keep a journal, in which, among other records, they give a summary of the lesson of each day, and some of these abridged statements are read at every school session. I was greatly interested in the compositions of this kind which were read on the day of my visit, all of which were on the subject of glass, giving an account of its elements, manufacture, uses, history, &c., &c. They gave token both of the thorough manner in which the teacher had imparted his instructions, and of the close attention with which they had been listened to by his convict scholars.

On every Sunday morning, the hour immediately preceding divine service is devoted to a lecture by the director on whatever subject he may choose to address his audience, which is composed of all the employés and prisoners of the establishment. His range of topics is wide, including biographies of celebrated men sprung from the ranks of the people, (Benjamin Franklin, John Bright,) philanthropists, (John How-

ard, Florence Nightingale,) striking events of the day, (the arbitration at Geneva,) new inventions and discoveries, (the electric telegraph, the microscope, the mowing-machine,) questions of a literary or scientific character, geography, history, astronomy; everything, in short, which constitutes a human interest or contributes to human progress. Before the lecture commences, Dr. Guillaume is accustomed, for a few moments, to pass in review the general conduct of the prisoners, and to give them his thoughts on lying, on idleness, on want of cleanliness, on indifference, on levity of character, on impoliteness, on thoughtlessness, on inattention to order, or some other of the numerous points embraced under the general designation of minor morals. In the afternoon of Sunday the prisoners are required to write compositions, either on the subject of the morning's lecture or on some other topic given out in class. As further subjects of composition, there are distributed copies of some engraving—"Our Father which art in Heaven," or some other; and they may then exercise themselves in a description of the engraving, and in expressing their sentiments on what it represents. These compositions are compared, their relative merits weighed, and the best of them selected for insertion in a little autographic journal, of which some account must now be given. This is a paper under the title of *Travaux d'Ecole*, (*School-Work*), edited and published in the penitentiary every fortnight. Each number occupies four pages of square letter-paper, (large size,) and is illustrated by one or several pictures, the whole lithographed by the prisoners. It contains compositions, puzzles, arithmetical problems and their solutions, &c., mostly by the convicts, moral and instructive sentences, selected from eminent authors, and a variety of other matters. One needs but to glance at a few numbers of this unique journal to satisfy himself that the educative and reformatory power embodied in it must be great indeed.

As a still further encouragement to diligence in learning, there are distributed at the end of every month, after the customary examination, engravings, books, crayons, &c., to those who have distinguished themselves.

Each class has an hour in school daily, and those who are in cellular confinement receive also the daily visit of the teacher. This is especially the case with the new-comers and the abecedarians. These last are not admitted into class till they are able to follow readily the reading which takes place there.

The penitentiary has a library of nearly 500 volumes. The school-master has charge of it and superintends the exchange of books. But it is his duty not to permit an exchange till he has satisfied himself that the applicant has really read the book he is returning, and has profited by it. The prisoner who wishes to be sure of receiving a new book writes in his journal a *résumé* of his reading, and copies the passages which have most interested him by their sentiments or their style. In this manner the more zealous come at length to find themselves in possession of a collection of maxims, sentences, pithy sayings, proverbs, and the like, drawn from the authors whom they have read.

In the visits which Dr. Guillaume is accustomed frequently to make to the school-room, he takes occasion to ask one and another what book he is reading at the time, and he requires the prisoner so interrogated to give him some account of it. This suggests reflections on the manner of reading books so as to derive the greatest advantage from them; and the observations addressed to one become profitable to all.

The journal is not, strictly speaking, obligatory; but all know that to have one is to conform to the director's desire. It is simply a copy-book,

in which the prisoner sets down each day what he has done, and the reflections suggested by his reading, his lessons, &c.; also his observations on the weather and the periodic phenomena of the plants in his garden, on the trees of the neighboring forest, the birds which he hears sing, the visits made to him, the letters received or sent, the sermon of Sunday, the visitors seen in the chapel, &c., &c.

The schoolmaster is required to submit to the director a monthly report of the condition of the school and the progress of the scholars. One of these, in manuscript, was placed in my hands, and now lies before me. It is a curious and instructive record. Eleven prisoners had been admitted to the school during the month. The result of their initial examination showed that one only had a *tolerable* primary education; the other ten, *bad*, reading and writing with difficulty. Nine had left the school, their term of sentence having expired. Of these, the primary education of two was *good*; of two, *tolerable*; of five, *bad*. The two noted as good had been four months in attendance; the others were short-term prisoners, *correctionals*. The distribution of the school into classes was: In the inferior, 18; in the middle, 18; in the superior, 11; total, 47. The number of weekly lessons given to each class was 6; total, 18. The course of study for the month had included, in geography, the principal mountains, valleys, rivers, and lakes of Switzerland, its different cantons and capitals, the products of its soil and industry; in Swiss history, the leading events of the fourteenth and sixteenth centuries; in inventions, the telegraph; in arithmetic, numerous practical problems, with the bearing of each, and exercises in class. The master further reports that he has examined the summaries made by the prisoners of the contents of the books read by them during each week, and that the result of the usual monthly examination had been, upon the whole, satisfactory. The subjects of the pieces read in class, and of the compositions written on them, are reported as glass, porcelain, clothing, mountain birds, the cork-tree, consumption of alcoholic drinks in England and the canton of Berne, statistics of intemperance and considerations upon it; petroleum, and the quantity exported from America; different systems of lighting, &c., &c. Thirty hours are reported as having been devoted to giving lessons in the cells. He puts down as the subjects of Dr. Guillaume's Sunday lectures for the month: August 4, An account of his voyage from Neuchâtel to England in a geographical point of view, means of communication by railway and steamer; August 11, Interesting fragments from Macaulay's History; August 18, Miss Mary Carpenter and her labors; August 25, Climates, with a picture showing the plants and animals of the different zones. The report embraces other points which I omit, and closes with a hearty tribute to the diligence, zeal, interest, and good conduct of his convict pupils.

I was anxious to ascertain whether the public opinion of the prison could be so developed and directed that it might be made to react effectively upon the prisoners as one of the governing forces of the establishment. On this point I interrogated Dr. Guillaume closely, and his account of the matter was substantially as follows: He conceives that such as are the employés, such will be the prisoners; that if the former comprehend their mission, possess the necessary tact, and make themselves respected by their conduct and their conscientious industry, (for they are required to work no less than the prisoners,) the latter will imitate them in well-doing, and all will contribute and unite their influence in maintaining the order and discipline of the establishment. Consequently, his first care is directed to the officers. To develop their inter-

est in the work, he holds frequent reunions of the foremen and other employés, and gives them familiar lectures, or, as he styles them, *conferences*, on the history of penitentiary reform, on the various systems employed to effect the reformation of criminals, and on the duties of persons charged with so high and responsible a function. These conferences have for object the familiarizing of the employés with the service, and especially with the spirit which has dictated its rules and regulations. In making apparent to their apprehension how great and noble is the mission of laboring for the reformation and future well-being of their fallen brethren, the employés, if they have the necessary aptitudes, begin to comprehend how important is the part which they are called to play, and by degrees they come to realize the dignity of being responsible agents, and to feel a pride in their work. They no longer look upon themselves as mere turnkeys and jailers, but rather as guides, teachers, trainers, who must, above all, preach by their example. They have, severally, at heart the good order and discipline of their ward—that is, of the prisoners who are placed under their special care. Emulation develops itself among them, and they seek to rival each other in zeal for order, decorum, good manners, politeness, industry, &c. Each one is anxious to have the cleanest and most orderly ward, and the best arranged, best kept, most industrious, and most successful workshop.

As regards the penitentiary public, this *esprit de corps* makes itself equally felt, insomuch that it produces in all the employés a desire to maintain the good repute of the establishment. The penitentiary is for them their family.

At the last industrial exhibition in the canton the penitentiary coopers obtained a medal, and the gardeners a prize, since which time there has been established a traditional reputation, which will doubtless be maintained, for the prisoners have become imitators of the keepers in their *esprit de corps*. On the occasion of the exhibition, the prisoners were anxious to prove to the public that they knew how to work, and that in due time they would be worthy to re-enter society. The press, on this occasion, indulged in a variety of criticisms, but the public showed itself favorable to the introduction of industrial occupations into the prison, and the admission of the products of prison labor to this general exposition of agricultural and mechanical industry.

Owing to the sagacious and comprehensive combinations of Dr. Guillaume, as explained above, the public opinion of the prisoners is such that it exercises a strong power of control over them. Often, by their remonstrances and their influence, they repress the evil thoughts which occasionally show themselves in one or another of their comrades. Among the motives impelling them to act in so praiseworthy a manner is the fear of forfeiting or lessening the fair reputation which may have been won by their shop. Dr. Guillaume explained, and seemed very desirous that I should comprehend, that, in speaking of evil purposes formed by individual prisoners and suppressed by the force of public opinion, he alluded to trivial offenses—mere breaches of discipline—for they never had had cases of gross insubordination, revolt, and the like—cases which, indeed, they had come to regard as of almost impossible occurrence.

Various books of record, in addition to accounts-current, are kept by the authorities, in which are noted different classes of facts relating to the prisoners. I propose to make but brief reference to only a portion of them. One contains the most complete statement attainable, whether from the prisoner himself or from trustworthy persons in the locality from which he came, of his antecedents, character, habits, occupation, relations, value of the property stolen, if his crime was theft, &c., &c.

Another opens a moral account with him, in which a continuous record is kept, month by month, of his conduct, industry, and habits of study, according to the following form :

Names.	Month of ———.				
	Conduct.	Industry.	School.	Total of marks.	Earnings.
A	3	3	3	9	3f. 60c.
B	2	2	2	6	2f. 80c.

A column is added for general remarks. The marks are settled, as already explained, in the general conference of officers at the end of each month.

In addition to this there is for every prisoner a file or bundle of papers, (*dossier*,) in which are found : 1. The charge, sentence, &c., of the court. 2. Official and confidential information obtained relative to the prisoner's antecedents. 3. A short account of his life, written by himself or at his dictation. 4. The result of his scholastic examination on entrance. 5. A monthly transcript from the moral-account book and the punishment record. 6. His photographic likeness when committed. 7. Good or bad facts relating to his conduct. 8. His photograph on leaving the prison. 9. Facts relating to the aid given him at his discharge, (*son patronage*,) and his conduct after liberation.

The *cantine** does not exist in the penitentiary of Neuchâtel, nor is it in contemplation to introduce it. It is believed there that such an institution must end in demoralizing both officers and prisoners, and that therefore the fixed dietary of the prison ought to be made sufficient to satisfy all fit and reasonable wants.

During the few days I passed at Neuchâtel I mingled freely with the prisoners, conversing with them *ad libitum* without the presence of an officer. I found the best spirit and the best state of feeling existing among them. Of not a few the love to Dr. Guillaume seemed like that of children to a father. I verily believe that there are prisoners in that penitentiary whom this feeling would hold there as with chains of steel, if every bolt were removed, and every door set wide open, thus proving again the truth of Dr. Wichern's paradox, that "the strongest wall is no wall."

It will be asked, What about the earnings in a prison which seems so much like a university, and where every thought, contrivance, and effort appear to be given to the reformation of the convicts ? I am happy to reply that they are nearly enough to meet all the current expenses of the establishment, and, in all probability, will reach that point in time. They are greater to-day, man for man, than in any other penitentiary establishment in Switzerland.

Another and still more important question is : What reformatory results are shown ? To this question I make answer : The experiment is yet in its early infancy. At the time of my visit, scarcely two years had elapsed since the accession of Dr. Guillaume. In the most remark-

*This is found in all French and perhaps most other continental prisons. It may be described, in the most general terms, as a privilege of purchasing additional comforts, not included in the legal rations, with the prisoner's *disposable peculium*—that is, such part of his earnings as he may spend while still in prison.

able and most successful experiment in prison discipline that perhaps the world has ever seen—that of Colonel Montesinos in Spain—which finally brought down the recommittals from 40 per cent. to zero, no visible results, as far as statistics are concerned, were shown till after the completion of the third year. As regards Dr. Guillaume's experiment, if he does not in the end bring down the percentages of relapses gloriously, reformatory prison discipline must be a delusion; those who seek to inaugurate it are chasing a bubble; and the best thing society can do will be to hang, shoot, or decapitate every man whom it can catch and prove to have committed a crime.

§ 2. *Reformatories in Switzerland.*—Most of the Swiss cantons seem well provided with juvenile reformatory institutions, of which, however, the time at my command permitted me to see but one, and of that to take but a cursory glance. It is an agricultural colony or reform school, two miles from Berne, conducted on the family plan, with twelve boys in each household, under a house-father. The establishment appeared to me well kept in every respect, and the appearance and tone of the inmates excellent. Results good, few of the boys returning to crime.

CHAPTER XXXIII.

PERSONAL INSPECTION OF PRISONS IN GERMANY.

§ 1. *German convict-prisons.*—Of these my limited time and the pressure of duties belonging to the leading department of my mission allowed of an inspection of but three—the Moabeit prison, at Berlin, Prussia; the prison of Brüchsal, Baden; and the prison at Munich, Bavaria, formerly under the care of the celebrated Obermaier—all of them among the most renowned of the penal establishments of the empire.

(a) *The convict-prison at Berlin.*—My distinguished friend Baron von Holtzendorff and the illustrious Dr. Wichern being both absent from Berlin at the time of my visit, I was compelled to make my inspection of this prison alone. The Moabeit is a prison constructed on the panoptic or radiating cellular plan, with four wings and five hundred and eight cells, besides underground workshops sufficient for one hundred and fifty men, and a farm, at some distance from the prison, to give employment to those prisoners who, on account of bad health, age, or length of sentence, cannot serve out their entire term in separation. The prison is managed by a Protestant brotherhood, called the Brethren of the Rauhe Haus, and trained, therefore, by Dr. Wichern for the work of the Inner Mission. The average of relapses is about 13 per cent. Though having no permit from an official source, I was received with much courtesy by the director, a gentleman of great benevolence of character, but unfortunately knowing nothing of English, French, Spanish, or Italian, a catalogue which exhausted my own powers of speech. He began by showing me a complete set of drawings which exhibited the prison in all its parts, and, being in a universal language, were readily comprehended. He then conducted me through the establishment, entering at least fifteen to twenty cells, where I had an opportunity of seeing the prisoners at their different occupations. These were quite various, and embraced lithographing, engraving, carving in wood, &c. The manner of his intercourse with the prisoners pleased me exceedingly, marked as it was by a gentle and kindly spirit, with

nothing of official stiffness. The visit was in all cases commenced by a friendly greeting, and on leaving the director bade each one adieu, with sometimes an added hand-shake. As we passed along he explained everything in *German*, just as if I had understood a word of it! The prison I found kept in the neatest manner; the prisoners had a cheerful look; every cell (for we peeped into many which we did not enter) seemed a little home of solitary industry; material wants were well provided for; and the director was evidently a favorite with the inmates. Beyond this I cannot go. It was the shell only that I saw. Visiting prisons with no power of intercommunication is but a sorry and certainly a most unsatisfactory business.

(b.) *The convict-prison at Bruchsal.*—This is the model cellular penitentiary of Germany, and the oldest, having been opened in 1848. Like the Moabit, at Berlin, it is on the radiating plan with four wings. The number of cells is four hundred and eight. A model prison itself, it has a model director in Herr Ekert, whose administration combines, in admirable proportions, justice with mercy, firmness with humanity, and breadth of scope with a minute attention to details.

Most of the German states have three, many of them four, different kinds of public punishment. Punishment of the highest degree, awarded of course to the highest crimes, is condemnation to the *zuchthaus*, (house of correction.) Prisoners so sentenced lose their civil rights. The maximum sentence is for life; the minimum, two years. The second degree is termed *arbeitshaus*, (work-house.) Condemnation to this punishment varies from a few months to several years, but it does not extinguish municipal rights. As its name implies, it involves compulsory labor the same as the *zuchthaus*. The third degree is called *gefängness*, (jail.) This sentence does not make labor obligatory, but allows "occupation in accordance with the social position and ability of the prisoner." A fourth kind of punishment—it can hardly be named a *degree*—is termed *festung*, (imprisonment in a fortress.) It is a punishment awarded to gentlemen offenders; mostly in cases of political crime or dueling.

But I seem to hear the inquiry, What has all this to do with the penitentiary of Bruchsal? Not much, perhaps, but at least this: Formerly the establishment at Bruchsal united in itself two prisons, the *zuchthaus* and the *arbeitshaus*. The prisoners of each class were in nearly equal numbers, and, though nominally under different rules, were both subjected to the same system of absolute isolation. But the system of mixing the two classes has been abolished. None but the higher criminals are received at present, so that the penitentiary has become strictly a convict-prison. Although the system is intended to be rigorously cellular, there is a department of the prison, called the "auxiliary establishment," where association is permitted to the following classes of prisoners: 1. Those who have been in cellular separation six years, unless they elect to remain in isolation. 2. Old men who have passed the age of seventy. 3. Prisoners adjudged not fit for cellular separation on account of the state of their health, bodily or mental. There were some twenty or thirty persons in the auxiliary establishment when I was at Bruchsal, out of a total of 384. In point of fact, not more than an average of nine per cent. are detained for periods exceeding four years. Though a zealous supporter of the separate system, Mr. Ekert states, in one of his reports, that after three years of cellular confinement the muscular fiber becomes remarkably weakened, and that, after that, to require hard work would be tantamount to requiring an impossibility.

Mr. Ekert conducted me through every part of his admirably arranged and admirably managed establishment, and explained the multiplied details of its organization and working. I cannot stay to repeat his statements at any length. The different occupations of the prisoners run up to eighteen or twenty. Every prisoner learns a trade, who was not master of one before his committal. To some extent the prisoner's own preference is consulted, but the great study is to give him a trade that will enable him to earn an honest living after his discharge. It may be stated here that while only three or four per cent. of the convicts are wholly illiterate when received, more than half had not learned a trade. They are encouraged and incited to diligence by being allowed to share in the product of their toil. Two chaplains are employed, one for the Catholic, the other for the Protestant prisoners, who severally hold service twice on Sunday and once on Wednesday, besides doing abundant pastoral work in the cells. Two schoolmasters also devote their whole time to the work of scholastic instruction in the cells. An annual examination of the prison pupils takes place, (the interval is certainly too long,) at which premiums are distributed to the deserving, consisting of books, copies for drawing, tools, &c., &c. Upon the whole, the training, schooling, industrial employment, and religious care of the convicts appeared to me to be in a satisfactory condition.

The superior officers meet every day in the office of the director for conference, when they make report of their respective observations for the last twenty-four hours, and take counsel together for the future.

(c.) *The convict-prison at Munich.*—This penitentiary, placed a little outside of the city, was the scene of Councilor Obermaier's labors, who, however, long since—more than twenty years, I think—retired from it; but he still lives, a vigorous and honored octogenarian. I called at his residence in Munich, with the great infelicity of finding that he had gone to spend a month in the Bavarian Alps; and so I missed seeing the man whom, of all others living, I should most desire to converse with, since Maconochie and Montesinos have both been called to their reward.

Mr. Petersen, who was a delegate from the Bavarian government to the congress, accompanied me to the prison. We found (which was another disappointment) that Mr. Mess, also a Bavarian government delegate to the congress, who is the present director, had departed on leave only the day before. We were, however, courteously received by the sub-director and chaplain, the former of whom conducted us through the establishment, giving all needful explanations.

The prison was originally a monastery, and has been adapted to its present use. It is of great extent, but extremely irregular. Every part was found to be clean, sweet, and in good order. There are fifty-seven cells for separate imprisonment, all but two having occupants the day I was there. Beyond that the establishment is on the congregate plan. The entire capacity is for five hundred and fifty; there were four hundred and ninety-nine at the time of my visit. It is a convict-prison, (*maison de force*), and none are admitted but those sentenced to hard labor, (*travaux forcés*.) In Obermaier's time, and since, sentences were from five years to life. Now the shortest are for one year. There were fifty-two life-prisoners. Most of those who have this sentence die in prison; few ever receive a pardon.

Contraband traffic, especially in tobacco, is the offense oftenest committed. The punishments are reprimands, diminution of rations, privation of peculium, confinement in a cell, the dungeon, and, in bad cases, irons. Corporal punishment has been abolished since 1861. It

is gratifying to know that since its abolishment the number of offenses has greatly diminished. Prior to its prohibition the prisoners—so it was reported to me—were in a constant state of irritation, and open revolt was not infrequent. Since then nothing of the kind has occurred. The prisoners are tranquil and docile. School is held daily for two hours. There are six classes, and each class receives two hours' schooling per week. Better would it be to double the dose. The branches taught are those common in primary schools, with a little chemistry and natural science superadded. The progress made is fair.

As in Baden, the prisoners nearly all know how to read when committed; but the greater part have not learned a trade. The industries pursued in the prison are many, including lithography, book-binding, shoemaking, spinning, weaving, painting, carpentry, &c., besides domestic labors and other work for the establishment, in which thirty-eight prisoners find employment. The net earnings in 1871 amounted to \$11,977, which was considerably more than sufficient to meet a fourth of the expenses.

The prisoners sleep as well as work in association. Obermaier had a strange liking for this system, and no doubt his extraordinary genius for controlling bad men and molding them to his will enabled him to overcome many of the evils inseparable from it. It is, however, inherently and ineradicably vicious, and is now condemned by the common judgment of the world.

The prisoners take their dinner at 11 a. m., after which they are permitted to amuse themselves in the large courts or yards of the prison till 1 p. m. They are supervised by keepers during this hour and a half, but otherwise are quite unrestrained. Passing through the different courts, I observed that all were perfectly well-behaved. They conversed freely together and engaged in a variety of amusements, but without tumult, disorder, or anything approaching to unseemly or excessive noise.

I made special inquiry as to the influence of so unusual an indulgence, and the answer received was substantially as follows: At their promenade in the courts, the prisoners are allowed all possible liberty. They choose their company and their subjects of conversation as they see fit. This system, far from being attended with evil consequences, is found preferable to that which forbids all converse. Down to 1862, this prohibition had effect. But obedience to such a rule was found impossible to be enforced, and its infraction drew after it a multitude of punishments whose only effect was to harden even the better prisoners, and to paralyze the softening influences of the school and the church. Nevertheless, to guard against the evil which might be done by the worse to the better prisoners, the former are excluded from these collective recreations, and are required to take their exercise in separate yards, which is a quiet but powerful means of maintaining order and preventing excesses in the associated courts.

§ 2. *Detention prison at Munich.*—After inspecting the convict-prison, Mr. Petersen and myself made a short visit to the detention prison, in the city, for the confinement of persons awaiting trial or transfer after conviction and sentence. This is a new prison, opened two years ago. It is upon the cellular plan, as all prisons of this kind ought to be, with accommodations for fifty men and fifteen to twenty women. A very few receive short sentences to this prison, but they are quite exceptional cases. It is not intended as a punishing prison, but simply a prison for safe custody. Labor is not exacted, but such as have a trade are permitted to work at it as far as there is opportunity, and are entitled to

whatever they earn. It is truly a model prison of its class. I was pleased with the director and particularly with his wife, whom I found intelligent, cultivated, amiable, and deeply interested in the future of the prisoners.

§ 3. *Patronage of discharged prisoners in Bavaria.*—The work of aiding discharged prisoners is admirably organized in this little kingdom. On leaving the detention prison, we drove to an asylum or refuge for liberated prisoners, who, on discharge, have been recommended for aid by directors of prisons to the patronage society of Munich. It is a house, with garden attached, having accommodations for fourteen men and ten women, the two sexes occupying distinct parts of the establishment and being wholly separated from each other. A porter and his wife are in charge, by whom everything is kept in perfect cleanliness and order, thus giving the place an attractive and home-like air. It is simply a transitional home for the inmates, bridging over the chasm between the prison and steady work. While waiting for this latter, the ex-prisoners either busy themselves with odd jobs obtained in the city, or in working for the house—splitting wood, making shoes, cultivating the garden, &c. There were but three in the refuge when visited by me, and they were all employed on city jobs. Their average stay in the home is about two weeks.

I had the pleasure of attending one of the sessions of the committee of the patronage or aid society of Munich, and was greatly interested in the proceedings. The business was conducted with much animation, amid a generous flow of Bavarian beer. The speeches were interpreted to me by a Dr. Strauss, and interested me greatly, particularly those on a rather novel application, which created considerable merriment, asking for money to enable the applicant to get married.

It will, I think, be worth while to go a little into detail on the organization and work of the Munich society and the general question of patronage in Bavaria. The aid society of Munich was formed in 1860, having for its object the moral improvement and material well-being of liberated prisoners who are citizens of Munich. It makes no distinction in respect of age, sex, or religion, but gives special attention to young persons of both sexes. It has a capital, including the refuge before described, of 10,060 florins. Its receipts in 1871 were: subscribed and paid by members, 1,580 florins; appropriation by the state, 750 florins; interest on capital, balance from 1870, &c., 946 florins; total, 3,276 florins. It has a membership of 1,550, composed of ladies as well as gentlemen. Each member must pay 36 kreutzers a year. Larger contributions are received from many, but they are free-gifts. The society holds only an annual meeting, but a committee consisting of forty-two members meets every Monday night. The following is the order of business: 1. It deliberates on the reports sent from directors of prisons, giving information that such and such prisoners are to be discharged, and also in relation to their character. 2. It considers and decides on the admission of these prisoners to patronage. 3. It chooses from among the members of the society guardians to take charge of such prisoners as are accepted. 4. It considers communications sent in by guardians, relating to the conduct of their wards, and decides upon the assistance to be given to these latter. 5. It acts on any financial questions that may arise.

The special duties of a guardian are: 1. To maintain a constant and paternal watchfulness over his ward. 2. To procure for him remunerative work, and to be his protector. 3. To provide for him clothing,

tools, money needed to travel in looking for work, and even, when occasion requires, to furnish him with lodgings.

Each ward has his special guardian who watches over him, counsels him, supplies his most pressing wants, takes charge of any money appropriated by the society for his use, and, if there be a necessity, endeavors to effect a reconciliation between him and his family.

The results are scarcely such as would have been expected from so much labor and care. Of the 1,182 persons who have been received as wards of the society since 1860, 377 have relapsed; 162 have withdrawn themselves from all supervision; 264 are doubtful; 27 have died, and 352 have undergone a radical change, and become completely reformed in principle and life.

In the province of which Munich is the capital city there are twenty-five districts. Societies similar to that of Munich are found in the chief cities of thirteen of them, and steps have been taken to organize like associations in the other twelve. These local societies are in all respects formed upon the model furnished by the society of Munich. Each is independent, yet all have in the committee at Munich, as it were, a central organ, which forms a bond of union between them, awakens mutual sympathies, makes them feel that they have common interests, and occasionally even advances funds, which are sometimes deficient in country organizations.

Bavaria embraces eight provinces—seven besides that of which Munich is the capital. The greater part of the chief cities of these have also their patronage societies, and very many of the small towns as well—some sixty in all; so that, including those in the metropolitan province, Bavaria, with a population scarcely, if at all, exceeding that of New York, has at least eighty prisoners' aid societies, all of them organized on the plan of that at Munich, even to the holding of weekly meetings on Monday night. The state encourages these associations with small grants of money for their work; but the most effective aid they have consists in this, that, six weeks in advance of the liberation of a convict, every prison gives information of this fact and of his character to the association which takes charge of its prisoners. The chief obstacle encountered by these associations is the distrust of the public and the prejudices which it feels and shows against contact with liberated prisoners; above all, when they have been thieves. To overcome these prejudices is one of the great duties which the aid societies impose upon themselves; and they have been to a great degree successful, particularly in Munich.

A month or six weeks before their liberation it is quite common for prisoners to write to the director of the prison a letter asking him to address in their favor a communication to the committee of such or such an aid society. In communicating such a request to a society, the director at the same time gives it all desirable information touching the conduct of the prisoner during the whole term of his imprisonment; on his occupation in prison; on the change which his treatment has effected in him, if any; or whether he has remained incorrigible. This petition is submitted to the decision of the committee at the first session after its reception. But, as the committee is composed of the most respectable citizens of the locality, men thoughtful and prudent, they are unable, ordinarily, to come to a definitive decision at their first meeting, especially as they are often ignorant of the social status of the prisoner and of his family. In cases where the committee desire to have more ample information, it charges one of its members with the special duty

of procuring it. Each petition is registered, with a summary of all the information afforded in it.

That feature in the constitution of the Bavarian aid societies by which a special guardian or protector is assigned to each liberated prisoner who becomes their ward, with the duties already described, is particularly worthy of notice. It is beyond all praise.

I have already mentioned my presence at one of the sessions of the patronage society of Munich. A copy of the minutes of that session was kindly furnished me through my friend Mr. Petersen. As it can hardly fail to have interest for those who occupy themselves with penitentiary questions, and especially for the members of prison societies, I append a translation, despite a complimentary sentence or two of a personal character.

Minutes of the session of 12th August, 1872.

President, Superior Commissioner Peekert.

Mr. Petersen, prefect, presents Dr. Wines, of New York, president of the International Penitentiary Congress of London.

The president thinks it an occasion of congratulation to be favored with the presence of a gentleman who has displayed an activity so great and so fruitful in useful results in respect of prison reform, and through whose agency the time cannot be far distant when the friends of our work, on both sides of the ocean, will lend to each other a mutual support by the intercommunication of their respective experiences.

Dr. Wines returns thanks for the honor done him, and says that his visit to Bavaria is mainly for the purpose of studying the organization of patronage in this kingdom, and making personal observation of its workings.

After the reading of the minutes of the session of the 5th August, the president remarks that Joseph Tamper, who is mentioned in them, is, in the opinion of medical men, too sick to remain under the care of the society. Thereupon, he is remitted to the charge of the philanthropic society.

Several directors of prisons announce, by letter, the approaching liberation of: 1. John Münch, potter, a workman in the manufactory of Rebendorf. After having been admitted, Mr. Auracher, member of the committee, is designated as his guardian. 2. Catherine Müller, single woman and laundress, aged twenty-four years, a prisoner at Wasserbourg and a native of Au, has the best of certificates. Accordingly she is admitted, and Mr. Fr. Barthelmes, her future guardian, promises to procure her work. 3. Mary Huber, aged twenty years, a prisoner at St. Georges, is admitted; and Mr. Ravizza is named as her guardian, in case she should need the aid of the association. 4, 5, and 6. Anna Mantel, petty thief; John Kappeller, an unmitigated gambler; and John Frey, an incorrigible vagrant, are not admitted because of their antecedents.

Louis Felser, printer, a ward of the society, asks sufficient money to defray the expense of his registry, made necessary by his approaching marriage. Several members favored the granting of this request; others opposed it. After a number of speeches, it is resolved that, before coming to a definitive decision, information be obtained regarding the character and antecedents of the betrothed.

Mr. Brucktraw, a resigned member of the society, is again received as an active member, and pays 4 florins 30 kreutzers as a subscription.

Richland, a ward of the society, having conducted himself in an exemplary manner as miller's boy at Bamberg, is voted 18 florins traveling-money.

Ward Delmoro, to enable him to take a situation offered, receives two shirts, three aprons, two robes, and one blouse from the wardrobe of the society.

The Treasurer Kinlner will have for substitute, during the time of his vacation, Mr. Comptroller Baierlacher.

After the reading of the present minutes the president invites our honored visitor to kindly affix his signature as a souvenir of his presence among us.

E. C. WINES, Secretary of the National Prison Association of the United States.

PEEKERT, *President.*

GAMPERT, *Secretary.*

CHAPTER XXXIV.

PERSONAL INSPECTION OF PRISONS IN ITALY.

§ 1. *The prison Delle Marate.*—In company with my friend Mr. Beltrani-Scalia, the very intelligent, able, earnest (the better word would be enthusiastic) inspector-general of prisons in the kingdom of Italy, I paid a flying visit to the only prison in Florence, named as above. It was only a glance that could be given to it, and it is but the briefest word that can be said of it. It is not a convict prison, but may be described, not inaccurately perhaps, as a detention prison and house of correction combined. It is on the Auburn system—association in common workshops by day, and complete separation by night. It has five hundred cells, and the number of inmates, September 22, 1871, was 376, of whom thirty were women. These latter are really in a distinct prison, for it is separated from the men's prison by a public street. Two beautiful little girls I saw in this part of the establishment—bright as new-coined eagles—the children of convict women. My heart was pained and oppressed by the thought of how much that is vile and corrupting they must necessarily see and hear and learn there.

The prison Delle Marate, though not a model, has good points. Labor seemed well organized, and among the industries, I noticed, was printing, which is one of the very best for prison inmates. Here was printed Mr. Beltrani-Scalia's *Review of Penitentiary Science*, a monthly journal of much spirit and ability, which is doing admirable service in Italy, and, to some extent, throughout Europe, in the work of prison reform. But this is a digression. The department of the prison that most gratified me was the school, which was attended by a hundred or more of the younger prisoners (in whose case, up to thirty-five, I think, attendance is obligatory) and as many of the older ones as chose. It is taught by the two chaplains, who give their whole time to religious and scholastic instruction. A very remarkable case of progress was brought to my notice, that of a lad who had been an inmate of the prison for only a month. At the time of entrance he did not know a letter of the alphabet; yet I heard him read, quite fluently, a page in a book as difficult, I should suppose, as what we call the *Second Reader* usually is. It is the most remarkable instance of rapid acquisition that ever came within my knowledge.

§ 2. *The prisons of Rome.*—There are four prisons in this city, including one for juvenile offenders. Two of these only did I visit, being accompanied on my inspection by Mr. Cardon, supreme director, and by Mr. Beltrani-Scalia, inspector-general, of prisons.

(a.) *The prison Delle Terme.*—This establishment is accommodated in a vast building, which was formerly a public granary, but has been altered to adapt it to the uses of a prison, and has been used as such for fifty years. As might be supposed, it is but ill-suited to the purpose, and is, in many ways, very inconvenient. There were four hundred prisoners, about forty of whom were women. Both sexes sleep in common dormitories, no doubt to their further contamination. The only industry practised by the men is weaving, at which the utmost they could earn was five or six cents a day. The women worked at lace-making, by which they earned four or five times as much as the men.

(b.) *The prison of San Michele.*—This prison is historic. Howard visited it nearly a hundred years ago, but it had a history before, most interesting and instructive. Howard found over the door of San Michele

this inscription: "Clemens XI, Pont. Max., perditis adolescentibus corrigendis instituendisque, ut qui inertes oberant, instructi, reipublicæ serviant. An. Sal. MDCCIV, Pon. IV." In English: Clement XI, Supreme Pontiff, [reared this prison] for the reformation and education of criminal youths, to the end that those who, when idle, were hurtful to the state, might, when better taught and trained, become useful to it. In the year of our Lord, 1704; of the Pontiff, the 4th. Within the prison, high up on a marble slab, inserted in the wall of the principal apartment, he found this—as he rightly says—"admirable sentence:" "Parum est improbos coercere pœnâ, nisi bonos efficias disciplinâ." In English: It is of no use to restrain criminals by punishment, unless you reform them by discipline. In this sentence Howard found, as all right-thinking men must find, the true aim of all just prison treatment. In the center of the room was hung up the inscription, "Silentium." So that, as would appear, the silent system of associated labor, combined with a reformatory discipline, was inaugurated at Rome in the very beginning of the eighteenth century, that is, one hundred and sixty-nine years ago. One of the main agencies relied on to effect the desired reform of the prisoners was industrial labor and the training of them to the knowledge of a trade. Various handicrafts were taught and practised in the establishment, such as printing, book-binding, designing, smithery, carpentry, tailoring, shoemaking, weaving, dyeing, and the like. Surely Pope Clement XI must be allowed a place among the most enlightened rulers and reformers that adorn the annals of our race. On some points, the world might still go to school to him with advantage. That such a doctrine should have been taught and such a practice maintained in the seat of the Papacy at a time when chains, dungeons, and tortures were almost the only forms of public punishment in the rest of the world, is a marvel. Let honor be given where it is due.

At the present time the prison appears to be of rather a mongrel sort—half cellular, half congregate. I found some four hundred prisoners there, some of whom were working in cells, and others in common shops.

§ 3. *The future of penitentiary reform in Italy.*—While engaged, in 1871, in my mission of organizing the congress of London, it was impossible to devote much time or to go at all out of a direct line from one capital to another (my business being chiefly with governments) to examine prisons. I went to nearly all that fell in my way, but to scarcely any that would require any divergence to reach them. For this reason I had no opportunity of seeing any of the more recently-constructed and better-organized prisons of Italy, of which the number is considerable. Still, I left Italy, after a very brief sojourn, (for the business of my mission was completed within twelve hours after my arrival,) with the best impressions and the best hopes for her future, in so far as the great interest of prison reform is concerned. Mr. Lanza, prime minister, and at the same time minister of the interior, who, in virtue of this latter office, is head of the prison administration; Mr. Cardon, director; and Inspector Beltrani, (I had not the honor of becoming personally acquainted with the other inspector,) are gentlemen of great ability, large views, and an earnest devotion to this work; and they are nobly seconded in it by a royal commission, composed of eminent citizens, having special knowledge of the subject, and appointed expressly with a view to making a broad study of the penitentiary question, and proposing such reforms in the criminal code, the criminal laws, and the criminal administration of the country as, after such

study, they might judge desirable and expedient. On these grounds it is not too much to hope that at no distant day Italy will become a leader whom it will be safe to follow in whatever relates to the organization and conduct of prisons, an interest which is beginning to claim its just place in human esteem, and to command the attention which is due to its magnitude and its importance.

CHAPTER XXXV.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN BELGIUM.

§ 1. *Belgian prisons.*—Of these I inspected but three—the central prisons of Louvain and Ghent, and the city prison at the latter of these places.

(a) *The prison of Louvain.*—This is the model cellular prison of Europe and the world. I paid two visits to it—one in 1871 and the other in 1872, with an admiration which no words could exaggerate. Its design, construction, and administration, for a prison of its class and on the cellular plan, seemed to me to leave absolutely nothing to be desired. More than a year ago, at a public meeting in New York, I said, of this prison:

I cannot close without a word of reference to the prisons of Belgium, which John Howard, a century ago, found worthy of praise. At present, however, I can only call your attention, for a moment, to the new model prison of Louvain, planned and built under the superintendence of M. Stevens, its director for ten years, but now inspector-general of prisons for Belgium, and a worthy successor in that office to the illustrious Duepetiaux. The building itself, which is large enough to accommodate five hundred inmates, is of brick, with marble facings. It is simple, solid, and severe in its beauty, with nothing of that palatial look which is so common in our great prisons, and which has always seemed to me wholly out of place in buildings devoted to the treatment of criminals. But it is the *inner* “glory that excelleth.” I had never conceived of anything, in the form of a penitentiary establishment, so admirable in organization, so perfect in administration. Nothing seems to have been forgotten in its construction, nothing overlooked in its rules, nothing omitted in the details of its arrangements. The system of imprisonment is that known as cellular, of which, *per se*, I am not a supporter; but the cellular system is here applied in a manner quite different from what I have seen it elsewhere. Each prisoner receives not less, on an average, than five or six visits a day, from chaplain, schoolmaster, director, trade instructor, or other officials, by whose presence and converse the burden of solitude is lightened and made tolerable, and by whose counsels, motives and encouragements to a better life are suggested and pressed upon the prisoner. The whole aim appeared to me to be the reformation of the criminal; to that all efforts appeared to be directed; and the results are as extraordinary as they are encouraging. The prison has been in operation about twelve years. The recommitments to the old prison of Louvain averaged 70 per cent.; at present they are only 6 per cent. This proves not only that criminals may be reformed, but that their reformation depends less on organization and system than on the spirit of the administration and the men who conduct it. “Where there is a *will* there is a *way*,” is a maxim which seems as true of the intent to change bad men into good ones, as of any other human undertaking.

Of the above account, written after my first visit, I do not retract a word since the second. I will say no more of the prison, (though much might be said if one could enter into details,) but must add a word in regard to its founder and first director, Mr. Stevens. He kindly accompanied me on my visit to Louvain, and directed that every possible facility should be afforded me for observation; an order which was obeyed to the fullest extent, though, from motives of delicacy, he abstained from making the round of the penitentiary with me. His heart is evidently

still at Louvain, and indeed it is no less manifestly, in its every pulsation, wholly and most intelligently, in this work of prison reform. I am sure he pursues it in his dreams, and to it his waking hours, "from morn to dewy eve," and even till night is far advanced in her dusky course, are given with all the freshness and ardor of a virgin love.

The present director appeared to be able and efficient, not unworthy to have succeeded so distinguished a man as Mr. Stevens.

(b) *Convict prison of Ghent, (maison de force.)*—It is just a hundred years since this prison was founded. It owes its existence to the genius and humanity of the Viscount de Vilain, a truly great man, who, in his conception of the nature, object, and processes of a true prison discipline, was fully a hundred years in advance of his cotemporaries. His prison was founded upon the idea of preventing crime by combating idleness, and of maintaining discipline by moral power instead of brute force; a grand conception, to whose perfect realization the world is even now slowly and laboriously working its way. Early in his vast and tireless visitations of prisons, Howard came to Ghent, where he found the prison fully organized under the guidance of its illustrious founder, with its numerous industries in active operation, with its admirable discipline maintained almost wholly by moral forces, with its incomparable order and cleanliness, the whole a hive of busy industry, by which nearly all its expenses were paid, and, altogether, the very antipodes of the English prisons, from whose inspection he had just come; it may well be supposed that his eye was delighted and his heart rejoiced. But more than this, his ideas were enlarged, and his purpose and courage strengthened; indeed, his whole being received a new and mighty impulse toward his life-work. Howard was a different man from what he would have been but for the prison of Ghent, and it is not too much to say that he was, in some sense and to a certain degree, himself the creation of the great and good Viscount de Vilain.

The prison of Ghent is of large dimensions, containing accommodations for a thousand prisoners. It is on the radiating plan, having eight wings, five of which were already built in Howard's time, and they remain to-day substantially as they were then. It is conducted, in the main, on the Auburn system, though it is partly also cellular, one wing being devoted to the treatment of prisoners on that principle. It was here, indeed, that the system which has become so widely known as the Auburnian had its origin; or rather, as I conceive, it was first practised in Rome, and was the conception of Pope Clement XI.

The director struck me as being an able, energetic man, of great administrative ability; and, withal, he is certainly a warm partisan of the Auburn as against the Pennsylvania system.

(c) *Detention prison and house of correction at Ghent, (maison de sureté.)*—On my second visit to Belgium I made a hurried inspection of the establishment named above just as the day was fading into night. It is a large, commodious, well-kept cellular prison, designed for two classes of prisoners of both sexes: 1. Persons arrested and awaiting trial. 2. Persons sentenced to short terms of imprisonment.

§ 2. *Juvenile reformatories.*—I visited but one of these, that at Ruysselede, near Ostend, which, however, is divided into three different departments, in three different localities, and forming, in effect, three distinct schools of reform—two male and one female—though all under the same head. The two for boys are at Ruysselede and Wynghene, within sight of each other; that for girls is at Beernem, two or three miles distant. I could wish that more time and space were at my command for a description of this establishment, for it well deserves the

amplest treatment. With the solitary exception of Mr. Demetz's agricultural colony at Mettray, it exceeds all others visited abroad, both in its management and its results; and in one particular, (to be hereafter mentioned,) it has the pre-eminence over Mettray and all other juvenile reformatories known to me in any part of the world.

Ruyssede is the work of Ducpetiaux, perhaps his master achievement; but he was ably seconded by a man of rare powers and aptitudes for the task, Mr. Poll, who was its first director, presiding over it from the day of his appointment, in 1849, to that of his death, in 1867, a period of eighteen years.

The present director, Mr. Eugene Poll, is a son of the late incumbent, whom he succeeded immediately on the decease of the latter. I was accompanied on this inspection by the Rev. Joshua Coit, secretary of the board of prison commissioners of Massachusetts. Though we had not the advantage of any official or even private introduction, the director received us, not simply courteously, but with the utmost cordiality. He conducted us through every department of the establishment at Ruyssede, giving full explanations of all its parts and arrangements, and answering all questions with perfect frankness.

The class of boys treated here are not criminals, properly so called; but they are such as are in danger of becoming so—vagrants, truants, street beggars, and the like. The whole number received from the beginning is about 5,000. The day we were there the number was 522, of whom only two were in hospital, and one of them from a broken arm—a clear indication of the sanitary state of the school, and of the good care that is taken of the inmates.

The institution is conducted on the congregate plan. The boys sleep in large dormitories, admirably arranged—as, indeed, every part of the establishment is—and kept in the cleanest possible condition.

The labor is principally farm-work. The farm consists of two hundred and forty acres, nearly all under tillage. The kitchen garden contains nineteen acres; but, indeed, a great part of the land seemed cultivated like a garden. The outbuildings and nearly all the accessories are arranged and kept in the best manner. In short, this may be pronounced in all respects a model farm. The stock consisted of 18 horses, 114 cows, 7 bulls, 150 sheep, 70 large hogs, 80 pigs—all in the finest order.

While the work is, as already stated, principally expended on the farm, there is also, particularly in winter, much mechanical labor, which is distributed through a considerable variety of trades, such as carpentry, smithery, painting, varnishing, shoemaking, knitting, tailoring, spinning, weaving, straw-plaiting, &c. Very few purchases, comparatively, are made for the establishment from the outer world, almost everything required for consumption, outside or inside the body, even to the manufacture of the beer, which is there deemed a necessity, being produced and worked up on the premises. Thus, for example, the wool and flax needed for clothing is grown on the farm, and the boys spin, weave, and work it up into garments. The straw (so much as may be necessary) is plaited and made into hats. The hides are converted into leather and manufactured into shoes. Stockings are knit from the wool clipped from their own sheep, for winter use, none being required for the summer. And so on to the end of the catalogue.

This extraordinary thrift, as our New England people would call it, is the cause of the existence of a fact which, so far as known to me, is wholly unparalleled elsewhere in the history of reformatory institutions. Reference is here made to the fact that the reform school of Ruyssede not only pays all expenses, including those of the administration, but

actually realizes a net profit every year of some thousands of francs. In 1874 the gain was 3,000 francs; four years previously it was 10,000. This result is the more remarkable inasmuch as a considerable number of the boys are too young to do much toward earning their support, and conscientious attention is given to the scholastic instruction of all.

The ages of admission are from seven to eighteen; in exceptional cases, boys younger than seven are received. The term of committal is during minority. The average stay in the institution is about three years. Some, however, remain only three months, others from eight to ten years.

Mr. Poll claims that, substantially, all the children sent to Ruysselede are saved. The number who turn out badly is brought down to within a fraction of zero.

The school at Wynghene has some fifty boys who have chosen for their calling a sea-faring life. Here, in a little lake, is a full-rigged ship, in which they are daily drilled in all nautical maneuvers and terminology. There are also, in a large apartment of the house set apart for the purpose, numerous models of vessels and craft of all sorts, with complete rigging, loaned by the museum at Brussels, to be used for the professional instruction of the young sailors.

For the rest, beyond the time devoted to this technical training, the boys in this department occupy themselves precisely as those do in that of Ruysselede—working on the same farm, but in shops at their own place.

Our next visit was to the girls' reform school at Beernem. This is conducted by a religious sisterhood, with a lady superior at its head, though it is under the general superintendence of Mr. Poll. There were two hundred and fifty inmates at the date of our inspection. We found it in no respect inferior to Ruysselede. The sister-in-chief is quick, sharp, accomplished, and energetic in a remarkable degree. I said to her: "Sister, I was surprised to learn that the boys at Ruysselede earn their full support. I presume that this is not done by the girls?" Very promptly she replied, and in a tone and manner indicating some little feeling: "The girls gain more than the boys; their earnings amount to 100,000 francs a year." They are chiefly employed in lace-making, sewing, and laundry work.

With a sufficient number of such establishments as those at Ruysselede, Wynghene, and Beernem established in all countries, the problem of the prevention of crime will be far on its way toward a satisfactory solution. How much *cheaper*, as well as better, would it be to save the vicious children than to punish them as criminal adults!

CHAPTER XXXVI.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN HOLLAND.

§ 1. *Military prison of Leyden.*—This prison is not for soldiers who have committed offenses merely against military discipline, but for such as have been found guilty of acts which brought them within the purview of the criminal laws of the land. The prison is a substantial structure, very plain, surrounding an open quadrangle, which serves as an exercise-yard for the prisoners, who, in companies of forty to fifty,

spend an hour there every day. On one side of the hollow square is a building containing the offices, on another is the large dormitory building, and on the two others are the shops, store-houses, school-rooms, &c. There are eight large halls for dormitories, with very lofty ceilings, each having forty-eight small compartments or cells, in all three hundred and eighty-four, every one of which had an occupant on the day of my inspection, with an overplus of four prisoners. The arrangement of the cells is unique, and it struck me as excellent. They form a double row of iron boxes extending the entire length of the hall, with an encircling corridor not less than ten feet in width. The ceiling is at least twice as high as the sleeping-rooms, an arrangement facilitating the supply of pure air. The circulation of the air is further aided by the perforation of the iron which forms the front and top of the cells. Around the entire wall runs a water-trough for purposes of ablution, each prisoner being furnished with a wash-basin of his own. His towel hangs in his cell at the head of his bed, which latter is of straw, on an iron bedstead. There are but few articles of furniture in the cells, as the prisoners take their meals in the workshops.

Among the industries pursued are shoemaking, rope-making, tailoring, carpentry, smithery, painting, &c. The prisoners are allowed half of what they earn, and of this a moiety may be spent in the purchase of additional food and other comforts during their captivity, the other moiety being kept as a *masse de réserve*, to be paid to them on their discharge. The proceeds of the one-half of the labor, which goes into the chest, suffices to defray all current expenses, except the pay of the staff, who, being all officers of the army, receive their salaries in the same way and from the same fund as other military officers.

Every prisoner, if he did not know one before, is taught a full trade, whenever his sentence is long enough for the purpose, which is by no means always the case, as the sentences run from two months to twenty years.

The proportion of prisoners wholly illiterate on entrance is 10 per cent.; most of the remaining ninety have a fair common education. Nevertheless, the whole body of the prisoners are required to attend school two hours every day. Three schoolmasters are employed, who devote each six hours a day to the work of instruction, and in this they are further aided by twelve convict assistants. All the branches of primary and more advanced common-school education are taught, to which are added, in the case of all prisoners desiring it, French, English, and drawing, particularly linear or mathematical drawing. A large room is appropriated to this last-named department.

Except in the hospital, which was exceedingly neat and cosy, the prison presented a rather slovenly appearance, and could not be commended as particularly clean. Still, it has merits, and in some points might be advantageously copied elsewhere.

§ 2. *The cellular prison of Amsterdam.*—I visited this prison in company with Mr. Ploos van Amstel, secretary of the prison board, on a Sunday morning, at the hour of divine service, and heard, in low Dutch, what I presume, from its animated and graceful delivery, to have been a very eloquent sermon; I say from the manner of its delivery this was my surmise, for I could not judge from its effect on the audience, as every man of them was in his cell, and, to all appearance, with the exception of a few keepers, Mr. Ploos van Amstel, and myself, the orator appeared to be addressing himself to empty space.

After the service, we inspected the cells and other parts of the prison, all of which were found in a state of order and cleanliness that

left nothing to be desired. It is a misdemeanants' prison, where sentences range from a few days to two years. It has but two hundred cells, of which, at the date of my visit, one hundred and sixty had occupants; forty of these were women, who were accommodated in a ward entirely separated from the part of the prison in which the men are confined.

The industries are brush-making, tailoring, carpentry, smithery, &c. The state only receives three-tenths of the earnings; the other seven-tenths belong to the prisoners. Four of the prisoners' tenths are kept by the administration as a *masse de réserve* against the day of liberation; the other three are at their disposal to send to their families, if they have any, or to spend in adding to the comforts of their prison life.

With rare exceptions, the inmates can read and write when committed; still, two schoolmasters are employed to give lessons in the cells, and thus to supplement by added acquisitions the education previously possessed.

§ 3. *Detention prison at the Hague.*—Accompanied, or rather conducted, by Mr. M. S. Pols, who had been a government delegate to the London Congress, I paid a short visit to the congregate prison, in which are confined prisoners awaiting trial and those sentenced to short imprisonments. It is an old structure, built more than three hundred years ago, and seems chiefly distinguished for two qualities—massiveness and irregularity. As far as what is material was concerned, the prison is well kept, and everything was clean as soap, water, brush, and muscle could make it. But all praise must stop at this point. Prisoners to the number of one hundred and fifty were congregated there, doing almost nothing but corrupt each other by day, and at night sleeping in common dormitories, without supervision, to continue the same business with increased vigor. Few have trades when they come, and fewer still, even of the sentenced, remain long enough to learn them. There is here an ample margin for reform.

§ 4. *Patronage.*—The work of aiding liberated prisoners is well organized in Holland, is conducted in an energetic manner, and is attended with fair success. There is a central organization, with its seat at Amsterdam, called the Netherlands Society for Ameliorating the Moral Condition of Prisoners, which has forty branches scattered throughout all parts of the country, and corresponding members in thirty-seven localities where there are no branches. The great aim of all these associations, here as elsewhere, is to save the discharged prisoner from a relapse; but to this end the work of patronage is begun in the prisons themselves. In Amsterdam, and wherever branches of the central society exist, the members are permitted and are accustomed to often visit the prisoners confined in the jails of the kingdom, with a view to guide and influence them to good. Many of the societies have committees of ladies attached, who are active in this work, and whose labors are most acceptable and useful. When I had the honor to call upon the president of the parent society at Amsterdam, the venerable William H. Suringar, then over eighty years old, he showed me a thick folio volume, filled with closely-written manuscript from cover to cover, and containing the record of his personal visits to prisoners or their visits to him, in which are set down the main facts in each case. I cannot state the number of cases in that rare book, but am sure that it runs up into the thousands.

§ 5. *The Netherlands Mettray.*—This is one of the model reformatories of Europe, and is situated at Arnheim, near Zutphen, distant five hours by rail from Amsterdam. It is on an estate named Rijsselt, formerly

the seat of a nobleman; now an agricultural reformatory colony, founded twenty years ago by Mr. Suringar, mentioned in the preceding section, and designed for vagrant and vicious boys, not yet criminal, but in imminent peril of falling. It is a close imitation of the French Mettray, and is conducted on the strict family principle. There are ten houses for boys, each capable of accommodating fifteen. They are arranged on the two sides of a parallelogram, (five each side,) with the residence of the director at one end of the quadrangle, and the beautiful little church of the colony at the other. In the rear of the director's residence are the workshops, school-house, &c. On either side of the quadrangle, but at considerable distance from the other buildings, are the picturesque residences of the sub-director and schoolmaster. A large and substantial farm-house, with all needful out-buildings, near but outside the main entrance, completes the *tout-ensemble* of edifices belonging to the establishment. The spacious square itself, around which all these structures cluster, has the appearance of an elegant garden, in the center of which is a charming flower-plot. The effect, to an observer on passing the iron gate which forms the chief entrance to the colony, is very pleasing, the *coup d'œil* offering to his view what at first strikes him as a miniature paradise.

I was the bearer of a letter of introduction from Mr. Suringar to Mr. Schlimmer, the director of the colony, who has served in that capacity from its origin, and has developed rare gifts and aptitudes for the place. The sub-director is a Mr. van Veen, who has occupied the post for only two years, during which time he has given indubitable proofs of special fitness for its duties. Mr. Schlimmer, knowing only German, committed me to the sub-director, who could speak French, and who conducted me through the establishment, explaining every part in the most satisfactory manner.

It has already been stated that the ten family houses are for fifteen boys each, and they were full, or nearly so, on the 7th of August, 1872. At the head of each household is placed a monitor, selected from among the larger boys, who acts as an under-officer during the day, and has sole charge of them at night. This system has been substituted for that of house-fathers—first, on economic grounds, and, second, because of the difficulty of finding suitable persons willing to serve the colony in that capacity. The interior of the family houses is simple and commodious, but they were not remarkable for cleanliness, and the establishment seemed to me to suffer sensibly from the lack of female care and influence. Each house has a dwelling-room, wash-room, and closet on the ground floor, and a dormitory above. The meals are prepared in a general kitchen, from which they are taken to the several houses, and each family breakfasts, dines, and sups by itself.

The labor is chiefly farm and garden work, sixty-four acres constituting the farm. There is a kitchen garden of eight acres, and a smaller garden for fruits and flowers, with nursery, hot-beds, and conservatory, where the boys are taught and trained in all the mysteries of both the ruder and finer kinds of gardening. A considerable income is derived from the sale of flowers, as well in pots as bouquets, and also from that of fruits, large and small. The occupations of the colony, additional to farming and gardening, are shoe-making, tailoring, carpentry, cabinet-making, smithery, painting, varnishing, baking, and, I think, a few others. As far as possible—and it is found possible in most cases—the boys are permitted to choose the calling they will follow. There is even a normal school and a military school in the establishment, where those whose tastes incline them to teaching or military life acquire the techni-

cal knowledge and training required for those professions. I was curious to know how many schoolmasters had been graduated from this seminary. The sub-director was unable to give the aggregate, but said that eight had gone out to be teachers during his two years' incumbency. One of these was on a visit to his former home when I was at Rijsselt. He was a stout, manly-looking youth, and seemed greatly to enjoy this renewal of intercourse with his late comrades. He reported himself as "doing well," and as satisfied with his place and prospects.

Only boys over nine and under fourteen are received; on an average, they remain two years at the colony; and their services, on discharge, are much sought after. Not more than two per cent., according to the best evidence—so Mr. van Veen stated—ever become criminals. Most of them would no doubt have followed a life of crime but for their training here. How noble and—let us not forget to say to people who do not love taxes—how cheap a charity this is, clearly appears from the fact that seven hundred and twenty boys have been admitted to its benefits, and five hundred and seventy-one have gone forth from it, to add to the productive industry of the state, instead of being spoliators and destroyers of its wealth, and no less so of its virtue.

The appearance and demeanor of these lads impressed me most favorably. One never would have guessed that they had been little Arabs of the street. Except a few low and repulsive faces, the whole company appeared well-mannered, cheerful, respectable youths. Their manly bearing and quiet, orderly movements showed the care bestowed on their bodily training, and, by what I was told, their moral training bears a fair proportion to the physical. A profane or vulgar word (so I was assured) is seldom heard, even when the boys are by themselves. The officers have succeeded in forming a right public opinion among their *élèves*, which acts with great force, and, as a consequence, have created an *esprit de corps* which finds expression in such phrases as "We are the boys of Netherlands Mettray! We respect ourselves, and mean that others shall respect us."

All the boys are well instructed in the several branches of a common-school education, and special attention is given to music. An hour is devoted daily to this branch by the whole school, not all at the same time, but in groups, according to their advancement. I was present at a class-exercise of this kind and observed how thorough and even scientific was the instruction given, and how intense the interest and delight of the boys in their work.

Every Sunday, in the morning, the boys attend service in the parish church of the neighboring village; in the afternoon at the church in the colony. Other parts of the day, deducting what is given to suitable recreations and rest, are devoted to sacred song and various religious exercises. From 7 to 7.30 on each morning of the week-days a service of prayer is held in the church, which is conducted in turn by the director, sub-director, and schoolmaster, who reads a chapter and accompanies the reading with such comments as he sees fit, and all unite in singing a hymn, while one of the boys plays the organ.

As a means of moral education much stress is laid on what is called the "sentence system." It has long since been observed that a pithy saying, a proverb, a fable, even a single word that infolds a pregnant meaning, often produces a happy and lasting effect upon the young mind. Charles Dickens, when on a visit to a reformatory in Massachusetts, being called upon for an address, said simply: "Boys, do all the good you can, and make no fuss about it." That curt, crisp sentence was better for the boys than would have been an hour of silver-tongued

rhetoric. So the conductors of the Netherlands mettray have thought it good and helpful to make much use of such sentences as these, (sometimes hanging them on the walls, sometimes giving them out to be learned by heart:) "He who seeks himself will not find God." "A poor man he, who has nothing but money." "He is a fool who lives poor to die rich." "Labor has a golden bottom." "Care for the moments, and these will care for the years."

Whenever anything extraordinary takes place in a family, or when a boy makes himself notorious by his bad behavior, a sentence is applied. Thus, on the occasion of the death of one of the parents of a boy, a consoling text or sentence is suspended on the wall of his dormitory. One day a boy was overheard using foul speech to a comrade. The sentence, "It is better to be dumb than to use the tongue for filthy talk," was given to him, which he had to read to the company every morning for eight days. It had the desired effect.

In a corner of the colony farm there is a secluded and beautiful little cemetery, where are interred the remains of twenty-three *colons*. At the head of each grave is placed a little painted board, with the name, age, &c., of the lad who sleeps beneath, and the mound surmounting the grave is planted with flowers. Near the center of the cemetery stands a large, spreading tree, with its thick branches drooping to the earth, beneath which the remains of Mr. Suringar were to be interred. Already, while I pen these sentences, in less than six months from the time of my visit, the good man who founded this noble institution sleeps peacefully in his last, self-chosen resting-place. "The memory of the just is blessed." That of William H. Suringar will be green and fresh in many a heart as long as the Netherlands Mettray continues its benign and beautiful work.

CHAPTER XXXVII.

PERSONAL INSPECTION OF PRISONS AND REFORMATORIES IN FRANCE.

§ 1. There are two distinct prison administrations in France—the prefecture of police and the ministry of the interior. The former has charge of the prisons of the department of the Seine, the latter of all the other penal establishments of France. Their jurisdictions and all their movements are as independent of each other as if they were on the two opposite sides of the English Channel. Mr. Lacourt is chief of the division of prisons for the department of the Seine, Paris; and Mr. Jaillant, under the minister, of the division of prisons for the rest of France. I called upon both these gentlemen, and had a long interview with each, with a twofold aim—first, to gain information, and, secondly, to obtain the necessary authorizations to inspect the prisons within their respective jurisdictions. *Tout le monde* had spoken to me of Mr. Jaillant as a person of rare qualities and worth, and I found *tout le monde* quite right in its estimate. I was profoundly impressed with the breadth of his intellect, the largeness of his heart, and his thorough devotion to the cause of prison reform; and the same impression was made upon me by his chief of bureau, Mr. Jules de Lamarque. Mr. Lacourt is also a noble specimen of humanity, a man of large intelligence and broad sympathies, and, like Mr. Jaillant, "well reported of" by his fellow-citizens. Mr. Jaillant kindly furnished me with a permit to visit prisons out of Paris, and Mr. Lacourt to inspect those within that city. His author-

ization, which I give as a matter of curiosity, is in these words: "The directors of prisons in the department of the Seine are authorized to admit into those establishments Mr. Wines, who has been delegated by the American Government to organize an international prison reform congress, together with any friends who may accompany him, and to afford him all the information he may desire. Mr. Wines is recommended in a very particular manner to the courtesies of the directors."

I inspected all the prisons of Paris; two central prisons, one male, the other female; and two (outside of the capital) for the detention of persons awaiting trial, and for prisoners convicted and sentenced for minor offenses.

There are eight prisons in the city, viz: 1. The Grand-Dépôt of the Prefecture of Police; the Conciergerie; Mazas; Sainte-Pélagie; Saint-Lazare; La Santé; the Grande-Roquette; and the Petite-Roquette.

§ 2. Before proceeding to any description of these establishments, however brief, it seems proper, if not necessary, to give explanations of a few terms employed in the French criminal nomenclature, which, before going abroad, had troubled me not a little for the reason that I was unable to comprehend exactly what they meant. I refer to the words *inculpés*, *prévenus*, and *accusés*. The equivalents of these words in English all designate persons charged with some offense; but the exact distinction is difficult for us to grasp. Indeed, they convey to us no distinct meanings, because there is nothing in our judicial processes to correspond to them. The *inculpés*, then, are persons who, having been arrested either on a warrant or *flagrante delicto*, (in the act of committing a crime,) are conveyed, prior to a hearing, to some prison for safe-keeping until their examination takes place. The *prévenus* and the *détenus* are *inculpés*, who have had their first hearing, and have been ordered by the committing magistrate (*juge d'instruction*) to be held for trial. But there is a difference between them. The *détenus* are prisoners held for trial on a charge of misdemeanor, (*délit*;) the *accusés* are prisoners held for trial on a charge of felony, (*crime*.) The two classes are taken before different courts for trial—the *détenus* before the tribunal of correctional justice, where the trial is by the judges alone; the *accusés* before the court of assizes, where they are tried by a jury. The account to be given of the prisons of Paris will be more intelligible for these short explanations.

§ 3. *The Grand-Dépôt of the Préfecture of Police*.—This is a prison for persons who have been arrested by the police, but have not yet had their hearing before a committing magistrate, (*inculpés*.) It is a vast pile in one of the courts of the prefecture, with a capacity for 1,200 to 1,500 prisoners; but into it, I was told, are sometimes crowded 2,000. I may remark, just here, that the committal and discharge of prisoners, not only here but everywhere in France, are made with perfect regularity. In every prison the director or keeper must have one or more registers, signed on each page by the prefect or some magistrate. These registers record the act of delivery of each prisoner, and, on the margin, the date of his discharge, as also a copy of the decree, arrest, or judgment, in virtue of which it has place. It is thus easy to be sure of the legality of every imprisonment.

The legal time of detention in the Grand-Dépôt is twenty-four hours; but such is the accumulation of business and such the pressure upon the time of the magistrates charged with the preliminary examinations, that prisoners are often detained here a week or more. In the male department there are some fifty separate cells for the better class of prisoners, and a somewhat less number in the female wards, whose inmates, I

was glad to observe, were altogether under the care of women. But the mass—and a seething mass it was of corrupt and corrupting humanity—were thrown pell-mell together. If the problem had been to create a sort of cosmopolitan exchange, where the most dangerous villains, drawn to Paris from all quarters, could meet, become acquainted with each other, and lay plans for future crimes, the intent could not have been better carried out. A hundred desperadoes, or more, are there to be seen in a single vast apartment—the scum of all crafts, the shame and terror of the city. The flow inward and outward is without interruption. The coming and going never cease. The movement is like that of a shuttle, that incessantly shoots from side to side of the growing texture. Indolent, suspicious, cunning, lovers of darkness because of the villanies that are sheltered by it, they are little to be feared when separated from each other. But here they are brought together by the law itself; they are kept in absolute idleness for days, or even weeks; they become acquainted; they organize; they plan; they know where to meet on the first moment of liberty. The young thieves learn from the old ones. They are taught the *good strokes* to be made. They are instructed in the best modes of operating, from the picking of a pocket to the breaking into a house. They learn the whole theory of crime. They are told where to find the safest receivers and the worst haunts. And so the army of crime is recruited more steadily, as well as surely, than were the legions of Napoleon by the most relentless conscriptions. The children are, it is true, separated from the adults; but not from each other. On the contrary, they are confined in association, without supervision, in an adjoining apartment, where, it may readily be believed, the precociously wicked will exercise the greatest influence. I saw there, in one of the exercising-yards, a most piteous sight—some fifty boys or more, from seven years old to fifteen, all huddled together like sheep in a pen, some of whom, from the sobs and blood and angry tones and fresh-torn garments, had been engaged in a fearful fight. In the women's ward, also, there is the same promiscuous association; and, of course, the same effect of mutual contamination. The authorities aim to keep the lewd from the rest, but those most affected with this spirit, and therefore the most dangerous corrupters, are not always known to the police. Of what evils may not such contact be the cause?

§ 4. *Mazas*.—This prison is appropriated to the *prévenus*—that is to say, persons who have been placed by the examining and committing magistrates in the category of misdemeanants, and the trial of whose cases has been assigned to the tribunal of correctional justice. It is therefore a prison of preliminary detention mainly, though there are some prisoners here under sentence. It is a strictly cellular establishment, and may be said to be the gift of Pennsylvania to France. It is the chief fruit, or at least the most tangible, of the visit of de Beaumont and de Tocqueville to this country forty years ago. It belongs to the largest class of prisons, the number of cells being twelve hundred, and the mean population a little more than eleven hundred. I cannot undertake a complete description of this immense structure. Its exterior aspect is somber and gloomy to the last degree. Stretching its lofty walls of immense hewn stones on the side of the street opposite to the station of the railway of Lyons, it offers in its dismal appearance and its intense silence a striking contrast to the animation and bustle which surround it on all sides. The moment you are fairly within, the arrangement of the entire structure is apparent. The cellular system yields up its secret on the instant. A single glance tells the whole story.

There are six vast galleries, twelve and a half meters* high, three and a half wide, and eighty long. Six enormous passage ways, radiating from the rotunda, separate the wings from each other. It is majestic, certainly, but cold and saddening as well. A staff of seventy officers, under the director, consisting of a deputy, seven sub-deputies, and sixty-two overseers, here accomplish, day and night, a wearisome service; for it is unceasing. Clothed in a blue tunic, on whose collar shines a silver star, and whose buttons have in the center an open eye, (symbolic of eternal vigilance,) surrounded by the words *Prison de la Seine*, the overseer passes and repasses incessantly from end to end of the gallery intrusted to his custody. He looks through the little hole in the door of the cells, fitly named *judas*; he stops if he hears any unusual sound; he sees everything, without being seen himself; turning mechanically between his fingers the heavy key which opens all the doors, he glides rather than walks, and at night wears list slippers, that he may pass more quietly. For the most part, he is an old soldier, formed to habits of strict discipline, and familiar with all the severities of the camp. To look at him, one would say that he forms part of the prison itself. He is silent, like it; he never smiles, and if he speaks, it is ever in a low tone. In passing through a vast cellular establishment like Mazas, one feels, unavoidably, as if he were in a sick-chamber. 'Tis an instinctive sensation, and not groundless, for moral, like bodily, lesions often partake of the character of morbid affections. By living constantly in the midst of prisoners, the keeper comes to look upon them as he does on other people; he feels neither horror nor pity. He is polite and even gentle toward them, partly, perhaps, from a kind of indifference, but also because he is advised to such a conduct. But he is no less prudent than polite, and in retiring from a cell he always goes backward. He sees that the regulations relating to the prisoners, which are simple and easy to follow, are strictly carried out. At 5 o'clock in summer, and 6 in winter, the prisoners are rung up by a bell in the rotunda. At the end of a half hour each prisoner must have his hammock rolled up and attached to hooks in the wall, and his cell swept and put in order; the doors are then opened and the night-vessels removed; at the same time the water and bread for the day's consumption are distributed. At 8 the morning soup is passed into each cell in a porringer; at 3 the evening meal is distributed; at 8 the bell rings, and the prisoner arranges his hammock, and makes his bed. This is the locking up. At 10 every light is put out, unless a special authorization is accorded by the director, who, indeed, rarely refuses it when asked. During the day the prisoner works in his cell at some one of the industries carried on in the establishment—plaiting jute-mats, making list slippers, sewing copy-books for school-children, making buttons and small iron chains, tailoring, shoemaking, working at his own trade, &c. The number of days' work done at Mazas in a year is about a quarter of a million; the aggregate earnings not far from 100,000 francs; and the average earnings per man for each day of work 40 centimes, equal to 8 cents. The contractor is represented in the prison by a foreman from outside, who chooses, by designation of the director, a number of prisoners who, being more intelligent and attentive than the rest, are made chiefs of shops, wear on the sleeve a piece of red lace, communicate with their comrades in distributing work and giving directions concerning it, and thus enjoy a relative liberty, much desired and much envied. The least infraction of the rules

* A meter is 39 inches.

costs the man thus promoted his strip of lace, sends him back to the ranks of the prisoners, and again locks the door of his cell, which the necessities of his service had required to be left open the whole day.

Mazas is well guarded. The gratings are solid; every door and gate is kept firmly locked; the walls, of which, as in all French prisons, there are two, with a wide space between them, are thick and high; the overseers have their eyes wide open, and during the night sentinels are posted in the circling space between the two inclosures just mentioned. The element of power is ever in view here, and material force seems the chief reliance. And in one respect the success has been complete. Not a solitary escape has been effected in twenty-five years, and only one attempt to escape has ever been made.

§ 5. *The Conciergerie*.—This prison is destined to the reception of men and women to be tried by the court of assizes, (*les accusés*), and of sentenced prisoners who have appealed to that court against the judgment of a tribunal of correctional justice. It is an old prison, dating back hundreds of years, which, if its walls could speak, might reveal deeds of oppression, cruelty, and torture, which would make the blood curdle. The Conciergerie is an irregular pile, inclosed within the old structures of the halls of justice, (*palais de justice*), with walls of terrific thickness and solidity, with gates and bars of massive iron, and interpenetrated through and through with startling and horrible memories. As I was passing into the apartment where Maria Antoinette was confined as a prisoner of state, I was warned to be careful; but as the special point for caution was not indicated, and I was looking only to my feet, my head came into very unpleasant contact with the iron lintel over the door, which almost made me stagger. A gentleman at my side instantly remarked: "Maria Antoinette bumped her head on that same lintel when she was brought in here." The Conciergerie is deep below the present level of the adjoining streets. Its interior has a sinister aspect—dark, gloomy, repellant. In certain of its passages, lamps, kept burning at all times, give but a lurid light. Its yard resembles a well, whose sides bristle with points of iron, which prevent all scaling. There, until within a few years, were seen, sitting or walking along the wall, groups of prisoners awaiting trial in the court of assizes. But a cellular ward has now been provided for these, which surrounds a long rectangular court. In their place have been sent police prisoners, sentenced to a single day's imprisonment. Their day is passed in this yard. They pass the night on mattresses spread on the floor of the room, and the crowd is said to be often so great that even thus space is wanting. What of evil may not a single day and night spent under such circumstances accomplish? Is not the influence of depraved men, even for so short a period, enough to draw into the paths of crime an irresolute and feeble spirit?

§ 6. *The Grand-Roquette*.—This is a dépôt for sentenced prisoners, whether their sentence is imprisonment in a central prison, in the bagnio at Toulon, or in a penal colony, in which case they are confined here after condemnation till their removal to their final destination; or to death, in which case they remain here to the day of execution, which takes place near this prison. The number of prisoners varies from four hundred to five hundred. This prison has a certain celebrity among criminals, for it is, so to speak, the vestibule of the guillotine. The system is that of associated labor by day, and cellular separation at night. The courts are large and airy; and the discipline is more severe than in the other prisons of Paris. Every morning, as soon as it is fairly light, the scene becomes animated. The heavy iron gate, which bars the

entrance, is opened to admit a huge four-horse omnibus, which comes to convey to the railway the prisoners awaiting transfer. Before their departure barbers cut their hair in such manner that the skin of the cranium, appearing between the successive ridges, gives them a zebra-like appearance; this is the distinctive toilet of the galley-slave. After this, the convict is stripped and a thorough examination made of his whole person. When this scrutiny is completed he is reclothed in a new prison garb, and his legs are fastened together by chains long enough to allow him to walk, but too short to admit of his running. Bracelets are next attached to the wrists with a key, under conditions which make it impossible for him to bring his hands to his head. The roll is then called; each convict, in replying to his name, must state the amount of peculium to his credit, which is placed in the hands of the conductor, and not given to him till his arrival at the prison to which he is sentenced. Conveyed to the railway station in a cellular omnibus, the convicts are placed in a car divided into eighteen separate compartments, which they may not leave till they reach their point of destination.

A sickening tragedy had but recently been enacted within the walls of the Grand-Roquette, when I visited it in 1871. It was the execution, the assassination rather, of the venerable archbishop of Paris and the president of the court of cassation, by those incarnate demons, the communists of Paris—two men without stain of any kind, and whom all the good revered and loved. I saw, with a melancholy interest, the cells in which they had been confined, and the spot on which they were murdered; for, surely, it was nothing less or other than murder. With several others—a half dozen, or more, I think, of inferior rank and name, but as innocent as they of any crime against the state or against good manners—they were shot down as felons for whom the sun ought no longer to shine, or the earth to yield her fruits. From their solitary cells they were conducted in silence down winding stairs, along lengthened galleries, through open courts, (where the unaccustomed sunshine brought with it a gleam of joy to their wasted and weary hearts,) and between the massive double wall, to a remote and hidden corner of the prison. Here they were ordered to stand with their backs toward a platoon of sixty soldiers, only a few paces distant. This order the archbishop positively refused to obey, but boldly faced the murderous iron rain. His companions fell instantly, on the discharge of the musketry, but the archbishop did not; whereupon, at the word of command, two soldiers advanced and, with the muzzles of their rifles almost in contact with his person, discharged their death-dealing contents into his heart. I counted more than thirty places in the prison-wall just behind where the victims fell, on which the bullets had left their mark. Before his martyrdom the good man made this memorable declaration to his assassins: "You may take my life, but, in so doing, you will but add new force to the principle which I represent."

§ 7. *Sainte-Pélagie*.—This is a house of correction, which receives men sentenced to terms of a year and less. To persons sentenced for political offenses a special ward is assigned, which is entirely separated from the others. The average population of the prison is from five hundred and fifty to six hundred. An old structure, reared more than two hundred years ago, it is but ill-suited to its present purpose. All the repairs put upon it—and they are plentifully renewed year by year—have little effect. It bends, as it were, under the weight of time, and a foul and repulsive antiquity invests it with an air and an odor that are anything but agreeable. The prisoners have no dining-hall; they eat in the open court ;

there, also, they make their toilet, at a fountain. When it rains, they take their meals in a vast hall on the ground-floor, composed of a half-dozen or more chambers, whose partitions have been removed—with portions, however, of the thick walls left still standing, and offering, everywhere, obscure angles, into which the eye of the keeper penetrates with difficulty. It is in the terrible associations of this hall that the language of villany is breathed in whispers. It is there that they boast of their high achievements in the past; there that they plot new acts of crime; there that they prepare, in advance, the good strokes they will make when the hour of their release is come; and there that they organize those combinations which keep the police ever on the alert, terrify honest people, and weary the tribunals of justice. A man enters after having committed a peccadillo; he goes out schooled to crime and ripe for the galleys.

But labor is well organized at Sainte-Pélagie, and the workshops are hives of busy industry. You see there a ceaseless activity and good work done. With sleeves rolled up and hammer in hand, workmen are fabricating velocipedes; tailors, squat and cross-legged, are busily sewing garments for establishments of ready-made clothing; they make chains; they cut lamp-shades out of paper, &c. Until recently, they manufactured chignons at Sainte-Pélagie. That industry has been given up there; but I afterwards saw it practised on a large scale in the central prison of Melun. The hair, bought from doubtful heads, gathered little by little, from all quarters, drawn out by the comb, wound round cards, thrown into the street and collected by the hook of the rag-picker, is assorted by colors, divided according to the length, cleansed in a manner that scarcely increases its attraction, and fastened by the hands of prisoners on silken threads. Thence, when massed and arranged according to the rules of art, it goes to the Rue de Rivoli, in Paris; Regent's street, in London; Broadway, in New York, and wherever else ladies, not satisfied with the covering of the head provided by nature, imagine that they can increase their charms by additions of such dubious origin.

Sainte-Pélagie is surrounded by high and thick walls, on which are stationed at night a number of sentinels; but, despite this auxiliary surveillance, escapes can and do take place. On the 12th July, 1835, twenty-eight political prisoners managed to get away. When the director, in measureless fright, went himself to report the fact to his chief, the prefect of police, the latter dryly replied with a smile, "So much the better; the republic is deserting."

§ 8. *Saint-Lazare*.—This is an exclusively female prison, devoted to the reception and treatment of several classes: 1. Women awaiting trial or sentenced correctionally for terms of one year and under. 2. Women sentenced to a central prison and awaiting removal, or to death and awaiting execution. 3. It is a house of correctional education for girls under age, sentenced according to the terms of the penal code, or placed there by way of paternal correction. 4. Prostitutes correctionally sentenced as a measure of municipal police. For each of the above categories there is provided a distinct ward. The legal capacity of the prison is 1,150, but the prisoners are often in excess of that number.

The prison is an immense pile, very ancient, with an old and decrepid look. Originally a convent, it has been turned into a prison. Good, doubtless, for the first of these uses, it is exceedingly ill-adapted to the last. With large courts, shaded by venerable trees, it has wooden stairways, dormitories under the roof, workshops, taken apparently at random, huge refectories, lofty walls, a chapel large enough, but plain

almost to nakedness, and a neat little oratory, occupying the site of the apartment of Saint Vincent de Paul, which was the cradle of the religious order of the Lazarites.

For more than thirty years the prefecture of police has sought to change this state of things. It has protested, argued, pleaded for the construction of a house destined to receive female prisoners under sixteen years, and girls in their minority, confined by way of paternal correction. It has no power, no budget; it can only supplicate. But the municipal council has turned a deaf ear; it had no money. Meanwhile, magnificent barracks, splendid churches have been reared on all sides, but no house of refuge has yet lifted its walls where female children, who have fallen in a moment of forgetfulness, and whom it is necessary to save at any cost, and to give to marriage, to honor, to maternity, may find a retreat for repentance and amendment, away from the purlieus of public prostitutes and professional thieves.

What has been the result of this economy, which wastes souls to save dollars? Just such as might have been expected. Mr. Maxime du Camp, to whose interesting papers on the prisons of Paris in the *Revue des Deux Mondes* I acknowledge myself indebted for valuable facts and suggestions, and whose expressions I have not hesitated sometimes to translate, says that every young girl who enters Saint-Lazare as a correctional leaves it vicious and corrupted to the very core of the heart. And he gives convincing proofs of this, in which, however, I do not propose to follow him; but the conclusion which he reaches is, that whoever becomes an inmate there is lost, unless saved by a miracle. These young female correctionals work in association, but sleep in separate cells. All the other inmates are together day and night. In the dormitories the beds are pressed one against the other, and in the workshops the chairs touch. It is enough to mention this fact; its corollary is but too obvious.

At Saint-Lazare, in vast structures connected with the principal building, are found the general magazines and the bake-house of all the prisons of Paris. Day and night the ovens flame and the kneading-troughs are in use. The average of bakings is thirty-two a day each, yielding two hundred and thirty loaves. The magazine for clothing is a place most interesting to visit. Under the direction of an active and intelligent woman, the shirts, sheets, socks, and caps are ranged in different compartments. Farther on you see strait-jackets of sail-cloth, buckled with seven straps, intended to restrain the resistance of the furious, or paralyze all thought of suicide in prisoners condemned to death. In another place are seen winding-sheets of heavy brown linen, in which prisoners are wrapped for burial, who have at length dropped the chains of this present life. In still another apartment are piled the blankets, waistcoats, pantaloons, and other woolen garments, which have to be protected against the injury of moths. All the linen, all the clothing worn by the prisoners of Paris, goes from this wardrobe and comes back to it again, when it becomes unfit for further use. Every year there is a general sale of the articles which are no longer serviceable. Who would believe that the tattered garments which have been used in prisons have still a marketable value? But so it is. The old linen is bought by the hospitals, which make from it an excellent lint. Paper-makers, finding there genuine hempen cloth, are eager to obtain it for the manufacture of certain fine kinds of paper best made from that material. It is sought also by railway companies, who give it to the stokers to burnish the brasses of their locomotives. The woolen rags are bought, cut up, carded anew, spun, and woven into those light

cloths which manufacturers know how to make up into garments, which are sold at low prices and yet yield fair returns.

§ 9. *La Santé*.—This is the model prison of Paris, and is, without doubt, one of the best and most beautiful in Europe. It has been recently erected, at a cost of more than 5,000,000 francs. It was built under the immediate direction of Mr. Mettetal, a member of the National Assembly, a gentleman of great ability and worth, and profoundly versed, from study, not from experience as a prison director, in penitentiary science. It will be worth while to go a little into detail in describing this prison, in order to present, in outline at least, a sort of tangible embodiment of the ideas to which his studies brought him. The prison covers about seven and a half acres of ground, is built in the form of a trapezium, and is entirely separated from all other buildings. The constructions are divided into two distinct prisons, are built on two distinct plans, and are designed for two distinct classes of prisoners. One part of the prison is for the treatment of prisoners who have had their first hearing, and are awaiting trial, (*prévenus*;) this is constructed on the cellular plan, like Mazas, and can receive five hundred inmates. The other part is for the treatment of convicted prisoners, who have been sentenced to correctional imprisonment for terms not exceeding a year; it is composed of halls, workshops, common eating-rooms, and separate cells for sleeping; like the cellular portion, it has accommodations for five hundred.

The part of the prison designed for the *prévenus* (those awaiting trial) consists of four wings, each pierced by a large nave or gallery, flanked on both sides by three tiers of cells. Each nave is lighted, partly by glass placed in the roof, and partly by a huge bay-window at the end, protected by iron bars. The chapel, placed in the circular building in which the four radiating galleries of cells terminate, communicates with the prison of the sentenced, (*condamnés*,) by means of an intermediate or connecting gallery, called the "hospital construction," (*bâtiment de l'infirmerie*.) The rotunda is surmounted by a cupola covered with tiles, like the rest of the edifice, and on the two sides rise immense draught chimneys, which serve the double purpose of heat and ventilation. The prison for the sentenced, which occupies the narrower portion of the trapezium, is to the west of the cellular prison for those awaiting trial. The exterior walls of all these constructions are of immense square stones, cemented, the partition walls being in brick. The buildings designed for the accessory services are in the irregular courts between the wings, and are of hewn stone. Those for the use of the administration are at the bottom of the first court, or court of entrance. Here all the employés are lodged, without communication with the interior. Fifteen to twenty industries—the making of mats, umbrellas, candle-boxes, &c.—are carried on in this great establishment, the prisoners in separation working in their cells, while those in association labor in silence in common work-shops. Thus, classification, industrial labor, cellular separation for the *prévenus*, association in work and separation by night for the sentenced—such are the elements of penal treatment, such the agencies of reform, employed in the mixed prison of La Santé.

Each cell in this prison is 12 feet long, 6 feet wide, and 9 feet high, equal therefore to 648 cubic feet. So perfect is the ventilation that not the slightest disagreeable odor is perceptible even in those cells where the prisoners are confined day and night.

Ingenious contrivances for overcoming grave difficulties and securing valuable facilities abound in this prison. To give an example: The altar in the chapel, which, as already stated, is in the rotunda, is so placed that the officiating priest can be seen by every prisoner confined

in the four wings of the cellular ward, the door of his cell being set a few inches ajar and securely locked. At the same time the folding-doors of the congregate part, which form the partition between the two prisons at that point, being thrown open, every prisoner in association has also a full view of the ministrant. This is but one among scores of such contrivances, all due to the genius of Mr. Mettetal.

It cannot fail to have struck the reader that the two penitentiary systems, so different in themselves, in use at Mazas and Sainte-Pélagie, are united in the prison of La Santé; both of them, however, under greatly improved conditions. Here the prisoner sleeps on a real bed, which can be raised and fastened to the wall. The table is a flap, supported on an iron standard, with a hinge for letting it down. The chair is replaced by a stool. The floor of the cell is composed of oaken boards inlaid. A special chapel, or at least special church accommodations are provided for the prisoners of each faith, under each penitentiary system, viz: Catholic-cellular, Catholic-congregate, Protestant-cellular, Protestant-congregate; and, in like manner, a miniature synagogue is consecrated to the use of the few Israelites occasionally confined here. This prison is the only one in Paris which has a sheltered wash-house, built expressly for the purpose, where the prisoners, on rising in the morning, can perform their ablutions; a fact referred to, with keen sarcasm, by Mr. Du Camp, as showing how slowly reforms are introduced, when they have to make their way against the good-will of the budget. The courts here are spacious; and in the workshops air and light enter without obstruction, and therefore in quantities to meet every necessity of health and comfort. On this prison Mr. Du Camp makes the following remark: "In presence of these two opposite systems, which are here placed side by side, under the eye of the same director, an experiment is in progress, whose results it will be easy to record, and which will afford essential aid to those who are in search of a solution of the penitentiary problem. From records thus made up may be determined, after a sufficient lapse of time, which system sends back to the tribunals the largest number of recidivists." I must respectfully dissent from this opinion, and for the following reasons: 1. The prisoners of La Santé, subjected to the two systems, belong to essentially different classes, and their treatment has in view essentially different ends; consequently, there is a diversity in the premises, which would vitiate the conclusion. 2. The cellular system is applied, at La Santé, to prisoners awaiting trial; prisoners, therefore, whose guilt or innocence has not yet been determined, and who, as a further consequence, are not under criminal treatment at all. 3. There is no difference of opinion among enlightened penologists as to the application of cellular separation to this class of prisoners; all favor it as a matter of prime importance. 4. Even the correctionals at La Santé have, as their maximum, an imprisonment of only one year, and that of the greater part falls far below that limit. Cellular imprisonment for such short periods would furnish no *data* for conclusions relating to that species of imprisonment for lengthened terms. 5. There is a general, not to say universal, agreement among students of penitentiary science, that to give a sharp, energetic notice to first offenders, mainly with a view to deterrence, the best dose is a few months of strictly cellular confinement. 6. Experiments like that at La Santé, embodying the two systems, to furnish comparative results of real value, must be conducted under two conditions: *a.* They must embrace times of such lengths, and subjects of such a class, as belong to debatable ground. *b.* They must be applied by officers free from all prejudice in favor of the one

system or the other, so that their observations and judgments shall be absolutely impartial—a condition hard to be realized.

I cannot close this account of La Santé without stating the strong impression made upon me by the intelligence and courtesy of the director, as well as by the politeness of his staff, who vied with each other in the alacrity with which they answered questions, and, in every way, sought to promote the gratification of their visitor. The same remark will apply to the *personnel* of the other prisons of Paris.

§ 10. *La Petite-Roquette*.—This is a prison, or, speaking technically, a house of correctional education, for juvenile delinquents of the male sex. There are received into it prisoners of four classes: 1. Children under sixteen, arrested but not tried. 2. Children of the same maximum age, under sentence. 3. Children *in transitu* to agricultural colonies. 4. Minor children, against whom their parents have obtained a decree of correctional imprisonment. It is on the cellular system. Think of it! Babes, almost, shut up for weeks and months in a cell! They have even separate exercise-yards. They have hoops there which they trundle in the few square yards allowed them. But the place is too strait; the hoop strikes the wall after two or three revolutions, and the children, weary of this mere mockery of play, sink down upon the ground to dream of some place of real amusement. Separation by day, separation by night, separation at meals, separation at work, separation in play-time, separation always and everywhere, and that in the case of children, the very age when freedom, play, and motion are almost an essential condition of existence—certainly an absolute condition of healthy existence. It is the saddest prison I ever saw; and it would be intolerable if it were not for the “Patronage Society for liberated juveniles of the department of the Seine,” to be hereafter noticed. Mr. Du Camp has well remarked that La Petite-Roquette is perhaps the most important prison in Paris, because its inmates are children whom it is necessary to snatch from crime, and to lift up to industry and virtue; and that therefore it ought to be managed on a different principle, and placed near Paris, on some large farm, where the children could feel the benign influence of the sun and the open air.

§ 11. *The central prison at Clermont*.—This is the largest female central prison of France; it is also the best conducted and the most successful. The site is magnificent. It stands on an eminence just outside the city, and commands a prospect as extensive as it is charming. The *germ* of the prison was an old castle of the middle ages, in which the first of the Bourbon kings was born. I was shown through the prison by the director himself, Mr. Baille, who explained everything with the utmost patience. The discipline I found equal to that of the Albany penitentiary. The order and cleanliness were most admirable. The floors of all the apartments, including the kitchen, were white from constant scrubbing. The tins, coppers, and brasses were scoured and burnished to the last degree of brightness. The prisoners’ beds were made of a mixture of wool and horse-hair. The sheets were like snow, and the gray blankets had an unusually tidy appearance. To the question how often the sheets were washed, the director replied, “Just as often as they need it;” and their appearance showed that the answer was not a cover for official neglect, but the literal truth. In reply to another question, he said that the underclothing of the prisoners would be washed three times a day, if such a thing should be necessary to cleanliness.

The women sleep in common dormitories (a plan not to be approved)—seventy-five to one hundred in an apartment—with a sister in an

adjoining room, and a monitress, herself a prisoner, in the dormitory with her fellow-convicts. There are four dining-halls. Underneath each table, and forming a part of it, is a box of the same length, divided into as many compartments as there are occupants of the table—one for each—in which they keep their salt, pepper, and vinegar, together with whatever they may have purchased for themselves. But how do prisoners come into the possession of money? I will explain. There are three kinds of sentence to the central prisons, viz, simple imprisonment, reclusion, and hard labor. The last-named of these sentences, in the case of men, are, with a few exceptions and for special reasons, served out in the bagnio at Toulon or the penal colonies; but in the case of women, in the central prisons. Now, the net earnings of all French prisoners are divided into tenths. Of these tenths, prisoners sentenced, for the first time, to simple imprisonment receive five; those sentenced to reclusion, four; and those sentenced to hard labor, three; but, in all cases, prisoners whose conduct and industry are exemplary in the highest degree may, in the discretion of the director, receive an additional tenth. *Per contra*, on each recommittal the prisoner's share is reduced one-tenth; with this reserve, however, that the last tenth can never be taken from him, so that hope may never be wholly lost. On this point it may be further stated that, in addition to the portion to which prisoners are legally entitled, the contractor may allow to particular individuals such quantities as he pleases, as a stimulus to diligence. The portion of earnings allotted to the prisoners is called *peculium*, and, in every case, it is divided into two parts—disposable *peculium* and reserved *peculium*. The latter, called *masse de réserve*, is kept for the prisoner to the day of his liberation; the former is at his disposal for the purchase, during his imprisonment, of little comforts, additional to the fixed prison rations, such as tea, milk, butter, cheese, bread, &c. This is done at the *cantine*, already explained in my account of the prison at Neufchâtel.

To the question, put to quite a number of the women, as we passed through the prison, whether they found the *peculium* an encouragement and stimulus, the answer was uniform, as it was prompt and emphatic, that they did. Some of the convicts at Clermont, who are engaged in the more skilled of the industries practised there, such as corset and dress making, earned for themselves 70 francs, equal to \$15 per month. The director informed me that he had paid women, on their discharge, as high as 4,000 francs. But these, of course, are exceptional cases. After the above statements, it will not seem wonderful that the contractor takes these women and agrees, for the product of their labor, to defray the entire current expenses of the prison, save the cost of the administration, food, clothing, bedding, ordinary repairs, &c. It is thus seen that, leaving the administration out of the account, this prison is self-supporting. There is but one other in France—a male central prison—of which so much can be said; and which, according to the official reports, not only pays its way, but earns a small surplus.

There is a department of this prison (and it exists in several others of the same class) of much interest, called “the ward of preservation and reform,” (*quartier de conservation et d'amendement*.) On the arrival of a convict, an inquiry is instituted into her past character, conduct, and the circumstances of her crime. This inquiry is conducted by a kind of court, consisting of the director, sub-director, chaplain, inspector, and matron. If it is found that she had previously borne a good character; that she had never before committed a crime; that her present offense is one not implying grave moral degradation, and that she has been reared in an honest and respectable family, she is placed in the ward of

preservation and reform. This ward, at the time of my visit, had fifty inmates. It had then had an existence and a history of six years. Of one hundred prisoners who had been discharged from it, not one had come back. Its inmates are as much separated from the rest of the convicts as if they were confined in different prisons.

On our round we visited, as a matter of course, the prison school, where were a hundred women engaged in the several exercises of reading, writing, and calculating. A more quiet, well-behaved, industrious set of pupils I never saw. A sister told me that they were very quick in mastering the difficulties of arithmetic, and of their progress in penmanship I had ocular proof. A girl who could scarcely scrawl a few letters when committed, wrote an excellent engrossing hand, and there were others not much behind her. The conditions entitling prisoners to the advantages of the school are: good conduct, sufficient intelligence, and an age not exceeding thirty-five years.

There is a library at Clermont of 700 volumes, not large considering the size of the prison; but, owing to constant occupation, the prisoners did not appear to have any great amount of time for reading at their disposal. However, seats are provided in the exercise-yards, and it is permitted to either walk or sit during the daily half hour passed there. Such as choose may devote this time to reading. The prisoners are often read to by the chaplain or a sister during meal-time. They have also a good deal of time on Sunday, during which they either read or listen to reading in the workshops.

Some interesting statistics were furnished me for 1869, as that had been a normal year, which 1870, the year of the Franco-German war, was not. The average prison population for that year was 736. There remained in prison at the end of the year 664, of whom were sentenced to simple imprisonment 379; to reclusion, 70; to hard labor, 215. The net product of the prisoners' labor was 223,224 francs; gratuities paid prisoners by contractor, 6,631 francs; total, 229,855 francs. Peculium of prisoners, including contractor's gratuities, 93,975 francs; contractor's share of net earnings, 137,880 francs; total, same as before. Judged by the number of punishments inflicted, the conduct of the prisoners must have been remarkably good, the average being but a small fraction over one a day. They were distributed thus: To prisoners sentenced to simple imprisonment, 650; to reclusionaries, 52; to hard-labor convicts, 107; the number of prisoners in the first class being 379; in the second, 70; and in the third, 215. A remarkable feature of this exhibit is that the prisoners who are sentenced for the lowest grade of offenses commit twice as many breaches of discipline, in proportion to their number, as those convicted of the next grade, and four times as many as those sentenced for the highest grades, and that a similar disproportion exists between the number of disciplinary offenses committed by the two last named of these classes. The conclusion from which would seem to be that the worst criminals make the best prisoners, on the principle, perhaps, that "practice makes perfect."

Although, as already explained, there are three kinds of sentences to the central prisons; yet, as far as treatment is concerned, these distinctions are nominal. All prisoners work together in the same shops, sleep in the same dormitories, and are in all respects subjected to the same régime.

§ 10. *Male central prison at Melun.*—This is one of the best and most successful, both economically and morally, of the French prisons. It had seven hundred inmates at the date of my visit. In cleanliness, order, discipline, and material effectiveness, it seemed almost perfect.

It has fourteen large workshops, arranged on the two sides of an immense building, with a wide hall running through the middle from end to end, from which you enter the several shops, in each one of which a different trade is carried on. I never saw workshops more conveniently arranged or better ventilated. The industries appeared well organized and effectively conducted. The moral appliances are evidently better here than in most other prisons of its class, for while the average relapses in the central prisons exceed 40 per cent., at Melun it is less than 20. Every morning there is held, in a room called the pretorium, a prison court, composed of the director, sub-director, inspector, chaplain, and perhaps some other officers, where all offenders against prison regulations are arraigned, heard, and judged with the same strict regard to justice as offenders against the laws of the land are in courts of criminal jurisdiction. This court is found, I think, in the central prisons generally, perhaps universally; it certainly is at Clermont. It is the feature most to be commended in the French penitentiary administration.

The ward of preservation and reform I found at Melun as at Clermont, and with the same good results. There are also in this prison certain cells, called cells of repression, designed for the separate confinement of dangerous and incorrigible prisoners, as the others are for that of prisoners of whose return to virtue good hope may be entertained.

The director at Melun impressed me as being a man of extraordinary intelligence, ability, and force of character.

§ 11. *Departmental prisons at St. Omer.*—I had a young friend at this ancient city, Mr. A. Corne, with whom I had corresponded for a number of years, who met me at Calais, where we first saw and embraced each other, and whom I accompanied to his official residence at St. Omer, where he held the position of sub-prefect of the department of Arras. He was a young man of rare ability and large attainments, evidently one of the coming men of France; but he has since passed away from earth, when only the first fruits had been gathered of what must have been, if his life had been spared, a full harvest of usefulness and honor.

At St. Omer I inspected two departmental prisons, viz, a house of arrest and a house of justice. The first was a prison for persons arrested and held for trial before a correctional tribunal or a court of assizes, (*les prévenus et les accusés.*) The building is old, ill-arranged, badly ventilated, and, in the basement-story, damp and unhealthy; though we have worse prisons in America. The prisoners are in common rooms by day and common dormitories by night, being thus in association the whole time, with every opportunity for mutual contamination. The second was a larger as well as less ancient structure, designed for persons sentenced to an imprisonment not exceeding three months. It was undergoing extensive repairs, and promised to be, when these were completed, a fair prison of its class, but still highly objectionable on the ground of its common dormitories. The labor, as in the French prisons generally, is let to a contractor, (*entrepreneur.*) The contractor assumes the obligation to furnish the supplies of food, clothing, and other necessary articles, at such a price, for a term of three, six, or nine years, and, in part payment, he has a right to the labor of the prisoners, but no right of control over them, or of interference with the discipline. He cannot even introduce an instructor or foreman, distinct from the *personnel* of the administration; he gets simply the product of their labor, having the right to introduce such proper industries as he pleases and the obligation to furnish occupation to the prisoners at all times.

There is another and higher class of departmental prisons, called the house of correction, to which prisoners are sentenced for a term not

ceeding one year ; but this is always at the chief city of the department, and, as St. Omer does not hold that rank, I did not see it.

§ 12. *A quasi prison.*—There is an establishment at St. Omer of a somewhat miscellaneous character, half prison and half something else. It is for the treatment of women and girls, and is under the care of the Sisters of the Good Shepherd, who are specially devoted to labors of this kind. It numbered, when I visited it, four hundred and fifty inmates, made up of four different classes, or *categories*, as they are named by the sisters. The first category was of prostitutes, one hundred and eighty in number. Most of them were young, though none are excluded on account of age. They remain many years in the institution, and it is claimed that the greater part become thoroughly reformed. For the support of this class the state allows 40 centimes (equal to 8 cents) each a day. The second category is much smaller, consisting of a select few from the first, who, because of the thorough confidence reposed in them, are in training to become sisters themselves. The third category is of girls, mostly from very bad families, who, having been convicted of some petty offense, are placed here for safe-keeping and reformation. For their maintenance the state also pays 40 centimes each per day. The fourth category consists of younger girls, orphans for the most part, either in fact or because of the desertion or vices of their parents. This is simply an industrial school, toward whose support the state pays nothing. It is a charitable institution, sustained by the gifts of the benevolent and the labor of the children. Each of these four categories forms a community by itself, entirely distinct from the others, having different buildings, refectories, schools, dormitories, &c. Their only industry is sewing—shirt-making chiefly—and their average earnings are about 35 centimes a day.

This institution, so novel in its plan, appeared to me to be one of great merit and usefulness.

§ 13. *General remarks on French prisons.*—*a.* The same characteristic—the same defect, I may say—struck me as inhering in the French as in the English prison administration ; indeed, it is not peculiar to those countries, but belongs to all, though in different degrees, and, I am grieved to add, to far too great an extent in my own. I refer to the greater attention given in them to material than to moral efficiency ; the greater effort made to secure the former than the latter. The central prisons are models of order, regularity, labor, neatness, and discipline ; but intimidation, deterrence, seems to be their chief aim. Material order is carried to its highest power ; moral order seems rather languid. Little effort, little thought even, appeared to me to be given to reformation. The system punishes, but does not amend. The administration, the legislature, the country feels this profoundly. Hence the warm interest taken by France in the congress of London. Hence, too, the important measure recently inaugurated in the national chamber under the lead of the Viscount D'Haussonville ; I mean the creation of a great commission of thirty of the picked men of France, charged with the duty of studying anew the whole penitentiary question, and suggesting the reforms needed in the penitentiary system. I had the pleasure of witnessing the deliberations of that body during an entire sitting of three hours ; and I feel persuaded that results of the highest value to France and the world may be anticipated from its labors.

b. As the fruit of the state of things described in the last paragraph, relapses increase, and the number of recidivists multiplies, from year to year, despite the many ameliorations introduced within the last half century into the penitentiary *régime*. Such a result shows the ineffi-

cacy of the principle of intimidation, when exclusively or even chiefly relied upon, and the necessity of introducing into the system, as a living element, the principle of reformation. To justify what I have said as to the increase of relapses, I cite from a work on the Prisons of France, by Pastor E. Robin, an eminent French penologist and philanthropist, who states that the percentage of recidivists in the central prisons had risen in four years (1864–1868) from 34 to 42. The latest report of the administration seen by me, that for 1871, if my memory serve, (for I have not the document at hand,) makes the recommittals in those prisons 44 or 45 per cent. In the prisons of Paris the percentage of relapses is still greater. In 1868, 60 per cent. of the prisoners arraigned before the tribunals of correctional justice had been convicted before, and of those arraigned before the court of assizes, 45 per cent. Mr. Du Camp observes that this large number of relapses proves that repression, intimidation, deterrence, is not enough; that it is necessary to repudiate the old *lex taliones*, (law of retaliation;) that, if it is just to punish, it is essential to reform; and that to attain this end, offered to every civilized nation, the prison must be made a moral hospital.

c. The wards of preservation and reformation, found at Clermont and Melun, have already been noticed. Others exist in the female central prison of Haguenau, and the male prisons of Fontevault, Poissy, Eysses, and Gaillon. The name given to this institution, ward of *preservation*, as noticed by viscount D'Haussonville in the report with which he introduced into the chamber of deputies his proposition for a penitentiary commission, suggests a pregnant reflection, viz: That, in the judgment of the administration itself, the simple fact of an imprisonment in these establishments is likely to add to the depravity of their inmates. This, continues the viscount, is a sad confession, but one which it is necessary to weigh carefully, without reproach to the administration, whose good faith and zeal it attests.

d. The dietary of the French prisons appears to have been brought down to the lowest standard, and is scarcely sufficient to meet the average necessities of the prisoners; certainly not of those whose appetite is strongest. This fact is noticed by Mr. Du Camp, who says that the food furnished to the inmates of the prisons of Paris is not sufficient for all, and that some would suffer from hunger if the *peculium* did not enable them to make some purchases at the *cantine*, which is found in every French prison. The *cantine* is an establishment belonging to the contractor, there being but one contractor allowed in any of the central prisons. The average proportion of the earnings assigned to the convicts does not vary much from four-tenths. The contractor reserves the right to sell to the prisoners, at prices fixed by the administration, supplementary articles of food—such as bread, meat, vegetables, &c. He thus pays the prisoner his *peculium*, and receives nearly one-half of it back again for commodities sold to him, in this manner retaking with one hand what he had given with the other. By such an arrangement the administration seems to confess that the rations are scarcely sufficient; and what makes this still more evident is the fact that those prisoners who are employed in the service of the house, (*service economique*), and therefore get no *peculium*, receive some *sous* from the administration, with which to purchase articles from the *cantine*.

§ 14. *Mettray*.—*La colonie agricole et pénitentiaire* at Mettray, five miles distant from Tours, in the fertile and charming valley of the Loire, was the only reformatory institution which the time at my command permitted me to visit in France; and there I had the great happi-

ness and honor of passing two days as the guest of the good man who founded it—M. Auguste Demetz. To describe Mettray in detail, in its organization, workings, and results, covering, as its history now does, a period of thirty-four years, would require a volume; whereas a glance is all that my limited space will allow. At the meeting of the Universal Alliance of Order and Civilization, held at Paris in the month of June, 1872, Mr. Demetz presented a paper under the title of “An Exposition of the System of Education employed at the Agricultural and Penitentiary Colony of Mettray, and of the House of Paternal Correction,” (*maison paternelle*.) This paper is in the nature of a report, which, as a matter of course, gives the latest as well as the most authentic information relating to this world-renowned establishment. Not only shall I not hesitate, but rather regard it as a duty, to supplement my own notes and recollections by the information afforded in this report, and in some other recent publications on the subject, notably those of Mr. Charles Sauvestre and Miss Florence Hill; and that without feeling obliged always to employ the *ipsissima verba* of those authors, or to incumber my pages with formal references or quotation marks. For a number of years the average population of Mettray has been not far from 700; at the time of my visit, August, 1872, it was 792. Of the 4,287 children received at Mettray since its foundation, 647 were illegitimate; 1,657 were orphans by the loss of one or both parents; 291 were foundlings; 595 had step-fathers or step-mothers; of 381 the parents were living in illicit union; of 889 the father, mother, brother, or sister had been in prison; and of 7 the father or mother had been sentenced to capital punishment. What a multitude of young immortals, almost without exception the children of poverty, misery, neglect, and crime; of evil surroundings and evil influences, whose name is legion! What a fearful catalogue of exposures! How few and faint the chances of victory in such a battle; how almost certain the issue of defeat and ruin, unless some helping hand, strong to deliver, should be stretched out to the rescue. It was the sight of these exposures, and the certainty of a disastrous issue in the greater number of cases, which caused M. Demetz to abandon a career that was opening to him the highest judicial honors of his country, and devote himself to the salvation of imperiled childhood and youth. He traversed Europe to find a model, and found it in the Rauhe Haus, near Hamburg, established six years before, by Mr., since Dr. Henry Wichern. It was the separation of the children into groups, called families, and the making of farm-work their principal occupation, which most struck his imagination and won his judgment in the Rough House. He chose the family principle as the basis of his proposed establishment on a twofold ground—one having reference to the officers, the other to the children. Division into families, he considers, makes superintendence more easy, direct, and kindly; more easy, because it extends over only a small number; more direct, because it brings responsibility home to one person; more kindly, because its tendency is to awaken in the head of the family, and his assistants, the sentiments of sympathy and affection. Upon the children themselves he regards its influence as no less beneficial. The authority exercised over them is paternal; they become attached to their house-father; and this mutual affection becomes a moral force of incalculable power. Then, again, this division into families (such is his mode of reasoning) facilitates the individual treatment of each child. Individualization is an indispensable element in reformatory treatment, which renders it, in the opinion of Mr. Demetz, a grave error to economize in the number of agents employed in the work. He holds that the family is the supreme of moral forces which

act upon the human race, and that every man is a reflection of the influences in the midst of which he passed his earliest years. The power of example upon the young is omnipotent. Whence can the child, reared by irreligious, disorderly, vicious parents, draw those moral principles which are the safeguard of all? The family either kills virtue, or breathes into it the breath of life. The task proposed to himself by the founder of Mettray was to create a moral constitution in the criminals who became his wards, and to substitute for the family which ruined, a family which will save them. He acknowledges that it is a fictitious family which he gives them, but claims that it has all the solicitude, all the tenderness even, of a real family. The chief takes the title of father of the family, and has all the devotion implied in that designation.

The advantages of this division into families show themselves more sensibly from day to day. M. Demetz thinks that disciplinary action and moral action have been, hitherto, too much confounded. A regiment may move at the word of command, a ship's crew at the sound of the boatswain's whistle; but recourse must be had to other agencies if our aim is to affect moral character. For this reason too many children must not be confided to the same person; and the agents must be multiplied, under penalty of simply *rearing* instead of *educating*. It is, so to speak, in single combat that we must wrestle with these young souls, if we would conquer their evil inclinations and kindle in them the sentiments of honor and virtue.

M. Demetz avers that he has taken for basis of the reformatory education of Mettray, the religious sentiment; for a bond of union, the family spirit; for order, military discipline—three elements, each strong in itself, but of immense power to hold man to duty, when combined and made to act in unison toward the same end.

The chief industry at Mettray is agriculture. The device adopted for the colony is, "To improve the earth by man, and man by the earth;" and that principle is carried out to the fullest extent. *To defend the soil, and to enrich it*, is the mission to which the colons of Mettray are called.

How well these brave youths have fulfilled the first part of this mission the following facts attest: All the colons who were from seventeen years of age to twenty, joined the army the moment the French soil was invaded by the Germans in the late war, to the number of one hundred and eighty, and fought with unsurpassed bravery. Many died on the field of battle; many others were wounded; numbers distinguished themselves by acts of special valor; four were decorated with the ribbon of the legion of honor, and nine with the military medal; and four received commissions as officers. Among those who received decorations, Mettray names with honorable pride one of her colons, aged nineteen years, an under-officer of engineers, who, during the siege of Metz, crossed the Prussian lines six times to obtain information, and report it to his general.

As regards the second part of their mission, as named above, almost the entire population of Mettray is engaged in agricultural labors during the months of spring, summer, and autumn. A vast domain, composed of a number of farms, is cultivated by them. To save time and fatigue in going to and from work, the colons are, to some extent, distributed in different localities. The main body is at Mettray, but there are two outlying establishments, to which the older boys are drafted, as their good conduct and trustworthiness merit such a distinction, for here they are under much less restraint, and live, in all respects, more like ordinary hired laborers on a farm. From one of these establishments the

boys come in and spend Sunday with the main body of the colons; but from the other only on extraordinary occasions. These outlying posts form a sort of intermediate establishment, similar to that at Lusk, under the Crofton convict system, and serve as a stage of provisional or preparatory liberty.

But though the tilling of the land is the chief employment at Mettray, and is undoubtedly better than any other for moral training, yet industrial occupation, at a variety of trades, is also provided; but these trades are all such as are required for the production of implements either for farm-work or for articles to meet other needs of the establishment. Besides the shops for the manufacture of carts, plows, harrows, rakes, &c., there are carpenters, masons, millers, tailors, sabot-makers, painters, glaziers, tin-workers, &c.; for the colony is almost wholly self-supplied. But all the colons, who work at these various handicrafts in the winter and such other times as may be necessary, also labor in the fields in summer. Thus they become master of two industries, and can be employed alternately as wheelwrights and farm-hands, a fact which makes them extremely serviceable, and causes them to be much sought after by the neighboring farmers.

As I have already said, there were seven hundred and ninety-two boys at Mettray at the date of my visit. They are divided into households of fifty, each under the care of a superintendent, called the chief or head of the family, (*chef de famille*), and an assistant who has the title of the eldest son, (*fils aîné*.) Thus are the ties of social affection re-established by a kind of adoption with a moral force that nothing ever destroys. These ties are so powerful, the attachment felt by the former colons of Mettray is so strong, that they return with joy to recount their successes in life. Every Sunday those who have found employment on the neighboring farms, come to pass the day of rest at the old home, and to take part in the exercises of their comrades. I found things at Mettray precisely as described by Mr. Sauvestre, and therefore gladly avail myself of some sentences taken from his account of the "System of Education." He remarks:

I will now try to give an idea of the mode of education adopted at Mettray, and show the ingenious means and delicate precautions by which the hearts of its youthful inhabitants are touched and softened, and their ill-feeling, craft, and perverse instincts, which before menaced society, are converted into salutary and friendly forces. I have spoken of my arrival at the colony, across parks and gardens, and how I found myself in the middle of the square without having encountered a single barrier. I came again the next day, about the same time; it was during the play-hour, and the children were amusing themselves before dispersing to the workshops. There were no walls, nor ditches, nor inclosures of any sort, nor even any guards. The games were all in full swing, when suddenly a bugle sounded; at once play was stopped, and at another bugle-call the children divided themselves into companies, according to their work. Then the band began a joyous strain, and the different groups in military style marched past the heads of families, led by their foremen. Here are agricultural laborers, gardeners, wheelwrights, millers, shoemakers; and others on their way to the school. When all had filed past, the musicians hastened to put away their instruments and join their several gangs. They go to their work as to a fête, with music to begin the day and enliven their departure; and come rain or sunshine, they bear it cheerfully and joyfully. Everything is done that can make duty attractive and induce a constant habit of performing it. The children are not pushed forward with rudeness; great care is taken not to bruise these poor young hearts, already frozen by neglect or withered by vice before they knew anything of life; they are carefully tended, and led on by degrees to goodness with gentleness and trust. It is considered a great privilege to be in the band, and one only earned by hard work and good conduct.

The heart first, the physical powers next, and then the intellect; this is the order at Mettray.

If the colons of Mettray are the object of a constant solicitude while

they remain at the colony, they are scarcely less so after they have left it. M. Demetz holds that there is no good penitentiary system without patronage, since the good moral principles which may have been implanted by the discipline of the prison, still weak and wavering, need some extraneous support to guard against the danger of a fresh fall. He considers that it is the same with the sicknesses of the soul as with those of the body, where the moment of convalescence is the most critical of all, and requires the greatest care. On this principle, the patronage of Mettray is kept up not only during three years, as is the custom in other similar institutions in France, but its duration has no limit; it is, in effect, a real adoption. Provision is made against whatever might be of a nature to compromise the future of the youths who have been discharged from the colony. Thus they need have no fear as regards want of employment, in consequence of which the workman who has no resource but the product of his labor is too often exposed to all the suggestions of want and misery. Whenever the liberated colons are without work, they return to Mettray, where they know they are ever welcome, on the sole condition that they work with energy; for M. Demetz regards it as of the last importance that they preserve those industrious habits which they formed at the colony. They are not permitted to leave until a new place has been found for them. So, also, when they are sick, they are received into the infirmary of the colony. Nor is it requisite to such admission that the ex-colon be so sick as to make it necessary that he should keep his bed; it is enough that he be unable to devote himself steadily to work. M. Demetz is of the opinion that there are indispositions which compromise the future of the workman more than a grave disease. In such cases, the workshop is closed against him because he is not well enough to labor, and the hospital refuses him admission because he is not sick enough to be nursed; but Mettray willingly opens its gate and extends to him the needed relief.

Upon the whole, after the widest and most careful inspection which two days would permit me to make, I have no hesitation in saying that Mettray appeared to me the most perfect, the most complete, the most thoroughly wrought out, and the most effectively applied system of reformatory discipline that had ever fallen under my notice. The late eminent recorder of Birmingham, England—Matthew Davenport Hill—whose opportunities of observation were far larger than mine, likened Mettray to a great and beautiful work of nature, rather than to any production of man. Nor to one who has been there and seen the wonderful creation will this comparison seem much, if at all, exaggerated. The resemblance is found both in its gradual development and in the discovery of fresh perfections the more closely it is examined. Everything about the establishment, whether in the labor, the discipline, the instruction, or the recreations—the farm, the workshop, the school, the church, the playground, the dormitory, the infirmary—all, all, without exception, seemed to converge to one point, and to have been made to yield their tribute to the great work in hand—the rescue and salvation of these young criminals, their restoration to society, with the power and the will to pursue a career of honorable, though, perchance, quiet and unheralded usefulness. The genius of M. Demetz has shown itself equal to every exigency, every emergency of his work; and in its power of originating expedients to re-awaken, almost to create virtue, though, being human, it must have a limit, it certainly has not yet reached that limit; for it is still teeming with contrivances to the same beneficent and godlike end. *Facile princeps* among reformatory men is the position readily yielded to him by the

whole body of his fellow-workers. Let the laurel be worn by him whose merit has won it.

And what has been the result of this great work? Mr. Béranger de la Drôme, in his day the highest authority in France on penitentiary matters, says that, prior to the founding of Mettray, the proportion of relapses among juvenile criminals was 75 per cent. What is it among the *élèves* of Mettray? Not more than 5 per cent. at the outside. Well does Mr. Sauvestre, in view of this state of things, exclaim, "Is not Mettray a living witness against the old doctrine of repression? What would these children have become, if sent, as had previously been the custom, to the central prisons, those educational establishments whence the inmates often go out worse than they came in?" The founder of Mettray has substituted education for punishment; to what saving effect may be seen even in the very imperfect delineation which has just been given. What precious fruits of the same kind might not our prisons for adults show, if education—meaning by that term not simply scholastic instruction, but a complete system of industrial, mental, and moral training—were *combined* with punishment, and reformation everywhere made, as at Mettray, the real and supreme aim of the treatment!

After completing my observations at Mettray, I said to M. Demetz, "You have created the best reformatory in the world." Promptly, and with a beautiful modesty, he replied, "It is because I have had the best assistants in the world." The answer was no doubt true, but not the whole truth; for the helpers of M. Demetz have been his own creation, as well as every other part of the establishment. This leads me to speak, though it must be all too briefly, of a most interesting department of the colony, its preparatory school, (*école préparatoire*), as it is called. This right arm of Mettray was created even before the colony itself. After the original buildings had been completed, M. Demetz, impressed with the just idea that the task of changing bad boys into good ones* was not one to be committed to the first comers, spent an entire year, as he informed me, aided by his devoted colleague, the Count de Courteilles, in training some twenty young men to be associated with them as assistants in their work. This school, enlarged in its curriculum and its number of pupils, and embracing a three years' course of study and training, has been kept up ever since. It is a regular normal school, specially designed for Mettray, but supplying assistants to other similar establishments. So essential does M. Demetz consider this school to the complete success of his work, that he has been often heard to say that if it were closed, the colony would be destroyed. It is through it that he obtains those devoted and efficient sub-officers, for whom Mettray has ever been distinguished; and through it, especially, he secures that unity of sentiment and of action, so indispensable in his great work of moral transformation, whereby a desolate and barren wilderness is made to rejoice and blossom as the rose. How devoted his helpers are to his person and his work will appear from two simple facts which may be told in few words. M. Demetz had secured for one of his agents a place where the work was lighter and the pay larger, and was himself accompanying the young man to introduce him to his new employer. While on the way, overcome by a sentiment of longing regret, he said: "M. Demetz, it is *impossible* for me to leave Mettray;" and despite all persuasions, back he went to his smaller remuneration and his harder, rougher work. The other fact is this: During the late Franco-German war, the live stock of Mettray—cattle, pigs, and horses

*And, *a fortiori*, bad men into good ones. E. C. W.

—had been taken by the enemy; the revenues of the colony were in great measure cut off; and half the members of the staff had felt it a duty to give themselves to the military service of the country. The half who remained, after consulting together, went in a body to M. Demetz, and said: "Sir, we know your embarrassments, and will gladly do double work and accept half pay till the state of things shall improve." M. Demetz thinks, and rightly no doubt, that such devotion could be secured only through the *école préparatoire*, and that mere chance employés would be incapable of such self-sacrifice. Mr. Hill, after a visit to Mettray in its earlier years, gives his impression of the agents in this strong language: "The founders have breathed their own earnest benevolence into the hearts of their coadjutors. Seldom have I felt so deeply interested as in the hours I spent with these amiable and intelligent young men. Their devotion to their employment, their perfect knowledge of all the principles on which the institution is founded and of the best means for carrying these principles into effect, their enthusiastic attachment to the generous men to whom France and the world owe this noble establishment, the kindness evinced in their demeanor toward their wards, and the grateful spirit in which their notice of these poor lads was received, left me no room to doubt that I was among realities, not surrounded by mere shows and forms." Every recent visitor at Mettray will agree that the venerable recorder of Birmingham has as truly described the agents of to-day as he doubtless did those of twenty-five years ago.

I am unable to state what proportion of the current expenses of the colony is met by the labor of the colons; certainly not the whole, as at the reform school at Ruyssede, Belgium. M. Demetz says that some persons allege that *Mettray is too dear*. To this he replies, first, that Mettray does a great deal of good; and, secondly, that, in the matter of economy in charity, there are cheap purchases that ruin, as there are costly ones which enrich. It is the unusually large proportion of agents which has made the cost at Mettray high, as compared with other French reformatories; but it is to that also that the large percentage of reformatations is chiefly due. The motto of Mr. Demetz on this subject is, "Reform as cheaply as you can, but *reform*."

On the same premises as the colony, but in no way connected with it, M. Demetz has organized an institution as novel in its plan as it is beneficent in its scope and action. This he calls a house of paternal correction, (*maison paternelle*.) An unhappy father, who foresaw nothing but ruin for his son, one day said to M. Demetz: "You have created an admirable institution for rescuing from vice the children of the poor; can you do nothing to save those of the rich?" Instantly his fertile mind conceived the idea of the *maison paternelle*. This is, in fact, a college for the reception and treatment of those sons of the upper and wealthier classes, with whom, because of their idleness or insubordination, the ordinary appliances of college discipline can accomplish nothing. Before M. Demetz founded his institution, which might be named a college for insubordinates, expulsion from the ordinary college was almost the only severe measure that could be employed. But so far from being a terror, it was often welcomed by the idle youth as a relief from what was felt by him as an intolerable burden. When one of these youths was reminded by a professor that, if expelled from one college, he could be received into no other in France, his prompt reply was, "So much the better; I shall then have a vacation without end." The system employed in the *maison paternelle* is that of absolute isolation, each student having two cells—one for study, the other for sleep—

with a small exercise-yard adjacent. After being placed in this establishment, he continues his lessons the same as at the college from which he has been temporarily removed, under competent professors obtained from the neighboring college of Tours. He sees none of his fellows, and feels no evil influence from their presence. Thus, left wholly to his own reflections, he retires within himself, and, generally, from one to two months is found a sufficient time to subdue his spirit, to change his habits, and to restore him to the institution from which he came, the joy and pride, instead of being, as before, the grief and shame of his family. Nothing is found so efficacious in conquering idleness as the discipline of the *maison paternelle*. Labor, which has been an object of aversion, becomes there a necessity and a consolation to such a degree that books are taken from the students as a punishment for negligence, and the want of occupation so weighs upon them that they soon beg to have them restored. Their studies are thus pursued without interruption, and with greater regularity, because free from all distractions, than under the ordinary conditions of scholastic life.

On the arrival of a pupil M. Demetz exhorts him to a quiet and obedient behavior, assuring him that he has no quarrel with his person, but only with his faults. He says to him: "Your god-father has answered for you before God; I answer for you to your family; show yourself docile, and you will have another friend to love you; resist, and you will be subdued."

The youth knows perfectly that his family has given all its authority into the hands of M. Demetz, and that if, after the first trial, he again fails in duty, he will be brought back to the *maison paternelle* and subjected to a discipline far more rigorous than before. As the feebleness of the parent is too often the cause of the evil to be cured in his son, M. Demetz says that as soon as the latter is convinced that he can no longer count upon impunity, he performs with promptness and alacrity every duty required of him. It is at the moment when the college vacation begins that the discipline of the *maison paternelle* is most efficacious. When a pupil has been idle through the year, M. Demetz says to him on his arrival, "You have rested while your comrades worked; it is but just that you should work while they rest." More logical than one would suppose, the youth is apt to be strongly impressed by this view, and generally goes to work at once, with ardor, to make up for lost time. M. Demetz promises him that if he applies himself diligently to his studies, he will grant him some days with his family before his vacation ends and he is sent back to resume his place with his fellow-students at college. Fear on the one side, and filial love on the other, cause the inmates of the *maison paternelle* to return to their institutions animated, for the most part, with better sentiments and higher purposes.

For eighteen years the *maison paternelle* has been doing the special work for which it was created. During that time more than nine hundred youths have experienced the wholesome pressure of its discipline, and perhaps—for it has long been well known to the young collegians of France, and has been a terror to the lazy and the vicious—a still greater number have felt the silent influence of its deterrent power. Of the nine hundred who have actually been within its chastening grasp, stern it may be, yet wisely loving, a number, not great in proportion to the whole, have been returned a second time; a very few have thrice made proof of its friendly severity. But the mass have been restored to a right mind and a right conduct by a few weeks or a few

months of its paternal discipline; and the remainder, with here and there an exception, after a second or third experience.

Some sentences were found written on the bottom board of a table-drawer in the room of one of the inmates of the *maison paternelle*, addressed to the person who should succeed him in the occupancy of the room. They appear to have been penned by one who had shown himself rebellious, to a certain extent at least; but they so clearly reveal the good effect of the discipline, even upon a stubborn youth, that I begged a copy of M. Demetz, who kindly caused one to be made for me. I append a translation, which cannot fail to interest the reader.

Reflections found inside his table-drawer after the departure of student No. 112.

Courage, my friend, courage! Expiate your fault, but do not abuse the pardon of your family. Take my advice, which is the result of experience. You will gain nothing by obstinacy, except to be reduced to the necessity of enlisting; it is what I have done. I have enlisted for two years, whereas, if I had listened to my parents, I should still have been happy. For you, at least, there is yet time. Enter at once on the good way; bear cheerfully your punishment, and you may still be happy. Keep my words ever in memory, and think of the unhappy friend who gives you these few counsels before leaving the *maison paternelle*. Work, behave well, and you will one day be happy. It is an old companion in misfortune, on the point of departure, who gives you this counsel. Courage! A friend,

D. M.,

*Former pupil of the College of Tours, in the belles-lettres class;
drummer in the band of said college; enlisted volunteer.*

On the day of my departure M. Demetz had all the colons called in at noon from their farm-work, and had given orders that they should dress themselves in their Sunday attire and prepare for a formal review. No intimation had been given of this, and as we were lingering at the dinner-table, after the repast was ended, I was surprised to hear the enlivening strains of military music. Hastening, as we all did, to the front porch, my surprise was increased as I looked out upon the scene that presented itself to the eye. From the rigging of the large ship that graces the center of the hollow square, around which cluster the cottages of the colony, a hundred flags floated gaily in the breeze; and surmounting all, the colors of France and the United States, lovingly intertwined, waved from the mast-head. So may they ever wave, the emblem of peace and good will, the pledge of a generous rivalry in labors directed to the progress of man in knowledge, virtue, justice, happiness, civilization! Slowly approaching, with measured step and gallant bearing, to the sound of martial music—drum and bugle and clarionet—were seen the hundreds of boys who form the colony, every household with its own standard, each of a different color; the boys dressed in check trousers and blue cotton blouses, with caps and sabots; the musicians leading the column, and the fire brigade bringing up the rear, the latter armed with helmets, hooks, hatchets, and all the weapons used in combating the devouring element. Arrived in front of the mansion, the whole company halted and remained in position, while M. Demetz, with a few others, passed in front of the entire line. The review completed, the column again took up its line of march and made the circuit of the square, when it was disbanded, and the boys separated to change their clothing and return to their accustomed labors; and I, rejoicing in all I had seen, and sorrowing that my stay might not be prolonged, retraced my steps to Tours, and thence to Paris.

§ 15. *Patronage*.—The work of aiding discharged prisoners has not taken root so widely in France as in England, Holland, Bavaria, and, perhaps, some other European countries; but as far as it goes it is well

organized, and eminently successful. This is particularly the case with the oldest association of the kind in France, and possibly in the world—the “Patronage Society for Young Prisoners and Liberated Juveniles of the Department of the Seine.” The conception of that eminent publicist and philanthropist, M. Ch. Lucas, it was organized in 1833, and is, therefore, just forty years old; and it is as vigorous and active to-day as at any period of its long and useful career. A single fact will place in the clearest light its extraordinary success: Prior to the formation of the society, sixty-five out of every hundred of the juveniles discharged from the Roquette relapsed and were rearrested within a few months after their release, and of the whereabouts and destiny of twenty-five more nothing was known; whereas now the relapses and recommittals have been brought down to between five and seven per cent., a result mainly, if not solely, due to the wise and efficient labors of the association. The aim of the society, as stated by its able and accomplished secretary, M. Victor Bournat, in his last report, is: “To save the child who has committed one, or, perchance, several offenses, without knowing their gravity, and who sees all doors, sometimes even that of the paternal dwelling, closed against him; to receive him into a house, which thenceforth becomes his family-home; to provide for him a little outfit of clothing; to find for him a place in some workshop, with a good master, where he may commence or continue an apprenticeship; to watch over him till the moment when he shall become able, by his labor, to provide for himself; to re-animate and support his courage amid the many trials of his new position; to teach and guide him in the discharge of his duties to God, his parents, and his master; to aid him, when he shall have become a workman, in starting a business for himself; to assist him at the moment of his marriage; and, in short, to make of him another master, who shall be ready to receive and help those who, like himself, may have wandered from the path of rectitude.” A noble aim, and nobly carried into effect! As intimated in this extract, the society has a house—a *home*—into which it temporarily receives its wards on their liberation, and fits them out for their career as apprentices. It is a large establishment, well appointed and well kept in all respects, with offices, chapel, dormitories, wardrobe, gymnasium, &c. Here are kept the clothes of all the wards of the society apprenticed in different parts of Paris; here all their washing is done; hither they come every Sunday to replace their soiled with clean garments, and to spend the day in receiving religious and scholastic instruction, in singing, in gymnastic exercises, in social intercourse with each other and with their patrons, and returning at night to the homes of their several masters. Here also they find a home, and a welcome, and all needed care when they are sick or out of employment. A master lately said to M. Bournat: “I take care that the apprentice you furnished me never fails to be present at your Sunday re-unions; he always comes back more gentle, more civil, more industrious.” I passed an hour at this establishment one Sunday morning, and left it filled with admiration and delight at the precious fruit yielded by this charity.

The Protestants of Paris in 1869 organized an association under the name of “Société de Patronage pour les Prisonniers Libérés Protestants,” of which Pastor Robin is the active secretary, a man of large views and large heart, who is thoroughly devoted to this work. He has just issued his first report, which shows good and effective work. So far not more than five per cent. of the society’s wards have relapsed. The members of the society begin their work within the prison walls, where they labor assiduously and successfully to give a right turn to the thoughts and purposes of the prisoners.

PART FIFTH.

LESSONS—SUGGESTIONS—RECOMMENDATIONS.

CHAPTER XXXVIII.

CONCLUSION.

The congress of London was fruitful in important and valuable lessons. I do not propose an exhaustive treatment of this point, but simply, in a single concluding chapter, to offer a few hints toward the inauguration, in the several States of this Union, of a prison discipline more rational, humane, and reformatory, that is to say, more Christian, than has heretofore been, or is now, generally applied in the management of imprisoned criminals.

§ 1. The first thing taught by the congress, and that which lies most upon the surface, is, that principles have a value denied to systems. The congress developed all shades of opinion on the question of systems. It was unanimous, or nearly so, on the question of principles. Mr. Stevens, of Belgium, one of the ablest, most enlightened, and most zealous of the partisans of cellular separation throughout the whole period of imprisonment, and Count Sollohub, of Russia, who holds that the isolation of man, or even the imposition of an obligation of perpetual silence, is a contravention of the divine will, can yet cordially unite—did, in point of fact, unite—in a common declaration of fundamental principles; principles which must interpenetrate and give vitality to every system, or it will remain, cold, dead, barren. The reason of this is obvious. Systems are but methods, processes; principles are living forces. Systems may change, do change, must change, with the climate, soil, territorial extent, manners, customs, institutions, traditions, prejudices of different countries; principles are roots, essences, powers, without which there is neither life nor energy in any organization, physical or moral. Systems are temporary and perishable; principles eternal and indestructible. Systems are human; principles divine. The former have their origin in the wisdom of man, which may err; the latter, in the wisdom of God, which is unerring. Starting with the postulate, in which the whole world is now agreed, that a chief aim of prison discipline is the reformation of criminals, the essential principles which must guide, quicken, and render fruitful this great work, are: That hope must be early planted in the breast of the prisoner, and kept there as an ever living, ever active power; that the prisoner himself must be the chief agent in his own amendment, and that, therefore, his will must be gained to that end, and his active exertions enlisted in its furtherance; that, while physical force is not to be excluded, moral forces must be made prominent, and be substituted for the former in all cases where such substitution is practicable; that the feeling of self-respect and personal dignity must be developed and cultivated in the prisoner to the utmost extent possible, and that, consequently, his manhood must be respected, and all insult and needless humiliation withheld from him;

that religion, education, and labor must be made to contribute, in harmonious combination, their powerful agency toward his moral regeneration; that both the power and the will to work, and so to earn and eat honest bread, when he is discharged from prison, must be imparted to him while he is still in prison; and that society has not done its whole duty to the criminal when it has punished nor even when it has reformed him, but that, after his liberation, it owes him the still further duty of watching over and caring for him; of doing, in fact, all it may, to encourage him, to hold him to his good resolutions, and to prevent his return to crime. These, in altered phrases, are the principles adopted by the congress; principles in which the advocates of all systems united; principles which may be applied, in their integrity and all their regenerative force, under the separate system, the congregate system, the social or the silent system, the system of shop-work or of farm-work. They may be applied, they *must* be applied, whenever and wherever the work of reformation is sincerely and earnestly taken in hand; for they are principles which belong to human nature in every age and every zone. What results? The necessity for a radical and comprehensive change, in a direction to be immediately pointed out. The great controversy, among prison reformers, has been as to the superior excellence and efficacy of the separate system and the associated silent system, of which Philadelphia and Auburn stood forth as the representatives; and the controversy has been waged chiefly on the platform and in the press, through speech spoken or written. Let the locality and the instrument of this controversy now be changed. As regards the former, let the hall of debate be replaced by the prison; and as regards the latter, let deeds be substituted for words. Let the partisans of both systems, of all systems, drop the war of words, and exert all their ability, all their energy, all their skill, all their resources of whatever kind, in broad, hearty efforts to apply the principles, in which all are agreed, to the work of changing criminals into honest men, spoliators into producers, drones into busy toilers in the hives of industry. Let all work in their own way and with tools of their own choosing, unchallenged, unmolested. I, for one, have no doubt that all will show good work. I have my own thoughts as to which will show the best; but I am perfectly willing to abide the issue, and will joyfully cast in my lot with those who are most successful in accomplishing the end, which all desire and all propose, with, I doubt not, equal sincerity and in all good conscience.

Most of us in this country have, I am persuaded, undervalued cellular separation, which is good and useful in its proper place and function. I think it ought to be applied to all the arrested and indicted, imprisoned before trial. I think it may be usefully applied to first offenders as a short, sharp, vigorous notice, and with a view mainly to deterrent effect. And I am equally clear that it should form a first stage in any and all systems for the reformatory treatment of criminals of the higher grades; and that in that case it should be applied with a considerable degree of elasticity, so that it may be made longer or shorter within limits of a far wider range than is given to it in the Crofton system as now practised in Ireland.

§ 2. No reform is to-day more essential to the introduction of a real and effective reformatory prison discipline than such a change in our criminal laws as will do away with constantly repeated short sentences for minor offenses, which are as constantly repeated by the same persons. I need not here repeat what was said in the official reports handed in to the congress from the different countries represented in it; nor what was uttered in debate upon the floor; nor the arguments so well

put in the papers furnished by the Liverpool magistrates and by Mr. Barwick Baker. But one voice came from all quarters, which was, that these ever-recurring sentences of only a few days' or a few months' imprisonment, inflicted scores, yes, hundreds of times, on the same individual for the same or similar peccadillos, constitute an evil of grave character, which requires the early and serious attention of the law-making power. No one put this matter more sharply, and it would be impossible to put it more truly, than Count Sollohub, in his report for Russia, viz, that "not only do these short imprisonments for trivial offenses do no good, but they create criminals by profession." One short imprisonment for such misdemeanors is well, but it should be a sharp and keenly-felt admonition, of a character to be really "a terror to evil-doers;" and with the understanding, very clearly imparted to the culprit, that a second offense, even though of no greater gravity than the first, would be sure to be visited with a far heavier and more prolonged punishment. The sentence should then be made long enough for reformatory processes to take effect; and in this work, time, and a good deal of it, is an essential element; for idle, vagrant, and, in most cases, drinking habits are to be broken up, and replaced by those of steady industry and absolute sobriety; in a word, the whole bent and current of the life are to be changed. If it should be objected that a long sentence is out of all proportion to a trifling offense, the reply is, that is not the point. It is not a question of so much suffering for so much transgression; reformatory prison discipline rises far above such vindictive and retaliatory considerations. It is a question, first, of the effective protection of society, but much more, of *the salvation of the man*; and whatever others may say, the man himself, on whom this saving work has been wrought, will thank you to the day of his death for any degree of kind and wise severity that may have been found necessary to that result.

§ 3. There is a principle of criminal law, not yet accepted by legislators, and therefore not incorporated into the criminal codes, but approved by many of the deepest and wisest students of penitentiary science—practical men as well as theorists, those who have studied that science in the prison as well as those who have studied it in the closet—the introduction of which into our penal legislation would not only meet the objection mentioned in the last section, but greatly facilitate the important reform there suggested. I refer to the imposition of indefinite sentences instead of time-sentences, under which the prisoner would be released only on satisfactory evidence of reformation, and not as the result of mere lapse of time. I have said that some of the best thinkers and workers in this department of social science have given their adhesion to this principle. Among these may be named Hill, Maconochie, and Miss Carpenter, of England; Despine and Bournat, of France; Guillaume, of Switzerland; and Dwight, Sanborn, and Brockway, of the United States. These names are not the symbols of a dreamy fanaticism; they represent calm thought, careful inquiry, cautious and solid judgment; they are names of the highest authority in their respective countries, and some of them are known and influential far beyond the limits of the lands that gave them birth. Dr. Despine goes so far as to say that the application of this principle will become a necessity, whenever a really reformatory prison discipline comes to be generally introduced and pursued in sober earnest. Maconochie's idea was peculiar. He did not propose the imposition of a sentence indefinite in form, but only in operation and effect. This sentence took the shape of marks; so many hundred or so many thousand good marks, to be earned by industry,

studious habits in school, and general good conduct, as the condition of his release. But there was a further peculiarity in his system. In it marks had a financial as well as a moral value. He would give nothing to prisoners beyond bread and water and the roughest sleeping accommodations, except what they earned and paid for. So his marks were made to represent money, as well as progress towards liberation. They were so adjusted that a prisoner, by the utmost diligence and carefulness, the practice of which was thus made to spring from an inward impulse, could earn such a maximum number daily. A certain tale of these, say one-half or two-thirds, must go to supply his bodily and mental necessities, (for even his schooling had to be paid for;) so that only the surplus, the savings, so to speak, counted towards his release. An incidental advantage, of the highest value, is obvious at a glance, as a resultant of this system. It taught the prisoner practically what economizing is, and made him *feel* its necessity and value. He might, if he chose, spend the whole of his marks, that is, of his earnings, as he went along, in which case he made no advance towards a discharge, but became, *by his own election*, a prisoner for life; or he might deny himself many little comforts and luxuries, in which case, on the other hand, the hour of liberty, the sweetest possession of man, was constantly approaching, and that with comparative rapidity. What has thus far been said has been upon the assumption that the prisoner earned his maximum of marks. But there is a further and no less important view. If he was idle or disobedient, and only earned marks enough for his support, he made himself a life prisoner as effectually as if he had earned and expended the whole tale; and always, be it carefully noted, by *his own free choice*. Captain Maconochie was never permitted to apply his system in its entirety; prescriptive ideas and red tape forbade such freedom of thought and action; but the mere shreds of it, which were all he was allowed to employ, wrought, in cases without number, transformations on Norfolk Island which seemed little less than miracles; insomuch that he could say, in words of strictest truth—for the testimony to that effect is too strong and too respectable to warrant either doubt or denial—"I found the island a turbulent, brutal hell; I left it a peaceful, well-ordered community."

I feel strongly inclined to favor this fundamental idea of the Maconochie plan, for it seems to me that very few criminals could come out of such a crucible without being purified and refined, at least to such a degree as to become fair citizens and inclined to live by honest toil rather than through depredations on the community. But Mr. M. D. Hill, who has written most and written best on this question, for he has written with a force of logic which has carried conviction to thousands of minds, and which no adversary has yet been able to meet—propounds the system of indefinite sentences pure and simple, that is to say, sentences terminable only on satisfactory evidence of reformation, never as the consequence of the mere flux of time. However consonant this position may be to reason and natural justice—and I believe the accord to be perfect, since, if the protection of society, as all men hold, is the end of imprisonment and its justification, there is the same reason for keeping as for putting a man in prison, so long as you are morally certain that, if set at liberty, he will go out to prey upon honest people, and rob them of the quiet and the comforts to which their honest toil has entitled them—it is extremely doubtful whether society will, or could, ever become reconciled to so great a change on the sudden as that from determinate to wholly indeterminate sentences. If, therefore, the principle is ever to receive a practical application, it is likely that it must

be under certain limitations; that the courts must assign a maximum to the duration of the punishment, leaving a discretion, greater or less in extent, to the authorities who are charged with carrying the sentence into effect. To this extent the principle is already measurably familiar to the thought and the practice of our own and other countries. It is the principle of all the sentences to our refuges and reform schools for juvenile delinquents, where it is applied with the best effect. It is applied also, though to a less extent—for with us sentences are mostly during minority—to similar institutions in foreign countries, and notably to Mettray, the most successful reformatory in the world for young criminals, where, if I do not mistake, the director has almost unlimited discretion. It exists in all countries where provisional or revocable liberation is practised, under the ticket-of-license system or otherwise. It is found in all those state prisons of our country where what are called commutation laws are in force—that is, laws which allow an abbreviation of the term of imprisonment, to the extent, in some States where the sentence is long enough, of one third or more of the entire punishment, and that without any power of revocation. So excellent is the effect of this remission, granted only as the fruit of industry, obedience, and good conduct, that it is generally regarded as being the greatest advance in prison discipline ever made among us by any single measure. The same principle is applied in the sentences to the work-house on the state farm of Rhode Island, where a term of three years may be assigned by the magistrate for even trivial offenses, while the governing authority, the Board of Public Charities and Correction, is intrusted with the power of releasing a prisoner whenever it may, in their judgment, be done to his advantage and that of the community. The results in this case have not, I believe, been all that was anticipated, but it is thought that the disappointment is due to a faulty administration, the board not having as yet found the right man for the place. This principle was also similarly applied, for a year, to one class of female prisoners in the Detroit House of Correction, under Mr. Brockway, with the most encouraging results; but, unhappily, the supreme court of Michigan decided the law to be unconstitutional under which these imprisonments had taken place; not, however, because of the principle under consideration, but upon some other ground.

So that it is not so much a new principle which is sought to be introduced into our criminal laws and administration, as it is the application, in a more comprehensive, well-adjusted, thorough, and effective way, of a principle already known, and whose value has been, to a certain extent, tested and recognized.

Undoubtedly before it would be safe and wise to give to this principle the wide application proposed, even under the limitations which have been named, some very radical reforms must be introduced into our prison systems; for it would be little less than madness to attempt such an experiment, without officers qualified to undertake it, or an official tenure permanent enough to conduct it to its normal issue.

§ 4. Centralization in every branch of the public administration—that, for example, which embraces prisons, as well as others—may exist in various degrees. It may absorb all power; it may be wisely and duly tempered with local authority; it may be feeble and languid, the local overshadowing and dominating the general; or it may be wholly wanting, with the different parts of the system, like so many separate grains of sand, unconnected by any organic principle or cohesive force of whatever kind.

The last of these propositions describes the state of things gener-

ally—universally, indeed, as far as I know—existing among us. To the best of my knowledge and belief, there is not a State of our Union in which the various institutions looking to the prevention and repression of crime constitute a unit, or even a homogeneous system, held together and administered by a central power. Yet, without something of this sort, it is impossible that broad, thorough, permanent, fruitful prison reforms should take place.

As long ago as 1850, a parliamentary committee in England expressed the opinion, in reference to the county and borough prisons, that "it is desirable that the legislature should intrust increased powers to some central authority;" a reform not yet carried out in that country. Movements in this direction have been begun in several of our States, with more or less breadth of scope, and with varying prospects of success. I look upon it that, in any comprehensive re-organization of the prison system of a state, the creation of a central authority, having general powers of direction and control, is an essential feature. Without some such power, ready at all times for deliberation and action, there can be no consistent administration, no experiments conducted on any uniform plan, no wide generalizations, no establishment of broad principles of prison discipline, no application of such principles in the use of common methods; with it, all these things may be. Nor is such central and supreme authority at all inconsistent with local boards acting in unison with it. But with or without local boards, either a general board or a general superintendent, seems to be essentially requisite, to the end that all the preventive, reformatory, and penal institutions of a state may be molded into one harmonious system; its parts mutually answering to and supporting each other, the whole animated by the same spirit, aiming at the same objects, and subject to the same control, yet without the loss of the advantages of voluntary aid and effort, where such are attainable and of the right kind, and with the co-operation of local boards, if they should be deemed desirable.

England, as before stated, is without such a system, so far as her county and borough jails are concerned, though possessing it in the management of her convict prisons. Switzerland suffers, as we do, from the jealousy and power of local administrations; while in some other of the continental states of Europe, possibly in most of them, centralization is in excess.

§ 5. Another reform, equally essential to a genuine reformatory prison discipline, is the elimination of partisan politics from the control of our prisons, and the creation of a permanent administration for each. There is scarcely a State—Pennsylvania is probably the most conspicuous exception—in which political influence is not the dominating power. Too often the prisons constitute a part of the political machinery of the State, and, in their management, the interest of the convict and the community is sacrificed to the interest of the politician. This is the bane of our penitentiary systems. It lies at the root of most of the evils connected with them, and, in particular, it is the cause of that instability in the tenure of office and want of permanence in the executive administration, which render improvement difficult and perfection impossible. The utility of party politics is freely acknowledged. Within its proper sphere it has a generous and noble function. But there are things which it touches only to mar. Religion is one of these; education is another; and surely the penal institutions of a state form a third, since they combine the characteristics of both, being at once, if they are what they ought to be, religious and educational establishments.

An article framed by the Prison Association, of New York, was in-

incorporated into the amended constitution of that State by the convention of 1867. The constitution, as a whole, was rejected by the people, and the prison article fell with the rest. At the session of the legislature following that rejection, it was offered in the form of a joint resolution, recommending its adoption to the people of the State, and passed the senate by a unanimous vote, but failed to receive the action of the lower house. The next winter it passed the senate again, with one negative vote, but was rejected by a small majority of the assembly. On the third trial, at the subsequent session, it passed both houses. It must receive a second affirmative vote by the legislature, with a new senate as well as assembly, after which it goes to the people of the State for their suffrage. There is little doubt that the popular vote will be favorable. But would its adoption be a reform? I think so; and one of the highest value to the cause of prison discipline in New York, and, through the great influence of that State, in the whole country. It creates a board of five prison managers, to be appointed by the governor and senate, and to hold office for ten years, one vacancy to occur every two years. This board is to be put in immediate charge of the State prisons, and to appoint the principal officers, viz, warden, chaplain, physician, and clerk, but to have no power of removal, except for cause, stated in writing, and after a fair hearing, that is, on impeachment. The warden, being responsible for the state and discipline of the prison, and to be held rigidly to that responsibility, is to have the sole power of appointment and removal of his subordinates, the agents who are to execute his will; subject, as a matter of course, to his general responsibility to the board. The managers are to have no salary, but are to appoint a secretary, who will, it is understood, receive a compensation that will command the very best talent in the market. The board is invested, by the proposed article, with no direct power over the other pena or reformatory institutions of the State; but, as the intention of its framers was to make, ultimately, the whole system a unit, it provides that the said board shall possess such powers and perform such duties in regard to all the other penal and reformatory institutions of the State as the legislature may from time to time direct.

From the above statement it will be seen what an immense advance would be gained to prison reform by the incorporation of the proposed amendment into the constitution of New York. The administration would be at once lifted out of the slough of politics, and made absolutely permanent, except in cases where incompetency or malfeasance should make the removal of the head necessary to the proper government and efficiency of the prison committed to his charge. At present the state of things is, almost everywhere in our country, quite the reverse of this. Both appointments and removals are made on party considerations chiefly, if not solely. Men are inconsiderately placed in office without reference to their fitness; and they are remorselessly removed from office as soon as they have learned—often before they have learned—their duty. Can it be expected that we should have effective service on such conditions? Can it be expected that men will do their duty efficiently and honestly, who know that, despite their utmost diligence and fidelity, next week, or next month, or next year, their places will be taken from them and given to others? Would mercantile houses, would banking and insurance companies, would railroad corporations, be willing to employ their agents on this plan? To ask such a question is to answer it. We complain of the inefficiency and corruption of our prison officials; yet we could not devise a scheme of administration better adapted to produce these evils than the one actually employed. Would not men be

almost more than human who, under such circumstances, would do their duty faithfully and effectively?

Happily, the prison systems of the Old World are not burdened with this weight nor impeded by this obstruction. I made special inquiries upon this point, and satisfied myself that there is not a country in Europe in which political influence is felt as an evil, so far as prison administration is concerned. Nor was there anything so incomprehensible to gentlemen connected with prison affairs in those countries as this state of things among us. It was a perpetual wonder to them that anything could be accomplished in this department under such circumstances, and especially that so much good work could be done as they freely gave us credit for.

§ 6. The machinery of our penal systems, if that is the right word by which to represent the series or classes of institutions designed to effect a diminution of crime, stands in urgent need of re-adjustment and reform. As this branch of the general question lies in my mind, the series should embrace five gradations, to wit, preventive institutions, juvenile reformatories, county jails, houses of correction, and state prisons, with appendages to each of the two last named, having the general character of the Crofton intermediate prison. It will be necessary to compress what I have to say on each class into a narrow compass. Before proceeding, however, to sketch the system, a single preliminary observation may be excused. It is this: As a preparatory step, laws ought to be enacted by which the education of all the children of the State should be made compulsory. It is far better to force education upon the people than to force them into prisons to pay the penalty of crimes, of which neglect or ignorance has been among the chief causes.

a. Preventive institutions, strictly so named, are the first in the series. We enter into life with various proclivities, which may be developed and molded to virtue by education and the good examples and salutary influences of home. But to what dangers are those exposed who lack these advantages? And what multitudes of children, neglected or abandoned almost from the cradle, are deprived of them, and hence are exposed to all the fatal consequences of that deplorable condition. If their first steps in the world are marked by a violation of the laws of society it is, most frequently, because they have no knowledge of those laws. Not a few of these unhappy beings never knew, and will never know, to what parents they owe the light. One-fifth of them are orphans in the full sense. Half the remainder have lost their father, a fourth part their mother; and nearly all who have known a family have been dragged by it, either through example or direct incitement, to vice and crime, so that, in their case, the family relation is actually worse than orphanage. These general statistics, which are repeated from year to year, in different states and in all countries, afford a full explanation of the precocious wickedness of these unfortunates, who are, in some sort, devoted, driven to crime by the circumstances of their birth or by their early surroundings, so that society, which lays its strong hand upon them the moment they disturb its repose, punishes them, in the greater number of cases, for faults which, in reality, are not theirs; faults for whose commission society itself, which inflicts the punishment, has a grave responsibility—graver than, perhaps, it is aware of, or is willing to admit; for, if it had been awake to its duty and been wise, it might have prevented these violations of its laws at a cost far less than it is obliged to incur in punishing them. It is precisely at this point that the proposition comes in—may I not say, that the *duty* presses itself upon the public conscience?—for the establishment of preventive institu-

tions, by whatever name they may be called— orphan-asylums; news-boys' homes; industrial, truant, or ragged schools; children's aid associations; juvenile asylums, homes for destitute children, &c., &c. Institutions of this sort should be multiplied tenfold, a hundred-fold, throughout the length and breadth of the land. Into them should be gathered, to the last one, the children of whom I have spoken—fatherless, motherless, homeless, or worse than either, because their homes are but schools of vice, with the parents for teachers!—into these shelters and retreats should they be gathered to receive that mental, moral, religious, and industrial training, not otherwise attainable by them, and thence to be sent out, in due time, to good places on farms or in the workshop, where they would grow into virtuous and useful citizens, adding to, instead of preying upon, the productive industry of the country. I could wish for time and space to develop the ideal of such institutions, as it lies in my thought, but can only, in the most general terms, express the opinion that all the arrangements in them should be such as to cultivate industrious habits and prepare their inmates for the stations they are afterward to fill. The kitchen, the wash-tub, the sewing and knitting room, the workshop, the farm, and, above all, the school-room, together with such recreations as may be suitable to their years, should occupy the time of those who find a home there; and this home should be, though tidy and attractive, yet of the plainest character, the counterpart, as near as may be, of the homes of farmers or mechanics in moderate circumstances, such as they themselves will be likely to have when they become fathers or mothers, with households around them.

Is the expense of such establishments made a point of objection? I will reply to the objection by a short relation. In every district of Sweden, a country far advanced in her school system, there is an officer called the "persuader," whose duty it is to look after children without family, or whose parents are in prison. Those whom he *persuades* (and his methods, it may be believed, are somewhat summary as well as potent) are placed in special schools, where, instead of pests, they become useful members of society. An Englishman, visiting Sweden, asked a Swedish gentleman whether the care of the children picked up in the streets and highways was not costly? The answer was: "Yes, it is costly, but not dear. We Swedes are not rich enough to let a child grow up in ignorance, misery, and crime, to become afterward a scourge to society, as well as a disgrace to himself." There is a whole volume of fact and philosophy in that curt reply. There can be no doubt that a judicious system of *prevention*, such as here proposed, would be the highest economy, for it would cut off the most copious source of adult crime, and thus effectually stop an incessant and tremendous drain upon the wealth of the state.

b. The next class of institutions in the series is the juvenile reformatory, intended, not like the preceding, for children and youths who are in danger of becoming criminals, but for those who have actually committed criminal acts. The constitution and design of this class of establishments are so well known, and their management, for the most part, so excellent, both in our own and other countries, that it is quite needless to enlarge upon them. All that I deem it necessary to do—and in this I would place the highest possible emphasis—is to urge their establishment in States where they do not now exist, and their multiplication in all. Most European countries are far better provided with them than we are, while in our extended territory and unprecedented demand for labor we have advantages denied to them for dis-

posing in a hopeful manner of those who have been made the subjects of their discipline.

Establishments appropriated to *young prisoners* are, beyond all contradiction, the leading point in every penitentiary system. To reform the criminal masses, it is with childhood that we must commence; it is to the fountain-head that we must apply the purifying agencies. We too often forget that it is these insubordinate and perverted children who, at a later period, will form the generations of adult transgressors whose crimes will disturb and terrify society.

It seems to me that there is great need of a class of reformatories or juvenile prisons for boys and young men too old for the ordinary reformatory, yet too young for the state prison, though guilty of crimes ordinarily punishable by sentence to that class of prisons. An institution of this kind, called an industrial reformatory, is now in process of construction at Elmira, New York. This experiment is of the highest importance to penitentiary science, and its progress will be watched with a lively interest by the friends of prison reform in this and other countries.

c. The third class is the county jail. I have no hesitation in declaring the county-jail system of the United States a disgrace to our civilization; and there is no department of our repressive agencies in which the hand of reform is more imperatively needed. The great evil of the jail system is the promiscuous intercourse of the prisoners with enforced idleness, there being, in general, no classification, except that which results from an imperfect separation of the sexes, and no labor at all. From this unchecked association and want of employment it results that our jails are but schools, maintained at the public cost, for instruction in vice, and for providing an unbroken succession of thieves, burglars, and profligates. The stripling who has been committed for vagrancy or some trifling offense, locked up without employment in company with accomplished villains as idle as himself, listens to their narrative of crime till he pants for the hour of liberty, that he may commence the same bold and, to his childish imagination, brilliant career.

The county jail is now made not only a place of detention for prisoners awaiting trial, but a place of punishment for minor offenses, to which persons are sentenced for periods varying from a day to two years, and that so repeatedly that many get the name of revolvers, on account of the frequency with which they come back. This class of prisons should, in my opinion, be limited in its functions to two classes of prisoners, viz: 1. Persons under arrest and awaiting the preliminary hearing, or under indictment and awaiting trial. 2. Persons undergoing their punishment for a first offense. Both classes should be subjected to the strict cellular régime; the first because their punishment, as already explained in a former section, should be made strongly deterrent, a real intimidation, and, therefore, should be undergone in a separate ward; the second, for reasons to be immediately explained.

It is a principle of criminal law that an accused person is to be presumed innocent until he has been proved guilty. While there can be no doubt that society has the right to subject its members, under certain circumstances, to preliminary detention, it is as undoubted a corollary from the principle just stated that the exercise of this right ought never to take on a penal character, and that the accused himself must be protected, as well as the interests of social order. The sole object of such preliminary detention is to prevent escape and the possible defeat thereby of the ends of justice; consequently it is but a precautionary measure, which leaves untouched the ultimate question of guilt. It follows that

the person of the accused is a deposit, confided to the magistrates pending the decision of that question, to be returned to society, if he is proved innocent, as pure and sound as when received. Hence all the care and consideration due to innocent citizens must be accorded to these persons, so long as the presumption of innocence remains in their favor. Hence, too, it follows that the accused and the convicted should receive a treatment materially different the one from the other, and that the prison for detention should be quite another thing than the prison for punishment. The Roman jurisprudence long ago distinguished between the accused and the convicted, calling the former the *hostage of justice*, the latter the *slave of punishment*. It also distinguished between the places in which they were detained, naming the prison of the former, *carcer*; that of the latter, *vincula publica*; and distinctly declared that the *carcer* was to be regarded simply as a place for detaining men, keeping them safely, and not, like the *vincula publica*, for punishing them. The supreme conclusion from this argument is, that persons under a charge of crime, and while that charge remains still unproved, have a right to be protected from all danger of contamination by their fellow-prisoners, many of whom, no doubt, are guilty; and this protection can be had only through cellular separation. Even if the accused himself is willing, or indeed anxious, to forego this protection, society owes such guardianship to itself, for it cannot afford to have its members corrupted when it is in its power to prevent it. Another consequence flows from the argument; it is that, except the deprivation of liberty, nothing in these places of detention ought to be made to assume the aspect, the forms, the afflictive austerity of the prison. The accused ought to enjoy in them all the moral and material comforts that are consistent with their safe custody.

Permanency in the administration of county jails, as of all other prisons, I regard as a matter of the highest importance. To this end, where contiguous counties are small, or the population sparse, it might be well to have two or more counties unite in the maintenance of a jail. This would economize the expenditures, as well as facilitate the change suggested from an ever shifting to a permanent administration.

d. Next in the ascending series would come a class of institutions occupying a position between the county jail and the state prison. This kind of prison is not at present numerous in the United States, although, properly organized and conducted, it would be, in some respects, the most important of all, especially since, if multiplied to the extent it should be, it would be the most numerously peopled, and its occupants would be, for the most part, a class of criminals less steeped in crime than the population of the state prisons, and therefore more open to reformatory influences. The few that are now found among us are called by various names, but the designation which seems most fit, as best expressing their nature and design, is that of House of Correction. They would receive, for the most part, those misdemeanants who now have their punishment in the county jails, though with the criminal laws so changed that, after a first offense, which would still be punishable in the county jail, the sentences would be made long enough for genuine reformatory work to be wrought upon them. A number of these houses of correction, greater or less, according to territorial extent and population, would be needed in every State. They should be dispersed through the State, at points as convenient as possible to the several counties for whose use each is intended.

The advantages to be expected from the general establishment of this class of prisons are: 1. The organization of each with a full staff of

officers, and with all other appointments necessary for an effective performance of the work assigned them. 2. The arrangement of buildings, cells, workshops, school-rooms, chapels, and the entire premises, in a manner suited to a complete penitentiary system. 3. The introduction of a comprehensive, well-adjusted system of industrial labor. 4. Diminished cost of maintenance, despite the increase of officers—owing in part to the earnings of the prisoners, and in part to greater economy in the administration. 5. The relief of the common jails by the absence of a large proportion of their worst inmates and those returning most frequently, which would make the separate imprisonment of the rest comparatively easy, and might even enable several counties to unite their jails into one. 6. The relief of the State prisons by punishing in houses of correction the younger criminals, and perhaps some others, in whose cases extenuating circumstances may have appeared, and in reference to whom good hope may be entertained of benefit from the discipline of the house. 7. The crowning recommendation of the system lies in the reformatory character to be impressed upon it. This, indeed, is the great point to be sought through its establishment. But the complete and effective introduction of a reformatory discipline into any prison system makes exceedingly desirable, if it does not necessitate, the accompaniment of the Crofton intermediate prison. To avoid repetition, however, the treatment of this point will be postponed till the subject of state prisons comes to be considered, when some hints will be given touching the application of the principle to houses of correction.

e. Next and last in the series of establishments composing the prison system is the state prison proper—called in England convict, and on the continent central, prisons—the receptacle of criminals convicted of the gravest offenses against society and its laws, which are punishable by imprisonment, and not by death. It is here, as I conceive, that reforms the most material are needed. Even supposing the system, in its substratum, to remain unchanged, still important modifications are required to bring our state prisons into harmony with the true design of a penitentiary system, considered as an agency for reforming fallen men and women. A complete separation of their government from party politics; permanence in their executive administration; the employment of well-qualified officers; the abolishment of the contract system; the organization of convict labor on a principle which, in seeking to make the prisons self-supporting, will seek still more to make their industries an agency in reforming their inmates, and in restoring them to society masters of a trade that will enable them, on their discharge, to earn an honest living; a broader moral and scholastic instruction; a wider use of rewards to industry and good conduct, so that the principle of hope shall be made to act with greater vigor than that of fear; and the making of the reformation of the prisoners the real, as it is admitted to be the proper, aim of the discipline. Such are the essential reforms needed in the system, supposing it to continue, in other respects, what it is at present.

But I am not satisfied with the system as it is, nor should I be even with the reforms indicated in the last paragraph, for there are other reforms needed to give even to these their full vigor and efficiency. The fundamental reform required is, in my judgment, the introduction and efficient application of the principle of progressive classification, worked, in successive stages, on some well-considered mark system. Three stages would seem to be essential to the best and most effective working of this plan: the first strongly penal, to be undergone in

cellular separation; the second less penal, but still distinctly partaking of that character, yet becoming gradually less and less so, on the prisoner passing from class to class, as successive promotions are earned; while the third should retain but little of the penal character, being intended partly to test the reality of the reformation effected in the two preceding stages, and partly to train the prisoner for a time before his discharge, under conditions similar to those of ordinary free life, and so facilitate his re-absorption into the ranks of honest industry. This would place the prisoner's fate, during his incarceration, to a great extent, in his own hands. It would enable him, through industry and good conduct, to raise himself, step by step, to a position of increased freedom and privilege, while, on the contrary, idleness and disobedience would keep him in a state of coercion and restraint. This would place the springs of conduct within instead of without, and make him act from an inward impulse rather than from the application of any external force. It would effectually enlist his own will in the work of self-improvement, which I look upon as an essential condition of his reformation, for how is it possible to change a bad man into a good one against his own consent? Virtue is an outgrowth. It cannot be forced upon a man, but must spring from a germ planted within, to be developed and brought to perfection, by the assiduous care and nurture of the man himself; on this condition, and no other.

The system thus briefly sketched is, for substance, what has been heretofore known as the Irish, but is now generally, as of right it should be, called the Crofton system, from the name of its founder; and this last stage is his intermediate prison, so named because it holds a middle ground between an imprisonment strictly penal and an imprisonment differing but slightly from the condition of freedom complete and entire. It is essentially a probationary stage, its supreme aim being to *prove* the prisoner, and so to be enabled, if the trial turn out satisfactory, to give to an employer needing his services the requisite guarantee of industry and trustworthiness.

Here we touch the very heart and marrow of the question. The problem is, how to effect the re-absorption of reformed criminals into virtuous society? An army of convicts is every year discharged from prison. Society distrusts and refuses to employ them, thereby compelling a return to crime, and augmenting by its injustice the evil which it aims to cure by its punishments. How can its distrust be conquered, work secured to the convict, his salvation assured, and crime, as the resulting consequence, diminished? There are just two elements in the solution of this problem, and both, I think, essential—the reformation of the convict and a guarantee of his reformation that shall be satisfactory to the public. The reformation is to be effected by the processes—industrial, educational, and moral—to which he is subjected during his imprisonment. But the needed guarantee—how is that to be had? How is the moral cure of the prisoner to be *tested*? For a test there *must be*; it is indispensable. The discharged convict, though reformed and resolved to live honestly, fails to get work; and he fails so generally, that failure is the rule and success the exception. Why is this? It is not that society is hard-hearted; that it has no sympathy with misfortune; that it is vindictive and cruel; that it tramples upon a man merely because he is down. Far from it. But society has no confidence in the liberated prisoner; and, what is more to the purpose, it has no guarantee for its confidence. It is the want of a guarantee that builds a wall of granite between the released convict and honest bread. Conquer the distrust of society, replace it with confidence, furnish the re-

quired guarantee that the man is *trustworthy*, and all difficulty will vanish. Every shop, every factory, every farm, every avenue of honest toil will be open to his entrance. But the question is, how to abate the prejudice felt by society toward the liberated prisoner; how to overcome its dread of him; how to allay its fears; how to win for him its confidence and conciliate its regard? There is but one way to accomplish this result. The convict must furnish proof, during his imprisonment, that it is safe to trust him; safe to put him at the work-bench; safe to place in his hands "the shovel and the hoe;" safe to admit him to the fireside and the home-circle. In other words, his cure must be tested before he is discharged. But I do not see how this can be done where the system is one of material isolation to the end, nor any more how it can be done where the system is one of moral isolation to the end. There must be some field, some opportunity, for the trial. But such a theater, such a chance, can be afforded neither by the separate nor the associate system, as generally conducted. Both systems must be in part retained, in part discarded, in part changed. They must be so modified that the passage from imprisonment to freedom shall not be, as heretofore, by a single bound. The change must be so adjusted that the former shall gradually, almost imperceptibly, melt into the latter. The system must be such that the latter part of the imprisonment shall be little more than moral, in which, as far as may be, all the arrangements shall be those of ordinary life, with its trusts, its temptations, its motives, its responsibilities, its victories over self and sin, its silent toning up and strengthening of the whole character by the friction to which the man is, in these various ways, subjected.

Our state-prison systems should be so organized as to have connected with each prison, in one form or another, the substance of this intermediate establishment, this stage of comparative freedom and of natural training, which, at the same time, prepares the prisoner for full freedom, and tests his fitness for it.

But how can this stage be applied in the case of prisoners committed to the houses of correction? These would scarcely be large enough to warrant the establishment of an intermediate prison in connection with each. A single establishment of this kind would probably be sufficient for most States, but if the State were both large and populous, two or three might be necessary. The English convict establishments have not yet added the intermediate prison; nor does it exist in connection with the system of county and borough jails, either in England or Ireland. An eminent English philanthropist, Mr. Barwick Baker, is so impressed with the importance of the intermediate prison in connection with the English county and borough jail system, that he proposed, four years ago, a plan for making an experiment in that direction, and proffered his services to conduct the experiment himself. Mr. Baker is a gentleman of large wealth and high social position, as well as of great intellectual and business capacity, all of which are devoted, with incessant and tireless zeal, to the promotion of reforms in every department of social progress, but more especially to the work of juvenile reformation and the improvement of prison discipline. He established, I think, the first juvenile reformatory in England—certainly one of the first—and, at his own cost, conducted it for a number of years in person, and has maintained it ever since; his eldest son, upon whom the father's mantle appears to have fallen, acting at present as superintendent. Nor has he only been acquainted, for at least twenty years, with reformatory work, but for a still longer period he has been, as a magistrate and visiting justice, conversant with the management and character of adult

criminals. These facts are stated to show that it is not as a mere amateur, still less as a sciolist, that Mr. Baker speaks; but as a gentleman of large experience and calm judgment, whose opinions, on that account, are entitled to the highest respect. Mr. Baker commences the statement of his plan with a citation from a late report of the inspector of reformatories, in which that officer declares that, on the occurrence of certain changes which he recommends, a considerable number of these establishments might be given up. In that case, Mr. Baker says that he would propose to have the boys in his reformatory removed to others, and that the Home Office accept the buildings and land as an intermediate prison or house of correction. The secretary of state for the home department having full power to remove a prisoner from any one prison to any other, and to send him back at pleasure, Mr. Baker proposes that a few of the best men in the jails of his own and the neighboring counties be *allowed* to petition the secretary to remove them to the intermediate prison for such time only as their conduct proves to be satisfactory. Their petition should state that they had had the rules of the new prison read to them, and that they understood and agreed to the terms of their removal. If the secretary granted the petition, and the prisoner conformed to the rules and worked with earnest good-will on the farm, he would continue there for the remainder of his sentence; if otherwise, he would be sent back to the jail. Nor could he complain of this re-transfer as a hardship, since it would be but a return to his original sentence, to which he had made himself justly liable by a violation of the conditions on which his first transfer was granted. Those who remained through their whole term would then return to the kinds of work on which they had been lately employed, and to habits and a manner of life not unlike those which they left behind them. If a man's release occurred at a season of the year when employment was scarce, (a matter of much importance, if care be had for the diminution of crime,) he should be allowed to remain at the house till work could be found for him. So far, Mr. Baker says, no new legislation would be required. But if the system, on trial, proved a success, it would become necessary to secure the passage of an act authorizing the release of the prisoner on license, to earn his living under the watch of the police. Such license would not be a pardon, but simply a permission for a man to earn his own living during good behavior, revocable at any time for any kind of misconduct, even for being for any considerable time out of work, and so without visible means of support. The great objection to placing criminals in an intermediate prison without walls is that they would be likely to escape. To this Mr. Baker replies that he well remembers the time when the greatest pains were taken to search prisoners, even to the frequent unripping of their beds, to prevent the possible secreting of a nail with which the cell-door might be opened, or of a scrap of iron which could be sharpened into a knife. The safety of the jail was supposed principally to depend on this sort of care and watchfulness. But every prisoner now has a knife in his cell; yet escapes of violence are much less frequent than in those days. So Mr. Baker takes notice that twenty years ago, if it had been proposed to keep a number of boys imprisoned in a field with common hedges round it and public foot-paths running through it, the person so proposing would have been thought little short of a lunatic; yet this system has proved a decided success. Mr. Baker claims to have had, and certainly has had, large experience of men and boys, and he declares that he has no doubt that men would be far more easily restrained with-

out walls than boys have been, for the reason that they commonly act more upon reason and less on sudden impulse.

I have cited this proposition of Mr. Baker at some length, not because it is applicable, in all its phases and details, to the case in hand, but because it contains the judgment, on the general question, of a man of cool and cautious intellect and of a half century's observation, and more particularly because of the important opinion, expressed in the last sentence, as to the greater ease with which men, as compared with boys, might be held under restraint by moral forces.

§ 7. A paper of great value, on the "Capitalists of Crime," was submitted to the congress by Mr. Edwin Hill, who has for many years made the study of this subject a specialty. An analysis of this paper has already been given in the second part of the present report, which treats of the work of the congress. But the subject is one of so much importance, and to which so little attention has heretofore been given, that it seems to me worthy of still further elucidation, and especially that it should have a place in this chapter of "suggestions."

The contest between those who work and those who plunder is nearly as old as the world itself. Nor is there, I fear, much ground to hope for its speedy termination. It is worth while to inquire whether society has not made a mistake in its mode of carrying on this contest. Has it not failed to recognize the fact that habitual criminality is a craft, not carried on solely by isolated individuals, but by a virtual, if not a formal, organization, comprehending various grades and divisions of work, and requiring the combined action of capital and labor just as other crafts do, and being, like them, too, dependent for its continued existence on this union? There are two well-defined classes enlisted in criminal operations, the capitalists and the operatives, those who furnish the means and those who work the machinery; and the former are absolutely essential to the latter. The crime-capitalists include at least four classes: 1. The owners of houses and dens, affording to criminals habitations and places to which they may resort for carousal and low enjoyments. 2. The receivers or purchasers of stolen goods. 3. The pawnbrokers who lend money on such goods. 4. The makers of burglarious and other instruments used in criminal operations. It is, to a great extent, the practical impunity of these capitalists which supports the breed of thieves, burglars, and counterfeiters. As the law now stands, a man possessed of some capital may, with absolute impunity, use it in providing homes for criminals, arranged, if he so please, for concealing the thieves and their plunder, and for baffling the pursuit of the police; or he may, with equal impunity, engage in the manufacture of burglars', thieves', and counterfeiters' instruments, some of which are required to be of elaborate construction and workmanship. It is true that as regards those who cash the stolen property, either by purchase or by loan—receivers and pawnbrokers—the law does provide for their punishment; but the requirements as to evidence are such as to make detection and conviction, in ordinary cases, all but impossible. No doubt the criminal capitalists, compared to the swarms of operative plunderers, constitute but a small class. But being more sensitive to the terrors of the law, and more confined to given localities, they offer by far the fairest mark for criminal legislation. The mere operative of the criminal class has neither reputation to hazard nor property to lose; he can hide himself, or run away. Not so, however, the man who has invested his capital in aid of the predatory class. He cannot conceal himself; and if he abscond, he must leave his house, his shop, or his stock behind him. These crime-capitalists present a vital and an exceedingly vulnerable part of

the organization. If it were made absolutely unsafe for owners of property to afford shelter to habitual criminals—the stern rule, “no house-room to the dishonest,” being rigidly enforced—and if it were also made equally unsafe either to purchase stolen property or to advance money upon it, the class that now lives by plunder would be driven to honesty or starvation. Some years ago, in the town of Kidderminster, England, it was noticed that while more bulky articles were perfectly secure from depredation, the silk and thread used in bombazine and carpet weaving were constantly stolen. Now, what was the cause of this strange anomaly? Not, surely, that the people were honest for one thing and dishonest for another. But this was the reason: Kidderminster was not large enough to harbor a trader in stolen goods of the ordinary kind; but it contained many small weavers, some of whom had both means and inclination to buy the stolen silk and thread. Circumstances enabled capital and labor—the capital of the small weaver and the labor of the thief—to act jointly against the silk and thread, while they did not admit of such joint action against other kinds of property. There is a world of instruction in this. It says to society, Strike at the *crime-capitalist* in your warfare against crime; make the cities too hot to hold him; destroy opportunity in the large towns as well as in the small; and then evil inclination will remain dormant and undeveloped in the former no less than in the latter. But so long as, through ignorance or fear, you fail to adopt this method of attack, you will be obliged to maintain an army of policemen to check evil inclination as it ripens into crime; your property will be exposed to plunder and your persons to injury; and thousands upon thousands of children, who might have been saved, will be doomed to grow up under influences which will compel them, by a law as inexorable as that which makes the magnetic needle obey the lodestone, to become the criminal army of the future.

Now, of what has been said, this is the sum: To the spoliation of property, the united action of capital and labor is essential. Habitual criminality is sustained by an alliance between these two elements, each being alike indispensable to the prosecution of the business. The crime-capitalists are few; the operative plunderers many. The law strikes at the many operatives, one by one; it might and should strike at the few capitalists as a class. Let it direct its blows against the connection between capital and labor, ordinarily a beneficent one, but in this case evil, and only evil; nor forbear its assaults till it has wholly broken and dissolved the connection. When this baleful union shall be pierced in a vital part, it will perish. When the corner-stone of the leprous fabric shall be removed, the building itself will tumble into ruins.

§ 8. A large number of persons, in this country and in all countries, are every year arrested on suspicion and committed to prison, where they are confined for longer or shorter periods, varying from a day to a year, and even more, who, nevertheless, either on their first hearing or their trial, are acquitted by the magistrate or the court, and liberated as not guilty of the crimes charged against them. Yet, I am not aware that anywhere the persons so arrested, so imprisoned, and so adjudged to be innocent, receive any indemnity for the loss of time to which they have been, if not unjustly, at least without any fault of theirs, subjected. On this state of things, the question arises, Is not personal liberty a right as respectable as the right of property? And if this question is answered, as it must be, in the affirmative, a second instantly arises, viz, Is it not the plain duty of society to indemnify the innocent citizen, whom it has imprisoned, for the loss of time thus occasioned, as it indemnifies the citizen from whom it has taken his house or his field for some public use?

The right of indemnity, in this latter case, is not only fully recognized, but guarded with a jealous care. The state wants a part or the whole of my land for some great work, whose execution is demanded by the public good. Yet it can take possession only after various and solemn formalities. My right of ownership is guarded at every point and at every step; and I can be finally dispossessed only on receipt of full value for that of which I am deprived. I am found under circumstances which induce a suspicion, possibly a very slight one, that I have committed a criminal act. The state causes my arrest, and shuts me up in prison. It holds me there one month, six months, twelve months; and then, by the mouth of its chosen agents, solemnly declares that I am not guilty of the crime of which it had, or thought it had, reason to suspect me, and consequently lets me go free. That is all the state does. But is that the state's whole duty? Am I not as much entitled to indemnity in this case as in the other? The state thought I had done wrong, but was mistaken, and has made public and solemn declaration to that effect. Ought she not to repair the loss of time caused by her error? It is impossible for her to make good other and graver losses. "A man is accused, (I cite the words of an eminent French publicist, Mr. Mathieu;) some appearances are against him; and, though the presumption of innocence protects him, he is arrested; he is torn away from his home, his family, his affairs; disorder and trouble are introduced into all his relations; a deadly blow is given to his credit; and he is exposed to a ruin which he might ward off if he were at liberty, but which his imprisonment renders inevitable. Not only has this man suffered all the pains which have just been described; not only has he seen, without being able to apply a remedy, disorder and ruin invade his business, but it is in vain that an order of the judge, or even a decision of the tribunal, annuls his imprisonment and breaks his chains. The preliminary detention has marked him with an indelible stigma; the suspicion, in virtue of which justice has laid her hand upon him, follows him like his shadow, and his reputation will not be cured of the deadly wound it has received. Yet it is not the prisoner who is most to be pitied. How can we fail to turn our eyes toward his wife, his children, his family, though innocent, yet smitten with the same blow, ruined and disgraced like himself, without a fault that can be laid to their charge? Is this justice? Can society so crush the individual in the name of the general interest?"

Surely the principle of indemnity lies wrapped up, as the acorn holds the oak, in this eloquent denunciation; rather, let me say, this irrefragable logic. Not, indeed, complete indemnity, for money is not equal to that function, but indemnity for the time spent in prison. This principle is applied every day in similar cases. The witness and the jurymen, summoned from the work-bench or the counting-house to the courtroom, receive each a piece of money for the loss of time thus incurred. To one of them, who makes, perchance, his hundreds a day, it is but the symbol of justice, a token of the mutual relation between the citizen and the state; to the other, it is the daily bread of himself and his family. Can any reason be assigned why the same principle should not, nay, must not, be applied in the case of the man whom the judicial authority itself, speaking from the seat of justice, has declared to have been imprisoned and "held in durance vile" without adequate cause? Two incidental advantages, of no inconsiderable moment, additional to that of meeting a demand of justice, might be expected from the introduction of this principle into the administration of criminal law, viz, greater caution in making arrests, and more speedy trials after arrest.

Well and eloquently, in a paper on this subject prepared for the Cincinnati congress, has Mr. Corne said: "Man is not yet valued at his just price. The resources which he is capable of developing are far from having attained their maximum of force. Henceforth, without danger of being considered utopian, we may demand for him a portion of that respect with which mere property is surrounded. It is in this view that we claim that no prisoner, judicially recognized as innocent, shall be restored to his liberty without indemnity for the injury he has suffered as a consequence of his unjust imprisonment."

§ 9. The identification of prisoners who have been previously convicted, is a matter of the highest importance in the administration of criminal law; but, unfortunately, no well-devised plan for attaining this object with certainty exists, so far as I know, in any of the States of our Union. Hence the statistics of relapses and recommittals among us are vague and unreliable in the extreme; nothing could be in a more unsatisfactory state. Much use is made of photography in England and Ireland, and the same is true of several of the continental states. But the most perfect scheme for securing trustworthy knowledge on this point is the criminal registers (*casiers judiciaires*) devised by Mr. Bonneville de Marsangy, a French jurist of great eminence, who has lived to see the remarkable success of his invention in his own country, where it has been in use for some fifteen years or more, and its adoption in many others—Italy, Portugal, Denmark, &c. The first Napoleon, the greatest organizer of modern times, desired that his minister of justice should have always at hand "the biography of all malefactors;" a most natural wish, since of all the elements of a judgment as to the moral curability or incorrigibility of an offender, the most reliable is a knowledge of his past, and particularly as that past may have been connected with the administration of penal justice. This is precisely the knowledge which the criminal registers give concerning every man in France, who has ever felt himself within the grasp of the law. The registers are an administrative agency, with whose organization and workings, on my first visit to France, I was more desirous of becoming acquainted, from personal examination, than almost any other. Hence, learning that they were to be seen in the court-house (*palais de justice*) at Saint Omer, the first town I visited in France, that venerable structure received very early attention after my arrival. I found the *casier* to be an immense case, resembling a cupboard or closet, covering the whole side of a large apartment in the building, called the registry. The case contained rows of deep pigeon-holes, of which the number was equal to that of the letters of the alphabet. These compartments were filled with boxes or movable registers (*casiers mobiles*), arranged in alphabetical order, each containing the individual bulletins, or certificates of conviction, pronounced in any part of France against all persons born in that district, (*arrondissement*.) As soon as a sentence is pronounced by any tribunal (even though it be military or naval) the clerk of the district in which the prisoner has been convicted is obliged, on pain of a fine, to immediately address, signed by the attorney for the government, the certificate of his sentence to the registry of the district of which he is a native. Each certificate is on a single sheet, of a prescribed form and size, to facilitate the handling, and on strong paper to prevent its destruction. I examined, with lively interest, a great number of these certificates, giving the criminal history, so far as it is found in the records of courts, of prisoners convicted from one to twenty times—often in a half dozen or dozen different places. They fully met the demand of the author of the Code Napoleon for a complete criminal biography of every

man who had suffered the arrests of justice. Now there is just such a registry in every arrondissement or jurisdiction of France. There is, therefore, no longer any uncertainty possible in regard to the antecedents of any person charged with crime. A telegram, addressed to the register of his place of birth, immediately brings the statement that there is no record in his case, or a recapitulation of all the convictions previously had against him, no matter where, no matter when.

But suppose the accused to be of foreign birth, or to be ignorant of his birth-place, or to conceal it. M. de Marsangy has not forgotten or failed to provide for such contingencies. For these three classes he has caused to be established in Paris a central dépôt of certificates of conviction in the department of the minister of justice.

There are thus two centers of investigation. When the conviction of a person, arraigned before any tribunal in France, is found neither in the registry of his birthplace nor in that of the ministry of justice, M. de Marsangy regards it as an almost certain proof that he has never before been, in that country at least, under the hand of justice.

I will not stay to point out the many and great advantages which must accrue to a country in which such a system has been established and is efficiently administered. Whoever wishes to see them set forth with equal force and eloquence is referred to a paper furnished by their author to the penitentiary congress of Cincinnati, and published in its volume of transactions.*

The system of criminal registers, by the very simplicity of the principles which form its basis, is easily applicable to all countries. The four following measures constitute all the conditions precedent which are necessary to the establishment and successful working of the system in any state: 1. That a register of births be kept in duplicate copies, and that, every year, one of these duplicates be deposited in the registry of the tribunal of the district. 2. That each clerk of the court of the district have a case made, containing a certain number of compartments for the reception of the boxes or movable registers, (*casiers mobiles*,) arranged in alphabetical order, which are to serve as depositories of the individual certificates under each letter. 3. That the certificate of every conviction, wherever had, be immediately addressed to the tribunal of the convict's native district. 4. That every magistrate, prosecuting an offender, be required to obtain from the clerk of the district of which he is a native, and to attach to the proceedings in the case, the certificate recapitulating all prior convictions against him which may have been collected and classified in his native district.

A careful study of the most effective means of identifying accused prisoners previously convicted, and of the criminal registers, among other agencies having this end in view, is worthy of the best minds in our country, and especially of those who are called to make or execute the laws.

§ 10. Reference was made in the last section to the scantiness and untrustworthiness of penitentiary statistics in this country relating to relapses and recommitments. But the remark might receive a broader application. Indeed, the whole science of statistics, and more particularly as it relates to crime and criminal administration, is too little appreciated, and therefore too much neglected in the United States. We have no general, and especially no uniform, system of penitentiary statistics for the whole country. But such a system is a great desider-

*A copy of said transactions can be had, without charge, by applying to Dr. Wines, secretary National Prison Association, No. 320 Broadway, New York.

atum; it is, indeed, almost essential to broad and solid progress in this department of social progress. The laws of social phenomena can be ascertained only through the accumulation of facts. Returns of such facts, carefully gathered from a wide field of observation, and skillfully digested and tabulated, are indispensable to enable us to judge of the effect of any law or system which may have been put in operation. What we want to know is the facts; but a knowledge of the facts relating to so complex a subject as that of crime and criminal administration implies a mass of figures, collected from all quarters, and arranged with reference to some well-defined end. The local and the special are to little purpose here. It is the general only that has value; that is to say, returns so numerous, so manifold, and drawn from so wide a field and amid such diversified circumstances as to give real significance to the results. It is such returns alone that will yield inferences of practical value. We want to get an average; but in order to this, we must have scope and variety enough, both in the range and character of the returns, to be enabled to eliminate from them whatever is local and accidental, and to retain only what is general and permanent. Only on this condition can our conclusion as to what constitutes the essence of the matter be sound and safe. Only on this condition shall we be able to feel that our inferences rest, not upon mere incidents of the phenomena, which may be partial, casual, and immaterial; but upon the phenomena themselves, apart from variations which are only temporary or adventitious.

We wish to know, for example, whether the stern severity of the old system of prison discipline, or the benign pressure of the new, is the more successful in diminishing crime. How are we to decide this question? Obviously, our decision will have little force, unless our facts shall have been collected from a wide territory, and under a great diversity of conditions; so that every phase of the phenomena shall have been included in our returns, and all that is special and exceptional shall have been corrected, and a result reached, not neutralized or vitiated by any circumstances which have not been noted and due allowance made for them in the analysis. But the materials for a generalization having the breadth and trustworthiness here supposed are criminal and penitentiary statistics. A reformatory prison in one place may signally succeed, and in another as signally fail; yet the success of the one and the failure of the other may have little value as an argument, since they may have been due to accidental causes—the competency or incompetency of the head, for example—and they will, therefore, afford no ground for any general conclusion. But if the experiment of the new and milder discipline has been tried in a score of different places, and under conditions widely variant, and yet has always succeeded in securing a larger proportion of reformations than the old and more rigid system, except in a very few cases where the failure can be clearly traced to adventitious causes, such an induction will afford a solid basis for our inferences, and we shall feel that we stand upon a rock in affirming the proposition that kindness is more efficacious than severity in reforming prisoners and leading them back to the paths of virtue.

In proportion, therefore, as our facts are gathered from narrow districts and confined to short periods of time, our generalizations will be unsafe as a basis of argument, for we can never be sure that the mere accidents of the experiment may not have determined the character of the result. A practice founded on conclusions arrived at in this way, though scientific in form, would be empirical in fact; dogmatism

would have been mistaken for induction. Nor can this false reasoning be corrected otherwise than by returns which, if not universal, are at least general; that is, broadly comprehensive both of space and time. As we know crime to be occasionally local and epidemic, so, under certain conditions, may reformatations be; for what else are those mighty revivals of religion which have marked the history of the church in all ages? Results may be secured in one place and by one agency, which we may in vain seek to parallel in another place and by a different agency. If we would know what a curative agency applied to criminals can accomplish on the whole, we must know what it is effecting in the manufacturing towns and the rural villages, what in the sea-ports and the mountains and valleys of the interior, and what in the coal beds and the gold mines. We must learn its results, not in selected spots and under particular circumstances, but over broad regions and amid conditions endlessly varied. The essential, inwrought power of a system of prison discipline then comes out and makes itself manifest, when it is seen in conflict with the special obstacles it has to encounter in the agricultural, commercial, manufacturing, and mining populations of a country. The result of its struggle with all opposing forces is the result which alone is of any worth to us. And this can be known only as the facts are gathered from all these fields, and are collated, digested, and reduced to tabulated forms upon some uniform system, or at least in a way that will admit of practical comparison.

We want such statistics, uniform, full, and collected with regularity, year by year, from all the prisons and reformatories of the country. What do the American people know about American prisons? Something they know of the prisons of Charlestown, Sing Sing, and Philadelphia; but what information have they of the condition and progress of prison discipline in Oregon, Texas, and Arkansas? How many know the principle on which labor is organized, and the manner in which it is conducted in the penitentiaries of Nevada, Kansas, Alabama, and Georgia? Yet prison discipline is a mighty interest, touching profoundly the nation's well-being, and, as it succeeds or fails, involving its material interests to the extent of millions, aye, scores of millions every year. Is not prison discipline, then, a subject in which the people everywhere ought to be interested, and on which they need information, full, systematic, and regular? It is not in reference to a prison here, a reformatory there, and a truant home somewhere else, that they require to be informed; but they should have such information touching all the penal, reformatory, and preventive institutions of all the States; and then they would be able to judge whether the work of reforming criminals is really accomplished among us, or whether our penitentiary system is, so far forth, a mistake and a delusion. In the former case all we would need to do would be to "go on unto perfection;" in the latter it would be necessary to retrace our steps and take a "new departure."

It is not, however, simply in a national view that penitentiary statistics are valuable; they have an international importance as well. The Congress of London expressed very clearly its sense of this importance by the appointment of a permanent international commission, charged, among other functions, with the duty of devising, and, if possible, carrying into effect a scheme for a comprehensive system of international criminal and penitentiary statistics, based on common principles, employing common formulas, and arranged in such manner as to be a true measure and index of the crime, the penal administration, and the prison discipline of all civilized countries. The National Prison Association is the only organization in this country having a field of operations broad

enough, and at the same time the requisite machinery, to co-operate in so vast a work. The association is disposed to give special attention to an enterprise recommended by so respectable a body, and promising results of such signal utility, not to our own country alone, but to the whole human race. It is obvious, however, that the prosecution of such a work, where the very agencies through which it is to be effected will have to be created, will involve no inconsiderable expenditure of money, as well as an immense amount of labor. The labor it is willing to assume; the money must be supplied from without. Impressed with the importance, in a national point of view, of the end proposed, the association sought from Congress, at its last session, a grant of \$10,000 to enable it to pursue that end with the vigor requisite to its accomplishment. The Senate inserted in the annual deficiency bill the appropriation asked, but it was thrown out in the conference committee, and so failed. The application will be renewed at the next session, when better success may be anticipated. It was well understood by the London Congress, and the opinion freely expressed, that so great a design could be accomplished only through the generous co-operation of the governments of the whole civilized world, which, it was believed, would be readily accorded, in view of the beneficence as well as the vastness of the results to be expected. Mr. Beltrani-Scalia, of Italy, secretary of the commission, has prepared a complete series of formulas for recording the statistics sought; and the governments of various European countries have already given their adhesion to the plan, and promised co-operation. It is not to be supposed that the government of the United States will decline co-operation when it learns that other governments are lending their aid, and especially when it comes to understand the real nature and importance of the work, and an organization competent to its performance stands ready and is even anxious to undertake it.

§ 11. A system of prison discipline, to be really reformatory, must work *with* nature rather than *against* it. If we would improve men, whether *in* prison or *out* of it, we must not ignore, much less crush, those great principles which the Creator has, for wise purposes, impressed upon the human constitution. The principle of sociability, for instance, is one of the strongest instincts of the soul; one of the mightiest forces of human progress. Can we safely thrust it aside in our effort to reclaim and reform fallen men? Captain Maconochie's great experiment in prison discipline on Norfolk Island, with its great harvest of reformations of even the most hardened criminals, is well known. But he himself declares that his task was not really so difficult as it was thought, nor its results so wonderful as they appeared, for the reason that he was working with nature, not against her, as most other prison systems did. He sought to cherish, and at the same time to direct and regulate, those cravings for improved position which all men possess in some degree, and which are often strongest in those otherwise most debased. Under the guidance of right principle, he found that his men, most of whom were steeped in crime, rose easily to order and exertion. But this result was not accomplished by a system of pampering and weak indulgence. On the contrary, he held a steady hand, and his discipline was firm and energetic, though always just. He did not fail to inflict punishment when deserved; but he applied it within the limits assigned both by the letter and the spirit of the law, not by excesses of authority beyond it. The law imposed imprisonment and hard labor, and these he caused his men, in the fullest sense, to endure. Every one was required to perform, to the last stroke, his allotted task; but he was saved all needless humiliation, and was encouraged to look to his own steady

efforts for the amelioration of his lot and for ultimate liberation. And this, he modestly declares—not the efforts of an individual, however zealous—was the real secret of his success.

This principle of working *with* rather than *against* nature, in prison management, is in direct contradiction to existing systems of penitentiary discipline, and to the practice of most, happily not all, individual prisons. Coercion is, in most systems and prisons, the supreme force. The separate system is the most perfect form of coercion ever devised; men are utterly helpless in its grasp. But the silent system does not much differ from this. The silent, like the separate, system rests, in its last analysis, on the principle of isolation. The only difference is, that in the one case the isolation is accomplished by an absolute bodily separation; in the other, it is of a moral kind, being effected by the enforcement of an absolute and eternal silence. The principle of sociability has no more play under the one system than under the other. At least so far as theory goes it has not; for if the theoretical silent system were or could be practically enforced, which is impossible, men would work side by side for years, yes, for a life-time, without exchanging a thought by word, look, gesture, or any token whatever. Now all this constitutes a species of domestic slavery; and it sets such systems aside as ordinary agents of general reform. I do not deny that individual reformatations take place under them; but this is not so much through the system as in spite of it. Coercion is not a soil in which the tender plant of moral reform ever grew; or, at least, in which it can be ordinarily expected to grow. Such rough-riding over human nature is irreconcilable with every principle legitimately founded on its study.

Prisons should be made great workshops, or industrial establishments, where the inmates are systematically trained to be skillful, steady, sober, and *voluntarily* industrious; and where all the arrangements for labor are, at the same time, so like real life, as to be a natural preparation for it. The voluntary character of the labor cannot be too strongly insisted on. Compulsory labor—labor into which the will of the workman does not enter cordially—is, as a rule, rude, heedless, unskillful, and therefore unprofitable. It is free, and, still more, emulative or competitive labor that is earnest, ingenious, skillful, and productive. The economical improvement under such a system would be felt almost as soon as the moral; nor, indeed, can these ever be disjoined. No doubt it would require care and discretion, in the first instance, to organize such establishments. But the skill employed in their organization must be like that highest art which conceals art; and it must, above all, be content to sow good seed, and then wait, without forcing, the expected return. It would be easy to produce immediate results; but these would be ephemeral. Possibly the wisdom which is willing to wait can be gained only in the school of experience; but the test of renewed convictions after discharge would at length teach it effectually. When the lesson not to go too fast, to give a large scope to free agency, to let temptation assume all its customary forms, to regulate little but encourage much, is sufficiently learned, complete success may be hoped for in what should ever be the great aim of public punishment, the reformation of the fallen.

Much has been said of the demoralization and corruption resulting from the association of prisoners, especially with liberty of intercommunication. No doubt if, as on the usual principle of prison management, only their worst feelings are called out, and their intercourse is without guidance or control, the association of prisoners will be corrupting. But if their better impulses are brought into play—and Maconochie, Montesinos, Obermaier, Crofton, Sollohub, and Guillaume have shown that,

by proper combinations, this may be done without sacrificing any measure of just and reasonable punishment—prisoners will be found very much like other men.

It is argued that, however the association of prisoners with free persons might be advantageous to the former, that of prisoners with prisoners cannot but prove hurtful to them. But this is a gratuitous, and, in my opinion, wholly erroneous assumption. Every one knows that it is easier to influence men in a body than individually, and that, when once in motion, they will go further, since they mutually help one another by the common enthusiasm created by the union. Moreover, strange as the proposition sounds, there is a natural tendency in numbers toward right feeling. Witness the clap-traps of a theater, which are generally high moral sentiments. Witness the further fact, that the better feelings of a mob are rarely appealed to in vain. On the field of battle, the most heroic devotion, even to the sacrifice of life, is often called out at a word. In none of these instances, probably, could the same generous response be obtained from a single individual, which he renders, not only spontaneously, but enthusiastically, as one of a body. Captain Maconochie says that, on Norfolk Island, he could have done nothing with the prisoners separately; that the best of them would have remained only dogged under his exhortations; and that, in Birmingham, he would neither have gained the boys as he did, nor would they have been able to influence each other outside as they did, if they had been shut up in separate cells. The experience of Montesinos at Valencia, of Obermaier at Munich, of Crofton at Lusk, of Sollohub at Moscow, and of Guillaume at Neufchâtel, was, as we have seen, all of the same nature.

There is a reason of much cogency why greater prominence should be given to the social principle in our systems of prison discipline. Crime is essentially and intensely self-regarding, self-seeking, anti-social. Hence it is fostered by the selfish, and checked by the social, element of our nature. This fact is noted by Herbert Spencer in his Essay on Prison Ethics. He remarks: "The natural prompter of right conduct to others, and the natural opponent of misconduct to others, is sympathy; for out of sympathy grow both the kindly emotions, and that sentiment of justice which restrains us from aggression. Well, this sympathy, which makes society possible, is cultivated by social intercourse. By habitual participation in the pleasures of others, the faculty is strengthened; and whatever prevents this participation weakens it—an effect commonly illustrated in the selfishness of old bachelors. Hence we contend that shutting up prisoners within themselves, or forbidding all interchange of feeling, inevitably deadens such sympathies as they have, and so tends rather to diminish than to increase the moral check to transgression. Thus there is good reason to think that while silence and solitude may cow the spirit or undermine the energies, they cannot produce true reformation."

The principle is, that life within prison must be made as close a copy of life outside as may be, without sacrificing any of the just ends of public punishment. One of the most important parts of the machinery by which Captain Maconochie proposed to attain this object, was his mark system, which has been already partially explained. It will be recollected that his plan was to have labor sentences instead of time sentences—specific tasks to be measured by marks, and to be worked out by the prisoners. No supplies of any kind, whether of food, bedding, clothing—not even education—were to be given *gratuitously*; all were to be made exchangeable, at fixed rates, as the prisoner needed and was

willing to buy them, for marks previously earned ; with the distinct understanding, however, that only those which remained over and above all so exchanged, should count toward liberation. The prisoners, like free citizens, were thus made to depend, for every necessary and comfort, on their own industry and personal deserts ; while their prison offenses were restrained by fines to be paid in marks, just as those of persons outside are by fines in money or privation of liberty. Describing the practical working of his method, Captain Maconochie says :

“First, it gave me wages, and then fines. One gave me willing and progressively skilled laborers ; the other saved me from the necessity of imposing brutal and demoralizing punishments. My form of money next gave me school fees. I was most anxious to encourage education among my men, but, as I had refused them rations gratuitously, so I would not give them schooling either, but compelled them to yield marks to acquire it. I never saw any other adult schools make such rapid progress. My form of money next gave me bail bonds in cases of minor or even of great offenses ; a period of close imprisonment being often wholly or in part remitted in consideration of a sufficient number of other prisoners of good conduct becoming bound, under penalty of the forfeiture of a certain number of good marks, for the improved conduct of the culprit.”

Even in the establishment of a sick-club and a burial-club, Captain Maconochie applied the inflexible principle of “nothing for nothing”—that is to say, here, as throughout, he made the discipline of the prison as much like the discipline of Providence in free life as possible. He sought to make all his arrangements such that the prisoners would experience, through them, just such and so much of good or evil as naturally flowed from their conduct—a principle which he rightly declares to be the only true one. Now, what were the effects of a system made to conform, in so remarkable a degree, to the providential arrangements found in ordinary society ? The extreme debasement of the Norfolk Island convicts was notorious. They were the scum of all the penal colonies, sent to Norfolk because of their exceptional depravity. Yet reformations of these men were effected to an extent and of a character unknown, either before or since, in any of the penal colonies of the British Empire. This we must believe, unless all human testimony is to be discredited. How strong the attestation thus lent to the truth and force of the principle under consideration.

§ 12. In order to the best effect of a reformatory prison discipline, it should be divided into two distinct stages—the stage of punishment and the stage of reformation and training ; the former having in view the prisoner’s past, the latter his future. Both these processes, when the object is reform, are equally benevolent, because both are equally essential to the end in view. There can as little be true reform without true penitence, as there can be the growth of the man without the birth of the child. But the necessity for each is not, of itself, equally clear to criminals. Many who would, if possible, escape from restrictions as mere punishment, would willingly submit to them when understood to be a necessary antecedent of reform, and especially of release as conditioned upon reform ; for nothing is counted a hardship which tends to that issue. As a fever must be reduced before its ravages can be repaired, and as a wound must be probed and cleansed before it can be properly healed, so, in the moral cure of a criminal, a punishing stage must precede the reformatory stage. To do one thing at a time, and each well, is the rule in all nice operations ; and, surely, the recovery of a fellow-being from habits of crime to virtue, is worthy of an

equally methodical and careful procedure, and is not likely to be accomplished by one less scientific and delicate.

The necessity for separating these two processes may be placed in another light, and shown by a different argument. Subjection to punishment is an unnatural state, and interferes, necessarily, with that free agency, a sense of which is instinctive in man; whereas, on the contrary, a state of trial, of difficulty, of hardship even, supported by hope, and with its objects to be attained by voluntary exertion and self-denial, is a highly natural and improving state; it is the very state in which we are all sent into the world, and to which, accordingly, our faculties are especially accommodated. The two processes, therefore, cannot be combined, for either the restrictions involved in direct punishment destroy the free agency which is the essence of trial, or the concessions made to free agency weaken, if they do not destroy, the restrictions essential to punishment.

A testing stage should follow these two; but of that enough has been said in a former section.

§ 13. It belongs to the essence of a reformatory prison discipline to impart to the prisoner, during his detention, the power as well as the will to earn an honest living after his release. This can be done only by giving him, while he remains in prison, both the love and the habit of industry. Labor is at once a means of support and an auxiliary to virtue. It was a favorite maxim with Howard, "Make men diligent, and they will be honest." Work is the only sure basis of a reformatory discipline. "Unless prisoners acquire habits of industry and a liking for some kind of labor," says Mr. Frederic Hill in his admirable Treatise on Crime, "little hope can be entertained of their conduct after liberation." Good resolutions are well as far as they go; but, as a dependence for the future, unsupported by the habit of honest, useful toil, they will prove wholly fallacious. It will turn out with them as with sick-bed resolves, which usually vanish with returning health. Therefore, it is a matter of prime importance to impart to prisoners the knowledge of some regular business. The ranks of criminals are chiefly recruited from persons without fixed occupation, and especially from those who have never learned a trade. At least eighty per cent. of our imprisoned criminals belong to this class, which shows to what an extent the want of a trade becomes an occasion of crime. To teach a convict a trade is to place him above want, and that is more than half-way toward making him an honest man. A convict learning a trade is mastering the art of self-help. He feels that he is doing something for himself. As a consequence he is filled with hope; he is in better temper; his spirits are cheerful and buoyant. This feeling is itself a reformatory agency, and the man in whom it is found is much more likely to be morally improved by his incarceration than another in whom hope, alacrity, and cheerfulness have been extinguished. In one of his reports Mr. Rice states that of two hundred convicts discharged from the state prison of Maine, only seven had been reconvicted, and but two of these had learned a trade. Would it not be well, would it not be economical, to make less use of machinery in our prisons, and more use of the hands found there?

§ 14. Both religion and education are forces of vast potency within as well as without prison-walls. But their power and value are so well known, and have been so often and forcibly exhibited, that a mere reference is all that seems necessary in this report. Religion is the only power that is able to resist the irritation that saps the moral forces of these men of powerful impulses, whose neglect of its teachings has been the occasion of their being immured within prison-walls; while the

effect of education is to quicken intellect, give new ideas, supply food for thought, inspire self-respect, excite an honorable ambition, open new fields of exertion, and afford a healthful substitute for low and vicious amusements. What more need be said to show the value of these agencies in reforming criminals?

§ 15. All who would engage, with any hope of success, in the work of regenerating vicious and criminal humanity, must be animated by a hearty desire and intention to accomplish that result. Such a feeling and purpose, really entertained by all prison officials, would revolutionize prison management. It would change the whole spirit and tone of administration; and when that is done, the fit processes of a reformatory discipline will follow as a matter of course. It is not so much any specific apparatus that is needed, as it is the introduction of a really benevolent spirit into our prison work. It is the exercise of the Christian virtues as related to man that is wanted; and this, when exhibited under the control of principle and conscience, not of mere sentiment and impulse, is also the best manifestation of those virtues in their relation to God. Once let prison officers understand that their business is to *reform*—not merely to *punish*—their fellow-men, and let their desire and intention be conformed to that understanding, and they will speedily become inventive of the methods conducive to that end. Let the *principle* be established in theory and rooted in the heart of those who are to apply it, and suitable *processes* will follow, as naturally as the harvest follows the sowing.

§ 16. Equally essential is a serious conviction on the part of prison officers that prisoners are capable of being reformed. This belief is indispensable to success, for no man can heartily maintain a discipline at war with his inward beliefs. No man can earnestly strive to accomplish what in his heart he despairs of accomplishing. Doubt is an element of failure; confidence a guarantee of success. Nothing so weakens moral forces as unbelief; nothing so strengthens them as faith. "Be it unto thee according to thy faith," is not a mere theological dictum; it is equally the statement of a fundamental principle of success in all human undertakings, especially when our work lies within the realm of mind and morals.

§ 17. Greater prominence than heretofore should be given to moral forces, and less to mere physical power. A broad distinction must be made between physical apparatus and moral appliances in prison treatment. By physical apparatus is to be understood whatever is intended merely to coerce; by moral appliances, whatever offers a choice, and thus strengthens while it guides. The essential distinction is that between force and persuasion, between fettering the body and gaining the soul. The chief reliance, both for preventing crime and weaning from it, has been, and is, fear. Fear is no doubt among the most active passions and impulses of the soul. We all feel it, more or less, daily; and it ought, undoubtedly, to have a place in every system of crime-repression. Nevertheless, there is not an impulse of any kind—love, hatred, desire, hope, avarice—that does not continually overcome it, even in the most timid. Is it rational, then, in the effort to repress crime, to rest our chief confidence on the weaker rather than the stronger agencies, especially when it is considered that the promptings to crime usually proceed from the most powerful impulses of the human breast? There needs to be introduced into prison discipline a higher aim, a treatment of prisoners that seeks to gain the will, and not merely to coerce the body. What is wanted is, that they be trained to become virtuous freemen, and not merely that they be reduced, for a time, to the posi-

tion of well-ordered bondmen, taught the virtues of a state of slavery—obedience, submission, punctuality, order, and the like—but, of necessity, accompanied by a large admixture also of the vices of slavery—deceit, duplicity, evasion, latent but cherished resentment, and a thicker cloak of hypocrisy, which, however, only conceals, with more or less art, the continued rottenness within.

Criminals are too commonly considered the representatives of crime; and harshness toward them is thought to be a legitimate manifestation of our detestation of it. Should they not rather be looked upon as its first and saddest victims, to be pitied as well as blamed; to be pitied all the more for being bankrupt in virtue and character as well as in means? If we would earnestly seek to raise them from this state, not by weak and unwise indulgence, but by a judicious course of firm and even severe training, which would develop their manly and stimulate their moral nature, we should show a better understanding of the subject and of our duty in relation to it, and be much more successful in the great end of repressing crime. Only let us try; try in good faith and with good will; not halting between two opinions, but steadily and energetically acting upon one. The result would not long remain doubtful; and the greatest and gravest moral problem of our day would be at length satisfactorily solved.

All past systems of prison discipline have been, in the main, but modifications of *force*. Authority has been their chief, too often their exclusive, reliance. The result, so far as reforming criminals is concerned, has been failure. Let *organized persuasion* now have a trial; not coaxing, not pampering, not indulgence—a system as pernicious as it is false and feeble—but persuasion, with such forces behind it, resulting from a judicious application of motives, as, while leaving the will free, will yet, by a sort of moral necessity, determine it to a right choice.

The coercive system would seem to be an inherently and essentially vicious one, insomuch that precisely where it is most perfect, it will be found ultimately least successful. Mind can be gained only by appealing to mind. Fettering the body is even directly opposed to this. It has its immediate and apparent advantages; but they are too dearly purchased. If we will actively employ our prisoners, and by suitable means cultivate in them the daily practice of the manly and social virtues, they will protect themselves from degrading vices much better than we can protect them by walls and bolts; and the moral triumph thus achieved will be as improving and strengthening to them as the triumph won by physical force is humiliating and enfeebling.

Let me briefly indicate two or three of those moral forces whose use would be likely to be attended with the best results.

The ability of the prisoner to better his condition while in prison through his own exertions—in other words, a regulated self-interest—is one of the mightiest as well as the healthiest of these forces. Montesinos found this so in his prison at Valencia. He convinced himself that men in prison, as well as men outside, need the *stimulus* of some personal advantage to be derived from their exertions. He says that what no severity of punishment or constancy in applying it could force out of his men, a very moderate personal interest readily obtained. In different ways, therefore, he constantly applied this powerful stimulant, and the excellent results it yielded and the fruitful germs of reform developed by it convinced him at length that the most inefficacious of all methods in a prison and the most fatal to every chance of reform are punishments carried to the length of harshness. It was not, he

says, till after many trials of severity that he ultimately made the principle of encouragement and persuasion the basis of all his operations on the minds of the prisoners. He caused forty-three distinct trades to be taught in as many different workshops, and stimulated industry and skill by allowing the prisoners a large share in the product of their toil. The administration of Colonel Montesinos lasted fifteen years, and the results were: 1, ready submission, few punishments, and a high state of discipline; 2, the ability to dispense almost entirely with a paid staff by the substitution of the most intelligent of the reformed criminals as under-officers; 3, the complete self-support of the establishment, so that never a dollar was called for from the state; 4, the reduction of relapses from 40 per cent.—the average prior to his incumbency—to zero, not a single recommittal having taken place during the last three years of his administration, and an average of only one per cent. during the ten years preceding.

The cultivation of a feeling of self-respect in prisoners develops a moral force, of great potency in prison administration. Self-respect is one of the most powerful sentiments of the human mind, for the reason that it is the most intensely personal. Hence the maxim, "Do not further degrade in prison the man who has come to it already degraded by his crimes," should be constantly and carefully applied in prison treatment. No one will ever beneficially influence prisoners who does not seek to strengthen in their breasts the sentiment of manhood and personal dignity.

Moral power over prisoners may be attained through frequent, frank, kindly conversations with them—not too familiar, but judicious and self-respecting. This was an agency constantly employed by Maconochie, and he ascribes to it much of the influence that he gained over his men. He encouraged all to address him with freedom, and he would not even listen to a man unless he stood erect, looked him in the face, and spoke to him like a man. He used to say to them that he would rather have a man insolent than cringing. He encouraged all to speak freely to him, and to express, without reserve, their views and sentiments on whatever was the subject of conversation. By this means he was enabled to sound their impressions and the sources of them much more deeply than would otherwise have been possible. He made it a special object when thus conversing with a prisoner to interrogate him about his early youth and training, his parents, the lessons they had taught him, the example they had set him, &c. His design in this was to call up the associations of earlier days, and thus endeavor to revive in him the good impulses and principles which had guided his conduct before he became corrupted and seared by the scenes through which he had subsequently passed. In this way he obtained an immense power over his prisoners, which he skillfully and effectively applied as an agent in their reformation.

"The law of love and love in law"—in other words, kindness duly regulated—is a moral force of almost illimitable power. The kindness proposed is not, however, that which seeks merely to alleviate the immediate suffering of prisoners, which they have deserved and ought to undergo. It is rather a rational, prudent, forecasting kindness, which seeks to lift them up, to strengthen them, and to prepare them for the battle of life. Such a spirit universally introduced into our prisons would work wonders, both on the character of the prisoners and the movement of crime. This spirit once there, this aspiration after the moral improvement of their charge felt by the officers and recognized by them as a duty, would prove both inventive and creative in their hands. It would *find* or *make*

means to accomplish the reform of their prisoners, and when one agency proved abortive it would have recourse to others; *it would not be wholly balked*. Further, as we see in the case of M. Demetz and Mettray, such a spirit having once found a lodgment in the breast of prison officers, and constantly working itself out into action, would not long be confined within the prison walls, but would follow into society, after their discharge, those who had felt its beneficent power during their captivity, and would thus tend prodigiously to prevent relapses and, as a consequence, to diminish the volume of crime. What a change would the general possession and manifestation of this spirit produce in the tone and temper with which prisoners are treated! This is now too often supercilious, if not even contemptuous, whereas it should be rather that in which patients are received and treated in a hospital. Certainly the hatefulness of the crime committed should be freely expressed. On this head there should be no compromise. But apart from this, the criminal should be sincerely regarded and studiously treated as an object of compassion, fallen but recoverable, and sent to prison expressly to that end. A tone of hopefulness for his case should thus be maintained, and confidence felt and shown that, when put in the right way, he will be manly enough to abide in it. This idea of manliness and courage as belonging to virtue, and of abjectness and cowardice as inhering in vice, should be especially insisted on. The greatest benefit has resulted from it in dealing with rough and fallen natures. It is an idea that comes home to many men otherwise hard to be impressed, and to whom, on the other hand, any approach to whining or cant is distasteful, and becomes an object of scorn and scoffing.

It is important to note, in passing, that a liberal application of the law of kindness to prisoners is not incompatible with a calm, steady, resolute discipline. Tenderness may be fitly and successfully blended with justice in dealing with them. It is not a just rigor against which the prisoner rebels, for that may be as kind as it is wise; it is rather against capricious harshness, which is cruel and irritating for the very reason that it lacks the element of justice. Criminals are not much accustomed to kind treatment, and therefore they are the more touched by it. Convince them that you have a genuine sympathy, show them a kindness which evidently has its seat in the heart, and their sensibility is instantly awakened. This principle keeps a lingering hold upon our nature even in the last and lowest degree of human wickedness. When all other generous sensibilities are gone, this survives and shows itself even in the most hardened criminals. There is, somehow and somewhere, a soft part about them, which will give way before the demonstrations of a genuine tenderness and love. This one germ of a dormant virtue, this solitary element of an improved character, is found to outlive the destruction of all others; insomuch that, fallen as a brother may be from the moralities which once adorned him, the manifested good-will of his fellow-man still carries a charm and an influence along with it. There lies a regenerative and redemptive power just here, which no degradation can crush, no depravity extinguish.

§ 18. Individualization is an essential principle of a reformatory prison discipline. There was a general agreement in the congress on this point. It was held unanimously that, to insure the highest improvement of prisoners, prisoners must, to a certain extent, like the different members of a household, be treated individually. While all alike are placed under a general law, the conduct of each, as directed by it, should be specially and minutely noted. The improving effect of this would be found very great. It would be a first step toward restoring to

each that feeling of self-respect without which no recovery will ever be found permanent. Each should be enabled to know, if possible, from day to day, and certainly from week to week, the light in which his conduct is viewed, in all important particulars, by those placed over him; for thus alone, as his good purpose strengthens, will he be enabled to correct that wherein he may be found deficient. To this end a card might be hung in his cell, with four rows of figures constantly kept upon it. The first should indicate the prisoner's general conduct; the second his degree of industry and exertion; the third his attention and improvement, as noted by the chaplain; and the fourth the same, as shown by the schoolmaster's record. By this means, whenever the warden or chaplain, or any person entitled to make such perquisition, goes round, the whole conduct—and thence the character—of the individual would be instantly patent, and commendation, censure, caution, advice, or exhortation could be addressed to him as each might be needed. These marks would also form the basis of those estimations of character according to which prisoners would be passed through the different stages of treatment, rising successively from grade to grade, until, beginning at the lowest, they should have at length reached the highest.

It will be found important that rewards for exertion and improvement, other than physical comforts, be progressively added; or even that they should, at the discretion of the authorities, be substituted for such comforts. It is right and fair, and even improving, that consideration for the last should be used as a *stimulus* in the lower stages of reformatory treatment. Such, indeed, is the arrangement of Providence in human society, and we cannot copy a better type. But in proportion as the higher nature of the prisoner is developed and cultivated, higher objects of desire should be suggested and made similarly attainable, in order at once to keep the upward tendency active, and to raise the character of its aspirations. For this purpose a longer allowance of gas-light, a wider scope of books and instruction, and increased facilities of communication with families and respectable friends outside, and other like indulgences will be found powerful and most improving encouragements. At no stage, however, should any remission be made of the call for continued active exertion. To reward a prisoner, in any part of his course, by permitted idleness, is to undo the improvement that may have been already effected in him by dissociating the ideas of sustained effort and success, which should, as much as possible, be kept inseparably together in his mind. Even when partially sick, employment of some kind should, wherever practicable, be thus given him. The surgeon should be constantly invited to suggest such. Not infrequently this will even promote recovery—if not otherwise, yet by making a state of sickness not entirely a state of exemption.

§ 19. It is almost superfluous to remark that such a prison system and prison administration as that sketched, all too imperfectly and feebly, in the preceding sections of this concluding chapter, cannot be carried out in its true spirit, nor with the necessary intelligence and vigor, by the agents at present engaged in the work. We have, happily, even now, many heads of prisons, holding sound views, imbued with the right spirit, thoroughly competent to the duties of their position, and working with zeal and intelligence in fulfilment of their high mission. These have a few able and well-qualified assistants, who are animated by the same sentiments as themselves, and are lending to their aims and efforts a noble and efficient co-operation. But the mass of prison officials, throughout the country, are sadly deficient in the broad intelligence, good feeling, self-control, sound common sense, high moral principle,

strong religious feeling, and other essential qualifications requisite to their calling. It is idle to suppose that an equitable and humane—above all, a reformatory—prison code can be carried out successfully, where a fit administration cannot be had. To deal with delinquents, not by short and sharp methods, but through such pains-taking, cautious, and tardy processes as abstract justice indicates, and the attainment of genuine and permanent reformatory results imperatively demands, would require a class of agents which is yet, as a body, to be created. Nor, in my humble judgment, can such a creation ever be effected, except by special effort, special education, special training to that end. The reformation of fallen humanity is a work as complex, as delicate, as difficult, and demanding qualities and qualifications of intellect, judgment, and heart as high and as broad as any ever committed to the hand of man, and as worthy of being raised to the dignity of a regular calling or profession as any other within the wide range of human employment. If law, medicine, and divinity; if engineering, military command, and school-keeping; if sculpture, painting, and music; if even every handicraft requiring mere manual dexterity demand a special technical education and training in those who devote themselves to these callings, why not equally the work and calling of a prison keeper, whose proper business—the regeneration and redemption of fallen immortals, the cure of souls all sick and leprous with sin—is the peer of any of them in the dignity, grandeur, and beneficence of its aims. Mettray, with its glorious chief, who had the wisdom to establish his training-school even before he established his prison—Mettray, with its magnificent reformatory results, as the fruit and demonstration of that wisdom—is a living, visible, irrefragable argument in support of the value, the importance, the absolute necessity of a special preparation on the part of prison officers for their work. Let that argument, for present purposes, stand in the place of all others.

§ 20. The necessary complement of every prison system, which really aims to reform its subjects, is a comprehensive and efficient agency for the care of discharged prisoners. The moment of their liberation is, for them and for society, so far as they are concerned, a crisis whose gravity cannot easily be exaggerated. Their good intentions and their actual improvement in prison are then severely tested. The question is to be determined whether they will pursue the path of virtue, or return to crime. A few weeks, at most a few months, will, in all likelihood, decide the point. The trial is often one of terrible severity to the discharged convict. The temptations which surround him are strong and pressing. There is a fearful conflict in his soul. He wishes to do right, but is sorely urged to do wrong. He desires to stand, but trembles lest he should fall. He would do good, but evil is present with him. He starts at his own shadow. He feels that, like Cain, he is “a fugitive and a vagabond on the earth.” Terrible, indeed, are his struggles, for he has foes within as well as without to combat. His soul is driven to and fro between the frowns of the world and the upbraidings of conscience. These awaken remorse; those, despair. What does the released prisoner need in this, with him, supreme hour? First of all, sympathy, which will act like a cordial upon his bruised and fainting heart. Then he needs words of encouragement and hope, of wise and affectionate counsel, which will still further refresh and strengthen his spirits. He needs, moreover, pecuniary help. Some money or its equivalent he must have, or crime becomes a necessity. The best provision of this kind would be to allow him some share in his earnings as a prisoner, to be retained for him to the day of his liberation; but until such al-

lowance is accorded, which is equally the dictate of justice and policy, private benevolence, or, better still, the state, should extend some assistance of this sort, enough at least to enable him to "make a start in the world." But most of all, the discharged prisoner needs employment. At the earliest possible moment, therefore, he should be put in a position to help himself. Self-help is the best help he can have, for it gives independence, self-respect, and inward force. Sympathy, kind words, good advice, are all excellent in their place; but they are useless—worse than that, they are mockery—while you leave the man hungry and shivering, with nothing to do. But back your words with acts; give work as well as counsel; and then the words and the counsel have a mighty power; they become living forces.

Messrs. Haines and Howell, commissioners from the State of New Jersey to the Congress of London, in the report submitted by them to the governor of the State, have offered some excellent suggestions on this point. After citing the declaration of the congress that "the prisoner, on his discharge, should be systematically aided to obtain employment," the commissioners add:

"The truth of this sentiment has been frequently and painfully proved. Prisoners who, when discharged, gave evidence of thorough reformation, and who sincerely believed that they could keep their solemn resolution to live honestly, for want of employment and consequent poverty, and taunted, and sometimes threatened by those who knew of their conviction, have been driven to the haunts of vice and plunged again into crime. With the aid of some friendly hand to afford them suitable employment and means of self-support, many such might have become good citizens and contributors to the material wealth of the community.

"An agency for providing discharged prisoners with employment is a present and pressing necessity—one that is deeply and painfully felt. In some States this has been committed to individual effort and benevolent associations; but it is obviously the duty of the State, and properly devolving upon it. If the protection of society is to be secured by the imprisonment and reformation of the convict, surely that protection should be continued by such measures as will provide against a relapse into crime and a repetition of the former process of punishment.

"An officer of the prison, or what would be more effectual, an agent appointed for the purpose, charged with the duty of ascertaining the capacity of the prisoner, and securing for him suitable employment, would do much to promote the peace and safety of society, and secure many unhappy persons from temptation and repetition of crime, and aid in restoring them to the condition of useful citizens.

"If it be objected that the appointment of such an agent would increase the offices of the prison and the expenses of the State, it may be answered that such increased expense will prove to be the truest economy. The investment of the small sum for the salary and expenses of the agent would insure large profits to the State by saving the charges of reconviction and support of the prisoner, and by rendering him, who had been a burden, a contributor to the material property of the State.

"This is the financial and lowest point of consideration of the subject. If we regard the moral and social effects of such a measure, and compare the condition of one reconvicted, and his influence upon his family and the community, with that of one reformed and returned to the ranks of honest and productive industry, we can have no doubt of the propriety, the necessity, and the economy of such an office."

§ 21. So far, the "suggestions and recommendations" submitted by the undersigned have been of a general character. He ventures to add a par-

agraph more specific in its aim. The National Government has no prisons of its own. It has a criminal code and criminal courts. Men charged with criminal offenses are arraigned, tried, and convicted under its authority; but, when so convicted, it has no prisons to which it can send them for treatment. It is compelled to sentence them for punishment to the prisons of the States in which they happen to have had their trial; at least, such is the general practice. It has no control, no influence, over the discipline of the prisons to which they are committed. That discipline may be cruelly severe or unwisely lenient; it may make its subjects worse instead of better; it may send them out more depraved and hardened than when they entered, and more certain to continue their evil courses; but the government has not a word to say; it cannot lift a finger; it cannot exert a single counteracting force; it can only sit silent and let the work of corruption go on. Is this wise? Is it right? Is it statesmanship? Has the government no responsibility in regard to these men whom it has convicted of crime? Is their salvation a matter in which it has no concern, no interest, no duty? Is it not bound, in honor and conscience, to try to reform them and send them back to society regenerated in purpose and in life, with the will and the power to eat bread earned by honest toil? If it has any such duty in regard to these men, can the obligation be discharged by sending them it knows not whither; by committing them to it knows not whom; by subjecting them to a treatment which it has no power to control, and to influences in regard to which it does not even know whether they are good or bad, salutary or pernicious? General Coburn, chairman of the Military Committee of the House of Representatives, and General Logan, chairman of the Military Committee of the Senate, succeeded in getting an act passed by the last Congress providing for the establishment of a United States prison, in which prisoners tried and sentenced by military courts may receive the benefits of a humane and reformatory discipline; for so the act declares in express terms. Whatever reasons there may be for such a prison and the application of such a discipline in the case of military prisoners, there are many-fold more and more cogent reasons for such appliances in the case of persons convicted of crime in the civil courts of the United States, both because these latter are much more numerous and because they stand in much greater need of a reformatory treatment, their offenses being, for the most part, less against technical rules and more against law and morality, and springing, therefore, from a deeper moral taint. For these reasons, and others that might be adduced, the undersigned does not hesitate to "suggest and recommend" the immediate establishment of one prison, at least, for the treatment of persons convicted by the civil courts of the United States, and the addition of others as they may be found necessary or convenient, in which a discipline, based upon the principles set forth in this closing chapter of his report, may be honestly, intelligently, and faithfully applied.

All of which is respectfully submitted to the President:

NATIONAL BUREAU OF STANDARDS

REPORT OF THE NATIONAL BUREAU OF STANDARDS

E. C. WILSON, D. Sc.

1914

TRANSACTIONS.

I.—OPENING ADDRESSES—ORGANIZATION—STANDING COMMITTEES—ROLL OF MEMBERS.

The National Prison Reform Congress, called under the auspices of the National Prison Association of the United States, assembled at Masonic Temple, Baltimore, Maryland, at 8 o'clock, p. m., January 21, 1873.

The Hon. Horatio Seymour, of New York, president of the Association, took the chair in virtue of his office, and called the meeting to order.

On invitation of the president, prayer was offered by the Rev. Samuel J. Baird, D.D., of Virginia.

Governor Seymour then delivered the opening address, as follows:

GOVERNOR SEYMOUR'S ADDRESS.

The name of this association fails to give a full idea of its scope and aims. In terms, they seem to be limited to that class of men who have brought themselves under the penalties of the law. But the moment we begin to study the character of criminals and the causes of crime, we find that we are forced back to a scrutiny of our social system and of the weakness as well as the wickedness of our fellow-men. It is because the subjects of pauperism and crime thus lead to an analysis of human nature, and to the consideration of social aspects, that they have been made matters of profound thought by able publicists and large-minded statesmen. At first thought it seems that the condition of a small body of men, who have offended local laws, should be left to the thoughtful control of local authorities, but it is soon found that the considerations involved are as broad as the spread of the human race.

For these reasons, leading men of different nations were drawn together at the late International Convention, at London. For these reasons, this association was formed. Crime knows no geographical limits, no boundaries of states. It is, in its nature, at war with the welfare of the human race. It must be opposed by the united wisdom and virtue of all nationalities and of all forms of civilization.

While local laws must frame penal codes, and local societies do the work of lifting up fallen men, still much is gained by a wide-spread sympathy and co-operation. There are many things which are beyond the reach of state action, in a moral point of view; things which do not come under the cognizance of laws, but which deeply affect the welfare of our whole country.

At the first view, our efforts seem to be limited to the justice which punishes crime, and to the charity which tries to reform the criminal. But we are soon led into a wider field of duty. We are apt to look upon the inmates of prisons as exceptional men, unlike the mass of our people. We feel that they are thorns in the body politic, which should be drawn out and put where they will do no more harm. We regard

them as men who run counter to the currents of society, thus making disorder and mischief. These are errors. In truth, they are men who run with the currents of society, and who outrun them. They are men who, in a great degree, are moved and directed by the impulses around them; their characters are formed by the civilization in which they move. They are, in many respects, the representative men of a country. It is a hard thing to draw an indictment against a criminal which is not, in some respects, an indictment of the community in which he has lived. An intelligent stranger, who should visit the prisons of foreign countries and should hear the histories of their inmates, would get a better idea of the inner workings of their civilization than could be gained by intercourse with a like number of their citizens moving in the mere conventional circles of society. As a rule, wrong-doing is the growth of influences pervading the social system, as pestilences are bred by malarias. Our study into this subject soon teaches us that prisons are moral hospitals, where moral diseases are not only cared for, but science learns the moral laws of life; where it learns what endangers the general welfare of the community; what insidious pestilential vapors permeate society, carrying moral disease and death into its homes. Prisoners are men like ourselves; and if we would learn the dangers which lurk in our pathways, we must learn how they stumbled and fell. I do not doubt but some men are more prone to vice than others. But after listening to thousands of prayers for pardon, I can hardly recall a case where I did not feel that I might have fallen as my fellow-man has done, if I had been subjected to the same demoralizing influences and pressed by the same temptations. I repeat here what I have said on other occasions, that after a long experience with men in all conditions of life, after having felt, as much as most men, the harsh injustice springing from the strife and passions of the world, I have constantly learned to think more kindly of the hearts of men, and to think less of their heads.

If we find that crimes are, in a large degree, the hot-bed growth of social influences; if the weakness of human nature is always open to their attacks; if they may, at any time, enter into our homes and strike at the family circle, then we must at least guard against them as we do against the pestilence.

To protect the public health and to learn the laws of life, we build and sustain, with liberal hands, hospitals where the sick and wounded can be cured. The moral hospital should be regarded with an equal interest. In each of them we should seek to cure the inmates. In each of them we should seek to find out the secret causes of disease. With regard to both, we should always, in a large-minded way, feel that the laws of moral and physical life are a thousand times more important to the multitudes of the world at large than they are to the few inmates who languish within their gloomy walls.

The public hold in high honor the man of science who treads the walks of the hospital to relieve suffering, to find out the facts which will enable him to ward off sickness and death from others. This association appeals to the public for the same sympathy and support for those who labor to lift up their unhappy brethren from moral degradation, and at the same time to do the greater work of tracing out the springs and sources of crime, and of warning the public of its share of guilt in sowing the seeds of immorality by its tastes, maxims, and usages. We love to think that the inmates of cells are unlike ourselves. We would like to disown our common humanity with the downcast and depraved. We are apt to thank God that we are not like other men; but with closer study and deeper thought we find they are ourselves, under different

circumstances. And the circumstances that made them what they are abound in our civilization, and may, at any time, make others fall who do not dream of danger.

It is a mistake when we hold that criminals are merely perverse men, who are at war with social influences; on the other hand, they are the outgrowth of those influences. Crimes always take the hues and aspects of the country in which they are committed. They show not only guilty men, but a guilty people. The world deems those nations to be debased where crimes abound. It does not merely say that the laws are unwise, or that the judiciary is corrupt, but it charges the guilt home to the whole society. This is just; for most of the crimes which disgrace us could not be done if there was not an indifference to their causes on the part of the community. As certain plagues which sweep men into their graves cannot rage without foul air, so many crimes cannot prevail without wide-spread moral malaria. It is the greed for gold, the love of luxury in the American people, which have caused the legislative frauds, the municipal corruptions, the violations of trusts, which excite alarm in our land. It is the admiration of wealth, no matter how gained, which incites and emboldens the desperate speculator in commercial centers to sport with the sacred interests of labor, to unsettle the business of honest industry, by playing tricks with the standards of values. Those who use the stocks of great corporations as machines for gambling schemes, are more deliberately and artfully dishonest than the more humble swindler who throws his loaded dice. Many of the transactions of our capitalists are more hurtful to the welfare of our people than the acts of thieves and robbers. In the better days of American simplicity, honesty, and patriotism, these things could not have been done. No one would then have dared to face a people indignant at such rapacious greed. Such influences have led to frauds, defalcations, breaches of trust. They have filled our prisons and overwhelmed many households with shame and sorrow. Yet the authors of such things are honored for their wealth, and we ask, with eagerness, how rich do they get? and not, how do they get riches?

To make the public feel that criminals are men of like passions with ourselves, that crime is an infectious as well as a malignant disease, and that its sources are not so much personal inclination as general demoralization, are the great first steps toward reform. When we feel that disease may enter our own houses and seize upon the mental or moral weaknesses of those we love, we are ready to study its causes and its workings. We should then uphold and honor those men of humanity and true statesmanship who study out the causes of moral stains, as we honor and support those men of science who search out, in sick-rooms or hospitals, the causes and courses of the complaints which kill the body.

He who masters the diagnosis of crime gains a key to the mysteries of our nature and to the secret sources of demoralization, which opens to him a knowledge of the great principles of public and private reform, the true methods of a good administration of laws. Pauperism and crime have been made the subjects of earnest thought by the best and wisest men of the world, not only on account of their intrinsic interest, but also on account of their relationship to all other matters of good government. Neither of them can be driven out of existence; they will always be problems to vex statesmanship; but they must always be battled with. In the social edifice they are like fires, ever kindling in its different parts, which are to be kept under by watchfulness and care. If neglected, they burst out into the flames of anarchy and revolution, and sweep away forms of government.

These subjects must be studied directly and in their moral aspects. There is a pervading idea in our country that the spread of knowledge will check crime. No one values learning more than I do, but it is no specific for immorality and vice. Without moral and religious training, it frequently becomes an aid to crime. Science, mechanical skill, a knowledge of business affairs, even the refinements and accomplishments of life, are used by offenders against law. Knowledge fights on both sides in the battle between right and wrong, at this age. It lays siege to banks; it forces open vaults stronger than old castles; it forges and counterfeits. The most dangerous criminal is the educated, intellectual violator of the law, for he has all the resources of art at his command—the forces of mechanics, the subtleties of chemistry, the knowledge of man's ways and passions. Learning, by itself, only changes the aspect of immorality. Virtue is frequently found with the simple and uneducated, and vice with the educated. Surrounded by glittering objects within their reach, our servant girls resist more temptations than any class in society.

We must look beyond the accidents of knowledge or ignorance, if we wish to learn the springs of action. To check vice there must be high moral standards in the public mind. The American mind must move upon a higher plane. To reform convicts, their hopes must be aroused and their better instincts worked upon. I never yet found a man so untamable that there was not something of good on which to build a hope. I never yet found a man so good that he need not fear a fall. Through the warp and woof of the worst man's character there run some threads of gold, and in the best there are base materials. It is this web of entwined good and evil in men's character which make the problems and perplexities of the legislator and judge.

While there is no honest dealing with this subject unless the American people are charged with their share of guilt, and while Christian charity leads us to take the kindest view we can of every man, it does not follow that crime should be dealt with in a feeble way. Let the laws be swift, stern, and certain in their action. What they say, let them do; for certainty, more than severity, carries a dread of punishment. Let the ways of bringing offenders to justice be direct, clear, and untrammelled. The technicalities of pleading, proof, and proceedings, in many of our States, are painfully absurd. To the minds of most men, a criminal trial is a mysterious jumble. The public have no confidence that the worst criminal will be punished; the worst criminal cherishes, at all times, a hope of escape. In every part of our country there is a vague idea that certain men, of legal skill, can extricate offenders without regard to the merits of their case. This is a fruitful cause of crimes. There is not, in the minds of the American people, a clear, distinct conception of our penal laws, their actions, and their results. Not less hurtful to justice are those fluctuations of the public mind, which shakes off, spasmodically, its customary indifference; fiercely demands a conviction of those who happen, at such times, to be charged with crime; and thus makes popular clamor take the place of judicial calmness and impartiality.

No one feels that there is, in this country, a clear, strong, even flow of administration of criminal laws. The mood of the popular mind has too much to do with judicial proceedings.

The evils connected with the administration of justice in our land are due, in a good degree, to the swift changes in the material condition of our country. An increase of our numbers of more than a million each year, of more than twenty-five hundred each day, of more than one hun-

dred each hour, explains many of the causes of our overburdened system of penal laws, framed for a different state of society. Our perplexities are increased by the fact that more than one-quarter of this daily addition to our population is made up of those who come from other countries, strangers to our customs and laws, and, in many instances, ignorant of our language.

History gives no account of such vast increase of the numbers of any country by constant, peaceful accretion. Conquest rarely makes as many prisoners of war as we make captives to the peaceful advantages of our continent. They bring us wealth and power; they also bring us many problems to solve. British laws deal with British subjects. French courts decide upon the guilt or innocence of Frenchmen. Germany shapes, by its usages and customs, the ideas of right and wrong in the minds of the Teutonic races. But we, in America, have to deal with and act upon all nationalities, all phases of civilization. While these facts palliate the defects of our penal laws and of their administration, they certainly make more clear and urgent the duty which demands that we keep pace with the swift changes going on around us. More than this, our circumstances enable us to take the lead in the great work of reform, as we deal with more plastic materials than are found in the fixed condition of older nations. Here, too, we have a broader field, filled with men of varied phases and aspects of different civilizations, in which we can study the wants and weaknesses, the virtues and vices of the human race.

For a series of years, nearly three hundred thousand emigrants have been annually landed at the harbor of New York. Disorder and crime are always active along the line of march of great armies. I believe there is no instance in history of a movement of the human race so vast and long continued. I am glad to state a fact which in some degree palliates the disgrace which attaches to the administration of justice and the conduct of public affairs in that great city. But I should fall short of telling the whole truth if I did not also say that the discredit of that great city mainly springs from the sad fact that its men of wealth, as a body, lack that genuine self-respect which leads to a faithful, high-minded performance of the duties each citizen owes to the public.

Is there any other basis upon which we can found this great work of patriotism and philanthropy than the one contemplated by this association? It may, at first view, seem to be limited to a small class, but it opens up into a broad field of unpartisan, unsectarian labor. The objects we have in view, although they make our prisons their starting-point, are so wide in their bearings that they brought together, at the London international association, in the interests of our common humanity, men of the best minds, from most of the countries of Europe and America. These, in despite of their differences of creeds, usages, language, and form of civilization, could act in accord in devising measures to lift up the fallen, and to spread the principles of morality and justice among the peoples of the world. It is found that true statesmanship, like true religion, begins with visiting the prisoners and helping the poor.

It is certain that in our own country Edward Livingston, the public man who ranks highest in European regard for intellectual ability, gained his position by his great work, "The Penal Laws of Louisiana." When it was the fashion in the scientific world to hold that men and animals were dwarfed on this continent, this work was brought forward by our friends in Europe as a proof that statesmanship was full-grown here. It is a remarkable fact that an able foreign writer selected the Louisiana code and the proclamation of General Jackson against the

doctrine of secession as the two ablest productions of the American mind, not knowing that they both came from the same pen. An exposition of Mr. Livingston's system has lately been published in France, under the auspices of the French Institute, by M. Charles Lucas, a member of the Institute, and formerly president of the council of inspectors of the penal institutions of that country. M. Lucas is a distinguished writer and leader in the work of criminal reform. He belongs to that body of large-minded, philanthropic men who seek to benefit humanity by wise systems of legislation. A certain breadth and reach of mind mark all those men who have entered upon the study of penal laws and the reformation of criminals.

The Louisiana code is not only remarkable as the product of one man's mind—and I know of no like instance in history—but it is also distinguished by the fact that its republication is called for after the lapse of half a century. The new edition has an able introduction by Chief Justice Chase. Only fleeting honors are gained by those who deal with the passing phases of society, while enduring honors are won by those who grasp the lasting problems of government and laws. It is to be hoped that our statesmen will learn to follow in the higher pathways marked out by Mr. Livingston.

While there is much to condemn in our system of laws and their administration, there is much to admire in the practical workings of many of our prisons. In some respects we are in advance of other peoples. Much has been done in many of our States to improve the condition of criminals, and much more to rescue the young from courses of vice and destruction. I should be glad to speak of the instances of ability and self-devotion shown by men who have charge of public or private charities established for the reformation of offenders. They would lend a weight to my argument which my reasoning cannot give. But I must leave these things to be brought out by the discussions of this congress. I only seek to show the ends at which it aims. I only seek to invoke for it the sympathy and support of the public in its efforts to combine and organize the forces of those who, in different parts of our country, are working in this field of philanthropic and patriotic labor.

Crime has its origin in the passions which live in every breast and in the weaknesses which mark every character. In its nature it concerns each of us as clearly as the common liability to fall prematurely before disease and death. No man can know human nature, no man can be a great teacher to his fellow-men, no man can frame laws wisely and well, who has not studied character in convict life. There he can best see the lights and shadows of our nature; see in strongest contrasts what is good and what is bad.

The prisons, to which all vice tends, are the points from which the reforms can best be urged which seek to find out where vice begins. Starting from the sad ends of crime, and running back along their tracks, it is seen that in a large degree they are engendered by public tastes, habits, and demoralizations. It is in our prisons that we can best learn the corrupting influences about us which lead the weak as well as the wicked astray; ay, and sometimes make the strong man fall into disgrace and misery.

In these moral hospitals the thoughtful man, the philanthropist, and the statesman will look for the causes of social danger and demoralization. When we begin at the prison and work up, we find opening before us all the sources of crime; all the problems of social order and disorder; all the great questions with which statesmanship, in dealing with the

interests and welfare of a people, must cope when it seeks to lift up high standards of virtue and patriotism.

In the most highly civilized countries, the subjects of pauperism and crime secure the most attention and thought. They turn men's minds from selfish to unselfish fields of labor. Those who enter those fields will find in them marks of toil and care by the best human intellects. The grandest minds have worked at their intricate problems. The ambition of the first Napoleon sought to gain immortality in his code of laws as well as in victories on the field of battle.

Much has been done, in many of our States, to improve prison discipline. Something has been done toward reforming prisoners; but the larger view of the subject, which looks to the moral health of society and the baleful influences at work in its organization, has not received the attention which it deserves.

When prisons are visited by men of mind, when prisoners are looked upon with kindly eyes by those who can study their characters and learn from them the virtues, the vices, and the wickedness which mark our race, and who, tracing back the courses of their lives, shall find the secret sources of their errors and their crimes, then we shall have not only our laws justly enforced and reform wrong-doers; but, more and better than these, we shall gain a public virtue and intelligence which will secure the safety and happiness of our homes, the glory and stability of the republic. Then wealth gained by unworthy means will no longer be respected.

No one can recall the events of the past few years, particularly those of the great commercial centers, without feeling that there is an ebb-tide in American morals. Not a little of the glitter of our social and business life is the shining of putrescence. Fungous men have shot up into financial prominence, to whom a pervading, deadening moral malaria is the very breath of life. They could not exist without this, any more than certain poisonous plants can flourish without decaying vegetation.

While I have tried to present in clear terms the claims of this association upon the public sympathy and support, it must be understood that we claim for it only the merit of being a useful auxiliary to moral and religious teachings. If those who take part in its work should fall short of its broader, higher objects of a national character, they will at least get this great gain—they will learn to think more humbly of themselves, more kindly of their fellow-men, and to see more clearly the beauties of Christian charity.

MR. JONES'S ADDRESS.

The Hon. Isaac D. Jones, late attorney-general of Maryland, welcomed the members of the congress in the following remarks:

MR. PRESIDENT, MEMBERS OF THE NATIONAL PRISON ASSOCIATION, AND ALL WHO HAVE ASSEMBLED IN THIS CITY TO ATTEND THE PRISON REFORM CONGRESS: On behalf of the Prisoners' Aid Association of Maryland, and of all our citizens, I have been requested to extend to you the right hand of fellowship; to offer you, in their name, a cordial reception, and to bid you a most hearty Maryland welcome. This pleasant duty had been assigned, as was most fit, to our distinguished and eloquent fellow-citizen, his excellency the governor of Maryland. I am sure all will unite with me in regret that the condition of his health has deprived us of the honor of his presence, and *him* of the pleasure of meeting you on this occasion, as I am sure he would have done, with a most cor-

dial greeting. You need no assurance from me of his sympathy or of his readiness to render all the aid in his power in accomplishing the good work in which you are engaged. It is indeed a good work ; a great and important work ; a noble charity and Christian duty. The congress of representatives of many of the most important nations of the earth, which met in London in July last, indicated the deep interest which has been aroused throughout the civilized world in the success of this work. It involves one of the most difficult and yet vital problems connected with the administration of civil government. It grows in importance and extent the more you contemplate it. Beginning with those now in prison under condemnation and sentence, and considering what can be done toward impressing them with a proper sense of their crime, and the duty of repentance and reformation, and how, if possible, they may be restored to useful, honest citizenship ; then looking into the criminal code, and pondering its provisions and its administration in our courts and by our juries, and remedying, as far as possible, such defects in both as may be discovered, a far more extensive field is opened to the inquiry, what can and must be done to resist the swelling tide of crime, and to prevent its sweeping away the barriers which protect not only property, but the security of our homes, the quiet, peace, and safety of social life, and even life itself, and to induce all classes of our people to lead honest, industrious, sober, and useful lives ? It is too plain to observation and experience for any doubt, that the principal sources of this destructive flood of vice and misery are ignorance and idleness. What shall be the remedy for these ? Where and with whom shall we begin with the best prospect of success ? Undoubtedly with those who are young and as yet uncontaminated. And as to these, have all the experience of the ages and the boasted discoveries of modern science found out anything better than the good old proverb, "Train up a child in the way he should go ?"

And then comes the question, How and by whom shall he be trained ? What are the duties of parental training ; what the duty of the State in providing the most efficient system of education ? And, most important of all, upon what foundation shall the superstructure of education be erected ? I beg pardon for having, I fear, already gone beyond the limits assigned me. But as my heart is deeply impressed with the solemn importance of the subjects, at which I have merely hinted, I beg most respectfully, in this presence—where so many of the men of thought, men deservedly high in the public confidence, and in the councils of our country, are assembled—to declare my most solemn and profound conviction that any system of education which does not include the recognition of the existence and attributes of the God of the Bible, and of man's moral responsibility as an immortal being, will utterly fail to "train up a child in the way he should go ;" will utterly fail to impress the youthful mind with that reverence for truth, purity, justice, and right, and for the laws of God and of his country, which shall render him a good, law-abiding citizen.

And now, Mr. President, renewing the assurance of a most cordial welcome, permit me to express the hope that your stay with us may be pleasant, and that the deliberations of the prison congress may lead to the best results.

MR. KERR'S ADDRESS.

The Hon. Mr. Kerr, M. C., of Indiana, in responding to the welcoming address of Mr. Jones, said :

MR. PRESIDENT : When the executive of Indiana commissioned me as

a delegate to this body, he invited me to duties which I consider most honorable and important. My only regret is, that the exacting duties of service in another Congress compel me to decline their performance, beyond attendance upon this opening meeting.

The interest and safety of society demand, primarily, that crime shall be restrained and punished. There is no element in criminal administration that contributes so effectively to hold in check the criminally disposed as the *certainty* of punishment. Nothing tempts the wicked more strongly to the perpetration of crime than the hope of escape with impunity. It is, therefore, the obvious duty of every citizen to aid in whatever way he has opportunity to maintain and increase the *certainty* of the faithful execution of the law's judgments. Even an imperfect criminal law thus enforced will prove more salutary in its influence upon society than a good and wise law loosely, haltingly, or fitfully executed. I believe the experience of all countries and governments verifies these propositions. It results as our duty, that, in all our efforts to promote reforms in connection with the administration of criminal law, we should studiously avoid any policy that would tend to defeat the operation of these essential principles.

But while *certainty* of execution is essential to the success of criminal law and the protection of society, it is equally important that the just and impartial judgments of the law shall be executed upon the offender in the spirit of rational sympathy and mercy. The aim of all laws should be to punish and improve. Society has no right to enforce its punitive decrees with cruelty or torture. Such agencies do not tend to reform, but to humiliate, to enrage, to crush, to brutalize. If punishment alone be the object of the law, it cannot be best attained by such means. If you would sharpen the edge or intensify the sting of public punishment, you must cultivate the sensibilities, the conscience, the moral perceptions of your victim. The brutal man cannot suffer in any beneficial or reformatory sense. The state whose punitive policy tends to brutalize its offenders becomes itself an enemy of society in an important sense. In truth, civilized and Christian society should never cease to remember that, "'tis excellent to have a giant's strength, but tyrannous to use it like a giant." A brutalized convict, set free, is a worse man than before, and more disposed than ever to prey upon society; but if the offender be treated, during imprisonment, as a moral and rational creature, capable of being made better, a very different and much better result will follow. The temporary loss of personal liberty is exacted of the wrong-doer for the safety of society; but imprisonment cannot continue always. Therefore, even intelligent selfishness, as well as humanity, demands that, during confinement, the offender, if possible, be made a better man. In almost all cases this can be done.

The inherent enormity of crime ought never to be denied or palliated to the criminal, or reduced in the popular estimation, but rather magnified, as of necessity it will be just in proportion to the increased enlightenment of the individual and of the popular judgment and conscience. Yet it becomes legislators and prison officers to bear always in mind, that, in the evil antecedents and surroundings of birth, in the law of hereditary descent, in the misguiding influences of evil associations, of ignorance, of abject poverty, and of social neglect and ostracism, there are to be found many suggestions that should excite an earnest sympathy and a merciful forbearance. In subordination to the safety and purity of society the offender should have the full benefit of these suggestions. They appeal in his behalf to the best impulses of enlightened and just men. It is not improper or injurious in any way, nor

does it savor of undue sentimentalism to award to the criminal, in his prison treatment, the advantages which result from these considerations.

They forbid any system of treatment which does violence to obvious laws of health, or of healthful action of mind or body, within prison limits, or to the admitted laws of human improvement. A man diseased, or a man filled with dogged anger, or made morbid by solitary confinement, or wounded in his self-esteem by harsh or brutal treatment, is in a poor frame of mind to receive kindly, or to be impressed by, any formal instructions or admonitions. Indeed, under such circumstances, it is safe and logical to assume that all efforts for moral improvement of the convict are simply wasted. The great law of kindness, of humane interest and intelligent sympathy, can alone temper authority with instruction in such manner as to guarantee the best results. This is the constant experience of intelligent beings in all the relations of daily life. Why, then, shall not these benign principles be admitted within the prison walls? If improvement is to be the result of punishment, they may not, must not be excluded. If, indeed, the object of society is to transform our penitentiaries into moral pest-houses, and to add fuel to the base passions of their inmates, then eliminate these God-like and merciful principles, and leave cold, harsh, untempered, naked authority to rule and ruin. But it is not thus that the wise and good should desire, or can afford, to govern the bad. The primary object of all punitive discipline, after confinement at healthful, useful, and regular labor, should be the reformation of the criminal. This is required by the highest interests of society, by the dictates of the truest civilization, by the best teachings of religion, and by the unconscious appeals of the poor, ignorant, or stolidly wicked violators of law. The silent supplication of sinful and fallen humanity to its rulers is for light and strength, for education of the head and heart, for the cultivation of latent virtue, for the revival of neglected and abused manhood, and for the restoration of self-respect, to the end that, when the State shall bid the convict resume his personal liberty, he may also possess the morality, courage, and intelligence necessary for self-government. The intrinsic excellence of a system which secures these results in any substantial degree is above all comparison with any system of mere authority. It may be said that these results are not attainable in all cases. I admit it; but even the most desperate offenders are not insensible to the influences of kindness, justice, and good example. These elements, whenever illustrated in prison government by the officers, will surely command the respect of the inmates, however bad they may be, and will therefore certainly exercise a more reformatory influence than the policy of force, or fear, or the lash. I would not have these principles carried out in prison government from any mere maudlin or humanitarian sentiment of sympathy with criminals, the enemies of society and law, but rather out of a desire to promote the highest aims and noblest objects of both society and law. By such treatment of the bad I would increase the essential welfare and security of the good. Then such discipline of the wicked would react upon their associates in society, and become an additional aid in the prevention of crime.

Do you ask me what our country now most needs to give impetus and power to true and permanent penitentiary reform? I answer that, in my judgment, it is the organization of our prison governments in the persons of honest, practical, well-poised, cultivated, humane, and earnest men; not mere *doctrinaires* or dreamers, not devotees of peculiar systems or special crotchets; but practical men, men of affairs, of courage, of education, of a high grade of manhood, and of generous impulses as well as

incorruptible integrity. Here, then, is a new field and a good one, much neglected heretofore, for useful and beneficent civil-service reform. I hope you will, with emphasis, call the attention of our law makers and appointing powers throughout the States to its importance, and invoke their intelligent aid in its accomplishment. Bad or corrupt men, placed in control of convicts, speedily become worse themselves, and are quite powerless to improve others. The relation affords a severe test of character even in the best. Good and true and brave men alone should be given such a command. The influence of strong will, just character, and high moral tone in officers, is at once apparent upon the offenders. The latter are seldom so base as not to appreciate and respect such officers, and be beneficially influenced by their supervision, example, and instruction. The importance of having such officers cannot be overestimated.

Prison discipline, to be most effective and fruitful of good, should always have a discriminating relation to the antecedents, the personal qualities, the mental capacity, and the moral development of the individual offenders. Otherwise there will be little ground for hope of true and lasting reform. Therefore the law should require prison officers to be supplied with faithful reports of whatever is known touching the careers of convicts. Then officers will be enabled to make more judicious classifications, to apply discipline and instruction with intelligent reference to individual needs and conditions, and to protect prisoners from the evil results of unsuitable or improper associations. How indispensable it is for the attainment of all these good and worthy aims, that all prison officers be absolutely trustworthy and suitable men. If they are not, no amount of wisdom in the law makers, or in the mere letter of the statute, can accomplish the desired results. If they are, they will not fail to accomplish very great good even under imperfect and vicious laws, for they will be wiser and better than the statute, and, without violating it, they will obey the better impulses and requirements of enlightened humanity. The friends of prison reform may, therefore, do great good by earnest agitation in favor of the appointment of better and more suitable men for prison rulers.

It is most ungenerous trifling with the best interests of society and of unfortunate human beings to select prison officers from political or partisan motives. Personal fitness and qualifications alone should be the test. Party politics have no business in penitentiaries any more than in Sabbath-schools or insane asylums. They are bad enough in Congress. I don't mean this congress, but that more pretentious institution over at Washington. If you would establish a new claim, therefore, upon the public gratitude, see to it that politics be kept out of prison government. The higher motives and precepts of unselfish philanthropy and Christian charity should preside in such institutions.

MR. HAGEMAN'S REMARKS.

The president called on Mr. John F. Hageman, of New Jersey, for remarks, who said that he did not know why he had been thus distinguished, unless it was that he came from New Jersey, a State which executes her laws, and where there is no connivance between courts and juries, and where juries do not hesitate to convict when the facts warrant such a verdict. Yet, for all that, New Jersey believed in prison reform and a reformatory prison discipline, and was in full sympathy with the objects and work of this congress, and of the National Prison Association, at whose call it had been convened. He said that religious in-

struction and church services were employed with the best results in the prisons of his State. Industrial labor was also found a highly reformatory agency. He might be wrong, but he did not approve of the system of unbroken silence observed, theoretically at least, in most of the prisons. Talking did men a great deal of good. Outside workers, Christian men and women of judgment and piety, must be admitted, under proper restrictions, into our prisons; secular schools and Sunday-schools should be established in them. Our reformatory agencies must be enlarged and made more comprehensive.

APPOINTMENT OF COMMITTEES.

The following standing committees were then, on motion, appointed by the chair:

Committee on Permanent Organization.—Hon. P. T. Miller, of Missouri; Rev. T. K. Fessenden, of Connecticut; J. Merrefield, of Maryland; Colonel Burr, of Ohio; J. M. Talcott, of Rhode Island; Dr. Wright, of Tennessee; and Mr. Powell, of New York.

Business Committee.—Hon. C. I. Walker, of Michigan; Dr. Wines, of New York; Rev. A. Woodbury, of Rhode Island; Dr. E. W. Hatch, of Connecticut; G. S. Griffith, of Maryland; Samuel Allinson, of New Jersey; and H. Thane Miller, of Ohio.

Committee on Finance.—Murray Shipley, of Ohio; Hon. Edward Earle, of Massachusetts; John E. Develin, esq., of New York; W. R. Lincoln, of Maryland; Hon. G. W. Hall, of Pennsylvania; Hon. Frederick Smyth, of New Hampshire; and Hon. Cyrus Mendenhall, of Kentucky.

Committee on Credentials.—Wm. A. Wisong and J. H. Brown, of Maryland; and Rev. J. L. Milligan, of Pennsylvania.

ORGANIZATION OF THE CONGRESS.

The Committee on Permanent Organizations subsequently reported, and the congress was organized with the following officers:

President.—Hon. Horatio Seymour, New York.

Vice-Presidents.—Dr. E. W. Hatch, Connecticut; Charles E. Felton, Illinois; Hon. M. C. Kerr, Indiana; S. H. Craig, Iowa; Hon. K. F. Pritchard, Kentucky; G. S. Griffith, Maryland; Hon. Edward Earle, Massachusetts; Hon. C. I. Walker, Michigan; Professor W. F. Phelps, Minnesota; General B. B. Eggleston, Mississippi; General James L. Miner, Missouri; Hon. Frederick Smyth, New Hampshire; John F. Hageman, esq., New Jersey; H. W. Bellows, D. D., New York; Colonel Raymond Burr, Ohio; Hon. Richard Vaux, Pennsylvania; General N. Viall, Rhode Island; General C. J. Stolbrand, South Carolina; Dr. W. M. Wright, Tennessee; S. J. Baird, D. D., Virginia; Hon. Thomas Sweeney, West Virginia; Hon. Alexander Mitchell, Wisconsin; F. W. Howe, District of Columbia; A. P. Rockwood, Utah.

Secretaries.—H. A. Monfort, Ohio; Dr. J. C. Carpenter, District of Columbia; Rev. William Quinn, New York.

Treasurer.—Murray Shipley, Ohio.

Official Reporter.—Rev. Wm. H. Tiffany, New York.

ROLL OF MEMBERS.

The Committee on Credentials subsequently reported the following roll of members:

ALABAMA.—Not represented.

ARKANSAS.—Not represented.

CALIFORNIA.—Not represented.

CONNECTICUT.—Dr. E. W. Hatch, superintendent State reform school, West Meriden; David P. Nichols, president of board of trustees State reform school, Danbury; George Langdon, trustee State reform school, Plymouth; Hiram Foster, secretary of board of trustees State reform school, West Meriden; Rev. Geo. W. Wooding, chaplain of state prison, Wethersfield; Rev. I. H. Bradford, superintendent of girls' industrial reform school, Middletown; H. D. Smith, trustee of girls' industrial reform school, Plantsville; Rev. Thos. K. Fessenden, (executive appointment,) Farmington; Hon. Henry Barnard, Hartford.

DELAWARE.—Not represented.

FLORIDA.—Not represented.

GEORGIA.—Not represented.

ILLINOIS.—Charles E. Felton, superintendent of house of correction, Chicago.

INDIANA.—Hon. Michael C. Kerr, M. C., New Albany.

IOWA.—S. H. Craig, warden of state prison, Fort Madison.

KANSAS.—Not represented.

KENTUCKY.—Hon. K. F. Pritchard, (executive appointment,) Cattlesburg; Dr. J. F. South, (executive appointment,) Bowling Green; Hon. J. T. Gray, (executive appointment,) Louisville; Cyrus Mendenhall, Newport; Hon. R. K. White, manager of house of refuge, Louisville.

LOUISIANA.—Not represented.

MAINE.—Not represented.

MASSACHUSETTS.—Rev. Marcus Ames, superintendent of industrial school for girls, Lancaster; Hon. Edward L. Pierce, secretary of board of State charities, Boston; Hon. Edward Earle, member board of State charities, Worcester; Hon. Benj. Evans, superintendent State reform school, Westborough.

MARYLAND.—G. S. Griffith, president prisoners' aid society, Baltimore; Rev. Penford Doll, agent prisoners' aid society, Baltimore; Professor T. D. Baird, Samuel Townsend, Richard Janney, Chas. W. Slagle, J. Harman Brown, Wm. A. Wisong, Ira C. Canfield, Jos. Merrefield, members prisoners' aid society, Baltimore; Thos. S. Wilkinson, warden of penitentiary, Baltimore; Henry Seim, director of penitentiary board, Baltimore; R. V. Page, clerk of penitentiary board, Baltimore; J. H. Irvin, warden of city jail, Baltimore; A. W. Duke, visitor of city jail, Baltimore; W. R. Lincoln, superintendent of house of refuge, Baltimore; L. A. Byerly, director of house of refuge, Baltimore; J. S. Lincoln, superintendent of boys' home, Baltimore; William Palmer, agent of the Henry Watson children's aid society, Baltimore; Mrs. Penfield Doll, assistant agent of prisoners' aid society, Baltimore.

MISSISSIPPI.—General B. B. Eggleston.

MISSOURI.—General Jas. L. Miner, (executive appointment,) Jefferson City; Hon. P. T. Miller, (executive appointment,) Jefferson City; Miss Linda Gilbert, Saint Louis; Mrs. A. W. Richardson, Saint Louis.

MICHIGAN.—Hon. C. I. Walker, chairman board commissioners penal and charitable institutions, Detroit; Rev. Chas. Johnson, superintendent of reform school, Lansing; Hon. J. I. Mead, member of board of reform school, Lansing.

MINNESOTA.—Professor Wm. F. Phelps, president State normal school, Winona; Hon. E. G. Butts, inspector State prison, Stillwater; H. A. Jackman, warden State prison, Stillwater; Mrs. S. B. Jackman, Stillwater.

NEBRASKA.—Not represented.

NEVADA.—Not represented.

NEW HAMPSHIRE.—Hon. F. Smyth, ex-governor and president prisoners' aid association, Manchester; Allen Folger, member prisoners' aid association, Concord.

NEW JERSEY.—John F. Hageman, esq., district attorney, Princeton; L. H. Sheldon, superintendent State reform school, Jamesburg; Mrs. L. E. Dodge, matron of girls' industrial school, Trenton; Samuel Allinson, member of board of State reform and girls' industrial schools, Yardville.

NORTH CAROLINA.—Not represented.

NEW YORK.—Rev. Dr. H. W. Bellows, vice-president national prison association, New York; Rev. Dr. Wines, secretary national prison association, New York; Mrs. Wines; Rev. W. H. Tiffany, official reporter, Stony Creek; Aaron M. Powell, national temperance society and publication house, New York; Hon. John E. Develin, member board managers of Catholic protectory, New York; Rev. William Quinn, advisory chaplain of Catholic protectory, New York; Brother Teliow, rector of Catholic protectory, New York; George B. Cline, Roselyn.

OHIO.—Col. Raymond Burr, warden of penitentiary, Columbus; H. S. Monfort, superintendent of house of refuge, Cincinnati; H. Thane Miller, esq., director of house of refuge, Cincinnati; Murray Shipley, director of house of refuge, Cincinnati.

OREGON.—Not represented.

PENNSYLVANIA.—Hon. Richard Vaux, president of board of inspectors, eastern penitentiary, Philadelphia; George W. Hall, member of Philadelphia prison society, Philadelphia; Edward H. Coates, member of Philadelphia prison society, Philadelphia; Thomas A. Robinson, Philadelphia Magdalen society, Philadelphia; Dr. Joseph Parrish, president of association for the cure of inebriates, Media; T. J. Big- ham, president of reform school board, Pittsburgh; Rev. J. L. Milligan, chaplain of western penitentiary, Allegheny; George Albree, director of Allegheny County workhouse, Pittsburgh; J. D. Carlisle, Allegheny County prison society, Pittsburgh; Rev. W. A. Fuller, chaplain of Allegheny County workhouse, Claremont; J. P. Fleming, director Allegheny County workhouse, Pittsburgh; George R. White, director Allegheny County workhouse, Pittsburgh.

RHODE ISLAND.—General N. Viall, warden of state prison, Providence; Rev. Augustus Woodbury, president board of state prison inspectors, Providence; James M. Talcott, superintendent of reform school, Providence.

SOUTH CAROLINA.—General C. J. Stolbrand, warden of State prison, (executive appointment,) Columbia.

TENNESSEE.—Dr. W. M. Wright, inspector of state prison and branches, Nashville.

TEXAS.—Not represented.

VERMONT.—Not represented.

VIRGINIA.—Rev. Dr. S. J. Baird, Waynesborough.

WEST VIRGINIA.—Hon. Thomas Sweeney, Wheeling; Thomas P. Shallcross, warden of state prison, Moundsville.

WISCONSIN.—Not represented.

TERRITORIES.

DISTRICT OF COLUMBIA.—F. W. Howe, superintendent reform school, Washington; Dr. J. E. Carpenter, trustee of reform school, Washington.

UTAH.—A. P. Rockwood, warden of penitentiary, Salt Lake City.

FOREIGN COUNTRIES.

FINLAND.—Dr. Felix Heckle, Helingsfors.

II.—ANNUAL REPORTS OF SECRETARY AND STANDING COMMITTEES OF THE NATIONAL PRISON ASSOCIATION.

1. REPORT OF THE SECRETARY.

The undersigned respectfully offers for his second annual report as Secretary of the National Prison Association, the report which he had the honor to submit to the President of the United States as commissioner of the Government to the International Penitentiary Congress of London, and which is printed in the preceding part of the present volume.

E. C. WINES,
Secretary.

2. REPORT OF THE EXECUTIVE COMMITTEE.

The aim of the executive committee in the present report is to set before the national prison association and the people of the United States certain views relating to prison management, whose prevalence in society they deem of the highest importance—views which must take hold of the general public before any practical application of them will be allowed in our prison administration. These principles are doubtless familiar to the delegates to this congress, but not *too* familiar, and certainly not too *operative* even with them; and we know they will excuse some reiteration of commonplaces, for the sake of the end in view, which is the unfolding of those principles of human nature, in the light of which prison science can alone safely and steadily advance. We offer, then, nothing local, circumstantial, or historical; nothing specifically American; and nothing directly connected with the work of the past year, but only an unfolding of certain ideas and principles deemed vital to our cause.

Some twenty years ago Captain Alexander Maconochie, an English naval officer, and a man of exceptional insight into the laws of human nature, with a transcendent desire to aid its worst specimens to conquer their vices and weaknesses, conceived and carried out a scheme for the reform of prisoners and convicts, in the penal colony at Norfolk Island, Australia, and subsequently of the juvenile prisoners in Birmingham jail, England, which, although well known among students of prison discipline, is just beginning to attract the attention of the general public. Sir Walter Crofton adopted and improved upon Maconochie's suggestions, and inaugurated a similar system in Ireland, where it has become the admiration, example, and chief hope of all practical students of the new social science of prison discipline.

There was published, in the annual report of the association for 1871, a *résumé* of the principles of Maconochie's system, made by Dr. Wines, the learned, devoted, and persistent leader of American reformers in prison discipline. This admirable essay contains more to instruct and encourage the friends of criminals, and the hopes for an improved human society, than anything elsewhere to be found, excepting the original papers which furnished the ground-work of it. Before stating what those principles are, when traced to the root from which they spring, we wish to draw attention to a less usual view of the importance of the study of prison discipline, as a general study of human nature, reflecting immense light, not easily obtained by any other process, upon the whole science of education, domestic discipline, training for life, and even the administration of religion. Students in medicine know the vast importance of the opportunities afforded by public hospitals

for the study of the laws of health, and the conditions of cure in general practice. Morbid anatomy, too, throws valuable light upon the organs and functions of health. Insane asylums have become schools of study for psychologists; and the laws of reason and the discipline of intelligence and will are better understood by the careful study of abnormal fancies and deranged minds. In like manner, a profound consideration of the dispositions and tendencies that lead to crime, made in reformatories and prisons, reveals the errors of our domestic training, exhibits the prevalent faults of our school discipline, and throws a clear light on the defects of our social system. A study of the crude character, low tendencies, paralysis of will, morbid imagination, stupefied conscience, and gross sensuality of the criminal class, brought under prison restraint, opens a profound view into the working of our whole social system, points to the weak spots in our common nature, exhibits the defects in the laws and administration of our system of government, and shows how ill-formed is the public opinion that rules communities.

Without formally arraiguing society, or beating the air with complaints that have no definite end, in the attempt to remove difficulties connected with the condition of prisoners, principles are developed, rights brought out, and facts disclosed, which must inevitably, sooner or later, produce wide changes in the whole conception of this subject—changes which will prepare for radical reforms in general education, family discipline, and the whole life of society.

We do not propose to state Captain Maconochie's principles—which may now be considered the accepted principles of all competent dealers with the subject of prison discipline—in his own words, nor in the multiform division into which they fall in Dr. Wines's essay. We wish rather to strike at the root-principle of them all, and then to follow the trunk up to its few chief branches. We must keep principles and methods distinct, and it is a defect of Captain Maconochie's mind, and perhaps a necessity of Dr. Wines's purpose, that this is not done by either. The principles and the methods are both apparent enough in the account. But methods are constantly put in place of principles; and, indeed, Dr. Wines's title is a little misleading, and would be amended by calling his essay Maconochie's method of prison discipline. For instance, the mark or credit plan, which is his *first principle*, is really only a method founded on a principle. The principle is this, that hope is just as essentially and vitally at the root of all true prison discipline as at the root of all free human life. Extinguish *hope* in human society or in a single human bosom, and you strike a death-blow at the will, the conscience, and the understanding. Nothing so fatal in the action of government or in the political, social, economic conditions of a people, as the depression or extinction of hope. Governments and social organizations may be measured and graded, as regards their merits, by the degree in which hope exists among the people at large. It is the quality which exerts the largest, most constant, most stimulating and sustaining influence upon the one universal humanity. What light and heat are to the vegetable world, and what the opportunity is to plants to rise freely in the wooing air, hope is to human affections, faculties, and will. It is the absence of hope, indeed, which, more largely than anything else, makes criminals; for the immense obstacles which oppressive or unequal social and political institutions create to the following of honest paths of remunerative industry, drive the irresolute, the self-indulgent, and the less moral to what they mistake for the more open and immediately promising career of crime.

It being established that the old principle adopted from the entrance

to Dante's Inferno, "Let all who enter here abandon hope," which for ages had stood over the gate of the prison, is contrary to every law of human progress and elevation, Captain Maconochie, in effect, put in its place, "And now abideth hope" for prisoners and convicts, as well as for all God's creatures. This is really his fundamental principle, and it is worthy of its place at the root of his glorious scheme.

But in adopting this principle, of course the old idea of vindictive or even exemplary punishment, as the first end of penal law and practice, is at once torn from its supremacy. Of course, also, the immediate safety of free society being the sole object of criminal law, jails and prisons were originally built to disarm dangerous members of society of the power to harm it. Safely lodged there, they were to be punished vindictively for the injuries they had caused: first, because they deserved it, and justice was supposed to be thus promoted; and, second, to warn and deter others from following their example. It was at last discovered—and strange it is that it took so long to find it out—that the main object sought, the safety of free society, was not effectually secured by this method; that its cruelty and selfishness aroused a bitter hatred between the class most exposed to become criminals and society itself; that it made laws, and courts, and police merely objects of disgust and terror; took away the whole sense of anything friendly, protective, and in the interest of the exposed classes from the aspect of organized society and government, and really tended to create the criminals it punished. It was the crime-creating power of the gallows and of the vindictive punishments of jails and prisons, the dangers involved for society, and the little deterring power which fear was discovered to have over brutal natures, that first drew attention to the fact that, if only the interests of society were to be considered, the *reformation* of the convict must be placed first and made the ground-idea in his penal treatment. It was not a mawkish concern for him, nor chiefly a feeling of moral obligation to reform him, that first opened the way to the new principle, but a broader view of what the safety of society itself required. The safety of society demanded that law and justice should not present to the people of any country, as their first impression, that of a power inimical to, or distinct from, or merely restrictive of, their freedom. It should wear distinctively the aspect of a friend, well-wisher, helper. It should appear as much the protector, ally, inspirer and encourager of their industry, order, virtue, and happiness, as the restrainer of their violence and vice. "For their good always," should be its characteristic expression. Thus laws, police, courts, prisons, punishments, legislators, parliaments, presidents, and kings become the recognized friends and helpers of the people—sources of hope and refuge in trouble.

In this new state of things the criminal classes, offending against only just and mild restraints and laws universally conceded to be necessary and for the good of all, rapidly lose the sympathy of those nearest to them in condition and prospects. Then criminals cease to be heroes and martyrs; society ceases to be regarded as a tyrant, and penal law and police to be objects of the hatred and evasion of all the lower half of the social system. The necessity of reforming the convict for the safety of society having been adopted as a first principle of prison discipline, it soon became plain that *he could not be reformed except he were reformed for his own sake also*. In short, it became apparent that his own consent must be obtained, if not to his imprisonment, at least to his reformation, and that this could only be effected by carrying out toward men *in prison* precisely the principles adopted in keeping men *out of prison*. If the friendliness of the law be the principle which makes

free men most observant of laws and least disposed to break them, and so tends to diminish the criminal class, by what other principle shall those already become criminals and convicts be cured of criminal propensities and returned to society with the least danger to its safety?

Accordingly, the reformation of the prisoner being conceded to be the best and most necessary service to the public safety, and his reformation being impossible without his own free agency and consent, the problem was, how to secure this consent, and, as a consequence, his co-operation.

Captain Maconochie cannot have been the first to see that hope is the only sufficient motive that can be applied to secure this object; but he certainly was the first to feel that absolute confidence in it which was necessary to make it the cardinal working principle of a method of prison discipline. He said to himself, What is the fundamental principle that in free society stimulates the human race to order, industry, virtue, and piety? It is hope; hope of living; hope of influence and power; hope of ease in old age; hope of the esteem and love of those about us; hope of forgiveness; hope of heaven.

What is the ordinary form which this hope takes in respect of all social interests? It is wages or money, that roughly represents the reward, in view of which hope labors. Take away the hope of this reward from industry, character, talents, ingenuity, patience, persistency, self-control, and self-denial, and you strike away the crutch from the lame, and they fall to the ground. Now, how can hope be made in prisons just as operative a principle within the narrow limits of its sphere, as it is in common free life? Why, only by adopting in spirit the very idea of wages. It does not so much matter what these wages are, how large, or in what form; for among people whose very condition of imprisonment reduces them to a low plane of expectation, a very small inducement, steadily applied and gradually increased, produces as much effect as only a very large one does upon people in free life. A crack admitting the least light to a dungeon would be as precious to a convict as the whole dawn is to a free man. A penny a day to one who can otherwise earn nothing would be as influential as a shilling to those who find free occupation.

Set hope at work, and keep it at work, upon ever so low a grade; if it is working steadily and habitually, you have got your principle of motion and your fact of motion, and you can now direct the vessel because she is under way, whereas you could do nothing to guide her while she stood still. Captain Maconochie's method of setting this principle universally at work at the least cost to the state and the greatest good to the convict, which is also the greatest good of the nation, was to establish for prisoners a system of *marks*, each of which represented a value, say of one penny. The convict, instead of being condemned to a certain and fixed number of years of imprisonment, was to be condemned to remain in prison until he had earned and had put to his credit a certain number of *marks*—say 1,000, 2,000, 5,000, or 10,000, according to his crime; but it is to be noted that only the surplus of marks, after certain material deductions, could go toward his liberation. The marks in Captain Maconochie's system had a money value; and the prisoner was first to pay, in that currency, for his food, clothing, bed, schooling, &c.; and it was the surplus earned by him that alone counted toward his release. This made the prison an image of real life, and brought into play, and enlisted on the side of reformation, all the motives which act on men in free society as stimulants to industry, order, and good morals. His system goes still further, and

allows the prisoner, if he so elect, to remain after he has become entitled to his freedom, and earn marks the same as before. In that case the surplus of marks, after the payment above specified, have a real money value, and are paid to him in *hard cash* whenever he takes his departure from the prison.

Every one of his prison duties—good conduct, industry in labor, docility at school—could each day earn for him, let us say, at its maximum, three marks for each department, or nine in all. It is easily seen how he might lengthen out his imprisonment by disobedience, sloth, and indocility; how shorten it by good conduct, industry, and aptness at learning; and what a steady pressure hope would exercise upon him under such a system. But this mark system had other advantages. The discipline of the prison was arranged, and this is especially the case as applied in the Crofton system, so as to graduate the severity of the convict's condition according to his marks. First, for the opportunity of tasting the bitterness of his crime and reflecting upon his past folly, he was solitarily confined and put on a very low diet, it might be, for six months at its maximum and four at its minimum, and there was always before him the hope of shortening this fearful solitude and low fare by quietude, by observance of all prison rules, by docility to the chaplain and keeper. Then came labor out of his cell, a great relief; but at first labor only of the most distasteful or arduous kind, with a slightly improved diet, in which second stage the prisoner by good conduct, industry, and docility, could shorten also his term in this lowest of the improved stages by a few weeks or months, and then be promoted into a better class, whose privileges were slightly raised, by less supervision, more variety, better food; and this again, if faithfully used, gave place to a still freer prison life, with greater advantages and more attractions. Thus hope was always beckoning the convict on, supplying him with inducements to do his best, and giving him, as nearly as his condition allowed, the motives that stimulate free citizens to toil, decency, and self-improvement.

What branches this main principle divided into and gave support to, we shall now consider.

The admission of the fundamental principle of hope into prison-life, on the score of its being the chief inspiration of free or ordinary life, instantly suggests that the fundamental fact in dealing with all human beings is, that they partake a common human nature, and, "*mutatis mutandis*," that the same essential motives, rules, laws, conditions under which they flourish, in one set of circumstances, are applicable to all. The essential conditions of growth, progress, reformation, are not changed by the most diverse circumstances. The wildest tribe of Indians falls under the laws of human nature as well as the most cultivated nations of the Saxon race; and progress, order, safety, industry, self-respect depend in both upon the same principles. It is not in essence, but simply in form, that the principles of action are changed. A prison is not so unlike the world outside its walls that the presence of men and women there do not make it more similar to free society in its wants and conditions of usefulness than its restraints and isolation make it different from such society. The world, under Divine Providence, is, in some sort, a prison; and the prison is, in some sort, a world. There is confinement, restraint, bondage in the free world; and there is freedom, opportunity, variety in the closest prison. You cannot free the most fortunate and unrestrained citizen from many restrictive rules and circumstances, and you cannot rob the chained convict of his freedom of thought and his excursions of

feeling and fancy. Indeed, freedom, in proportion to its political completeness, has its moral restrictions and its self-restraints intensified. Under the highest civilization, man, in becoming a law to himself, is attended by the most vigilant of police officers and the most implacable of task masters. There is no prison so impassible as that with which the obligations of duty surround the tender conscience, or the laws of reason the active intelligence, or the requirements of the affections the largest and most liberal heart. Those who fancy that free society, in proportion to its freedom, encourages or admits license, caprice, self-will, mistake the nature of the most operative restraints in the human soul. In the freest society, education, enlightenment, cultivated sensibility, conscientiousness, aspiration, piety, not only take the place of police supervision and criminal law, but they do their work a thousand times more rigidly and effectively.

But taking free society in its present average state, no mistake is wilder and more betraying than that which supposes its usual restraints and penalties to be light and inoperative. The restraints it imposes, the penalties it exacts, the burdens it lays on the backs of its children, are infinitely greater, more general, and more constant than statutory law can inflict. Burke says: "The laws reach but a very little way. Constitute government how you please, infinitely the greater part of it must depend on the exercise of the powers which are left at large, to the prudence and uprightness of ministers of state." And we may add all artificial restraints and contrivances, social or political, fall immeasurably short in their efficiency of those natural, self-enforcing penalties, restraints, and incitements which come from the very constitution of our nature and the world we live in. What motive could take the place of hunger, sympathy, paternal instinct, the love of power, the dread of pain, the fear of death, the hope of heaven? What device could fulfill the guardian-angelship of natural modesty and divine shame? What restrain like the natural sense of justice, the natural desire for the good opinion of others, and the natural dread of consequences? Our constitution, the laws of our physical, intellectual, moral, social nature are the tremendous barriers which our Maker has opposed to license and disobedience. We are in prison to them—a prison we may break, but never without penalty. They set a prison guard about us more vigilant and with more fatal weapons than can surround a jail full of murderers. The criminal laws of man, few, loose, inapt, bungling, uncertain, easily evaded, are directed mainly to the restraint of exceptionally low and vulgar natures; to the prevention of the evils that are least common, and which furnish no temptation to average humanity. But the laws of nature and the self-developing and self-acting laws of human society, are absolute in their strength and efficacy. They provoke little opposition and no sense of injustice. They are impartial and they are sleepless. But in the severity, constancy, and even penal character of those laws, we discover how it is God that governs the world.

If we would improve our laws, our schools, our homes, ourselves, we must follow God's method; leave natural principles undisturbed, fall back on the essential motive powers; keep hope always at work, and fling every member of society to the utmost extent possible, consistent with safety to the rest, upon an enlightened sense of his own interest, on the rewards that attend and follow obedience to justice, truth, and duty, and the stimulus that proceeds from that hope which perfectly equal laws, political and personal freedom, and an encouraging faith in God's goodness and in the benignity of religion, do so much to promote.

The most constant of the laws of Providence, in free society, is the *necessity of labor*; and it is the most benignant and most educational and disciplinary of all human necessities. Whatever theory of its origin we may adopt, we have no conception of any possible growth of humanity separated from the use and working of its faculties, and we have no experience of any adequate use of those faculties except under the steady spur of necessity. Labor, which alone regulates the restless love of liberty, the uncivilizing change of place, the native indolence of man in most climates, is provided for by the constant pressure of hunger—a want which is only greater than that of clothing—which is itself perhaps the more directly civilizing necessity, as it is less sensual than the want of food. All the other wants of society are modifications, developments, and refinements of these, shelter being only another sort of clothing, and architecture another form of shelter. The sense of property and its rights, and the public opinion which guards them better than law, are natural outgrowths of the value which labor puts upon its own conscious pains. But labor is animated not only by necessity, but by the discovery of its rewards, and the cumulative and ever-increasing preciousness of its results, as more of the powers of humanity and especially its higher faculties are mingled with it. There is no essential difference between the pains of thinking and the strain of the muscles; between work, whether considered as mental or physical. Both are induced and sustained by the same essential stimulus. As human nature refines its wants, the motive changes its form, but not its spirit, accordingly. The hunger for luxury may become as eager as that for food; the thirst for influence, fame, virtue, excellence, as imperative as that for shelter. Man's nature cannot be developed without its wants becoming ever more varied and more urgent, but the principle is always the same. What we want, we must labor to get; and it is only by labor that we can make even our gratifications satisfying. Thus protectors may furnish food, but what but labor in some form can furnish appetite? You may supply the indolent with books, but what but his own laborious self-cultivation can supply the skill to read, the taste to enjoy, the mental discipline to understand them? You may surround a prince with statues and pictures, but can anything short of the laborious cultivation of his knowledge and taste give him the power to enjoy them? Wealth, inherited, has few of the satisfactions of wealth created. Position, born-to, has none of the charms of position won. Plenty bestowed has none of the sweetness of plenty earned. It is impossible, in short, by any circumstances to overcome the necessity of developing, by labor, those feelings, tastes, habits, that condition of the man himself which is the other and more important factor in the felicitating result which is aimed at. This would be more universally conceded if labor were not so commonly regarded purely in its lower, more common, and more external forms.

But while man, in free society, has a providential necessity for labor, which can never be set aside or outwitted without penalties, he has also an instinct for freedom, a dread of labor, a desire to change its form, to escape its outward signs, and to get above its visible necessities. Those who lack this feeling become drudges or drones. Those who have it in excess impress the labor of others and become tyrants by force of will, genius, or strength. Make labor a double necessity, first of hunger and then of artificial compulsion, and you make serfs and slaves. Enact unjust laws, or perpetuate by law the injustice, greed, and ambition of earlier society—allow the land to pass into few hands—continue a feudal state of things—and you degrade the bulk of any na-

tion into mere day-laborers, whose aspirations and hopes are limited to their daily bread. But just in proportion as political institutions are equal and just, you offer to all men under their bland influence the highest balance of a general necessity for labor, with the greatest inducement to the cultivation and use of their best faculties, that their labor may be refined and rewarded in higher ways, according as their powers and aptitudes may allow. But let none think that Providence ceases to exact the strictest payments for its gifts in the shape of toil, self-control, and the highest and most painful self-culture, from those who seem to escape most completely from the ordinary necessities of humanity. Genius is a fearful taskmaster. Power is a prodigious worker. Elevation is often solitary confinement, and the vaster the sway and the mightier the forces controlled, the stiffer the hands that hold the reins and the more weary and worn the charioteer. In a word, labor as a necessity—now physical, now mental—permanently describes human condition in free society; and freedom in the discharge of this necessity is merely the change of the necessity from the belly to the will. The more free you can make this labor, by taking it off the back and putting it upon the brain—the more you can bring its compulsion out of the heart, conscience, taste, intellect, and the less out of the stomach—the more do you make it favorable to human dignity and aspiration. Political freedom, free trade, common-school education, religious bearing, immortal hopes, equal laws, protection of property and rights, all aid in, and are measured off by, this result. Men must work with hand, or head, or heart. Get their free consent to this work by making them feel its blessedness as a law of Providence, and not merely a blunt necessity of fortuitous circumstances, a misfortune of their lot; let them see that so they are built up and dignified, and so society is exalted, that the God who made them is their friend as well as their prison keeper and governor, and that all things in His providence and our nature work together for good, if we observe His statutes and laws written in that nature and our lot, and you achieve the highest possible results of social existence, as well as secure the largest returns of individual happiness and excellency.

It is these principles which the new science of prison discipline, based on Maconochie's method, is seeking to apply to the treatment and elevation of prisoners. Hope being the root of the principle, labor and freedom are its two chief branches. The prisoner must be kept at labor, because labor is the great burden and necessity of all free life, and its chief educating opportunity. Solitary confinement, deprivation of occupation, beyond a very limited period, in the way of punishment, at the outset of the convict's imprisonment, are found wholly lacking in any power to renovate and reform. They do afford an opportunity for reflection, and they humble and break down the prisoner's false pride and sense of power to defy the law. But the very feelings thus usefully started are paralyzed, if not put to a speedy use; and a dungeon or cell becomes, after a while, a place of sleep, apathy, idle thoughts, or prurient fancies. Besides, the prisoner who is fed at the public cost, usually quite as abundantly or more so than people at liberty in his own social class are fed by their labor, often feels that he is compelling society to support him, and successfully evading the law that, in the sweat of his brow, he shall earn his bread. Keep him for years in this idleness, and he goes out of jail utterly ruined as a laborer, and often speedily returns to prison, sometimes by an act purposely committed to secure that end. A life of full-fed idleness in prison is sweeter to degraded natures than a life of ill-paid and ill-fed labor out of it. As soon, therefore, as the

convict has passed through his short season of solitary confinement, he is put to hard labor, on poor diet; but, with the feeling that he is now earning his own bread, he returns in part to the ordinary wholesome state of free life. But his labor is soon made less bitter, if it is not made sweet, by the announcement that he can slightly improve his fare by diligence, co-operation, quiet behavior, and the careful observance of all prison rules. A few months of the least attractive form of labor, if the prisoner earns the privilege by good conduct, are rewarded by a choice of occupations. He is put to the trade for which he has an aptitude or preference. Now, again, his diet is bettered.

By degrees the social nature, which is so important a part of man, and so educating and invigorating, is allowed to take its part in his elevation. The prisoners are separated into small squads, and permitted to carry on their work together, to help each other, and finally even to live together in huts or cabins, always, of course, under necessary restrictions and supervision, but with a steady eye to imitating, as far as possible, the workings of free society, accustoming them to social influence and to membership one of another. As much room as is compatible with security and their safe-keeping is given to their free will. They are continually encouraged to work from inward motives, from a sense of benefit to themselves, from hope of reward, and from a consciousness that both their labor and their indulgences are regulated with an eye to their personal reformation and their preparation for future self-support in the ways of order and virtue.

But what has become of punishment under this hopeful system of reformation? Is not the sense of confinement, the necessary association with convicts, the brand of the public prison, isolation from the world, and the suspension of the freedom to go and come, and do and not do, which belong to the innocent, punishment enough? But that is not the true answer; the severity of punishment is in no degree to be measured by its external amount or its cruelty of form, but by the degree in which it is felt. If you kill sensibility you destroy the power of suffering. You may whip a prisoner till he ceases to feel the blows. You may extinguish the sense of freedom until the prison ceases to be an object of horror or offense. You may dull the conscience until no appeal starts a responsive pang. You may accustom man to hardship until hardship ceases to have any sense of trial connected with it. The true method of making punishment effective is to make the object of it sensitive to its stroke. You must not toughen either the outer cuticle or the true skin of the heart, if you expect your blow upon either to tell. A gentleman feels a slight imputation on his honor more than a ruffian does a stab. A breath of calumny afflicts an innocent and modest woman more than a public trial does a lewd sister. Even then, if punishment is to be made dreadful, it is only within the boundaries of two principles that it can keep its efficacy. You must not extinguish or lessen sensibility by the hardening process of frequent, persistent, and cruel penalties. To make a soldier familiar with the lash is to destroy its dread. To make a prisoner familiar with solitude, with hunger, with stolid neglect, with dull routine, is to destroy or annul their penal influence, their deterring power, their chastening or their moral influence.

All punishments the world can render
Serve only to provoke th' offender;
The will gains strength from treatment horrid,
As hides grow harder when they are curried.

—*Trumbull's McFingal.*

Punishment is not lessened in its power by external mildness, by careful graduation, by considerate and infrequent application. Even suffering, which it must be recollected is at last a personal feeling, is not morally diminished by any process which increases sensibility faster than it diminishes violence. The probability is that it is the best and most improving prisoners, those who have the most privileges and the nearest approach to free life, who feel their sufferings and their punishment most acutely. For they still have the love of liberty, the elements of self-respect, and the consciousness of power to be good citizens tugging at their heart-strings. They have the reproaches of conscience, the memory of an innocence they have lost, the longing for an opportunity to try their good resolutions, all intensified by the shame of their situation. Brutal, hardened, self-abandoned men, accustomed to daily severity, hopeless, and without interest in themselves or their future, are not great sufferers; they are fast becoming insensible stocks and stones.

It is a radical error, then, to assume that making more of the reformatory aim makes less of the penal. That is really *more* when put in the *second* place, than it could be if left in the first. Do you suppose that a prisoner of average sensibility feels most a blow, or a word of reproof and exhortation, of kindness and sympathy? Many whom stripes cannot touch are deeply moved to suffering by a sympathy new to their hearts, which opens the closed flood-gates of remorse.

The new processes of milder and more reformatory methods are not designed to make the prisoner dread the jail less or feel more comfortable there, nor do they have that effect. They are designed to bring the more sensitive parts of his nature under the influence of punishment, and to make that punishment elevating and reformatory, instead of being merely degrading and brutalizing. You may flog a boy until his hands are too tough to suffer, yet he has sensibility still left somewhere on his skin. You may apply severe punishments only in one way, and with so much routine and narrowness of application that they lose all responsiveness from the nature they aim to reach. The *more* of the man you can keep open and exposed, the more of thought, feeling, conscience, affection, hope, you bring under your penal application, the larger and more effective is your weapon; therefore, whatever free-will, whatever freedom of action, whatever education, whatever moral influence, whatever affection, whatever else tends to increase the area and sensibility of the criminal's humanity, offer you new chances of punishment with new chances of reformation.

It is with the convict under cruel, or brutal, or persistent penalties as it is with society under oppressive and intrusive or vindictive laws. To make shop-lifting a hanging offense does not tend to diminish crimes of violence. "As well be hung for a sheep as a lamb," says the thief; one crime is as bad as another. Thus moral distinctions are blurred, the wisdom and justice of society are arraigned, and the lower portion of the world becomes insensible to the moral considerations most potent over the beginnings of vice and crime. If you make vexatious and intrusive tariff laws, and affix unreasonable duties, you harden the mercantile conscience, and convert even the better class of women into petty smugglers. Few laws, mild laws, impartial laws make sensitive citizens, enlist the good will of the public, favor their own certain enforcement, and bring into play those private forces of personal self-control and conscientiousness which are the chief and final hope of order and justice.

Prisoners are men; criminals are men; jails are in and a part of the social system; and the identical principles, and as near an approach as

possible to the methods of ordinary life, are both more penal and more reformatory than any others. It is found that the rules of sick-rooms in private homes are the best rules for public hospitals; of course they cannot there be carried out in perfection, but they must be reached forward to with all pains. So the insane are now governed as nearly as possible by reason, and as much as possible like the sane. The old plan was to forget that insanity is a disease of sanity, just as the old medical practice forgot that bodily disease was the disturbance of forces which in equilibrium we call health, and that the laws of health, and not the laws of disease, are the great foundation of true therapeutics. Until crime is regarded as a disease of society, that must be cured on social principles, and in accordance with social laws; until criminals are considered as belonging to the human species, and still mainly to be governed and cured by universal human motives and human sensibilities, we shall not have reached the very key to the whole problem.

For the committee :

H. W. BELLOWS.

3. REPORT OF THE STANDING COMMITTEE ON PRISON DISCIPLINE.

Prison discipline, as a subject of inquiry by this committee, includes the exposed classes in society and the criminals. The former are the friendless poor, the uneducated, the immigrant population, and those who are born into such surroundings as drunkenness, license, fraud, &c., or who unfortunately inherit, in their constitutions, imbecility, vicious impulses, or nervous disease. The latter are those who, having committed crime, are either in prison or at large. The best information to be had warrants the estimate of 40,000 as the number of actually imprisoned criminals in the United States at a given time. There are no reliable data on which to found a statement of the percentage of criminals who evade commitment to prison. But there is no doubt that a large proportion do. If it were supposable that the objective causes of criminal acts, and the causes that tend to repress crime and contribute to the reformation of criminals, were about evenly balanced, we might hope that this proportion, whatever it be, comprised the criminals of the country, a fact sufficiently alarming, whether viewed in its financial relations or as a source of danger to life and property. But, doubtless, the influence of the criminals at large upon their progeny, upon their associates, and upon society in various ways, is in excess of the governmental and moral means for repression, and no general reformatory results are reached with those who are imprisoned; and since about one-third of these latter are annually released from prison, the prison population itself becomes a center of crime-production.

A numerical estimate of the classes especially exposed to commit crime can scarcely be made with sufficient accuracy to give it much value; and since this report proposes to treat chiefly of the criminals themselves, it will not be attempted. It is safe to affirm, however, that there is a migratory population, without accumulated means and with few social ties, who earn irregularly and spend prodigally; that there are others who are penniless and improvident, though having a fixed domicile; and that there is a large class who, from one cause or another, depend on public or private charity. There are others still, whose occupation and associations serve to develop the baser passions at the sacrifice of the benevolent affections and moral sentiments, though possessed of sufficient pecuniary resources. These several classes constitute, altogether, an uneducated mass of beings, with some virtues doubt-

less, but nevertheless specially exposed to temptations. So there are hundreds of thousands fresh from foreign countries, possessing but imperfect knowledge of our language, our laws, and our social customs, strangers in a strange land, the prey of political partisans and unprincipled sharpers, who are crowded into the cities or pushed out upon the frontiers of civilization, and wholly unaccustomed to the freedom which they enjoy here, many of whom are likely to infringe upon the rights of property and person, and to offend against the peace and order of society. And also, beyond question, there is a large class, possessing the unfortunate inheritance of deficient mental and moral faculties, with ungovernable animal instincts or diseased nervous conditions, rendering their proper behavior, in mixed society, a practical impossibility, without the restraints of the law.

We have, then, as the subject of our inquiries—1. Some 40,000 criminals actually in custody; 2. An unknown quantity of the same class abroad in the community; and, 3. An indefinitely large population peculiarly exposed to crimes.

Prison discipline, in the broad sense, has to do with the exposed classes by way of introducing and conducting special preventive agencies, and in this work we seem to be limited at present to investigation and recommendation, for the people are so jealous of any apparent infringement of individual rights that they are impatient of the restraints and obligations necessary to this end. But good progress has been made of late through the enactment of compulsory education and stringent liquor-laws in some States, and, though these laws are very imperfectly enforced, they show a degree of attention to prevention and an improved sentiment which are very encouraging.

The State of Michigan follows Massachusetts in the next practical measure, and promises to improve upon the Munson establishment in the last named State. There is now in progress of construction by Michigan, at Coldwater, a State public school, embodying the main features of both the family and the congregate ideas, as separately applied throughout the country in its reform schools or houses of refuge. The establishment will comprise ten cottages for families of thirty each, with suitable buildings for meals, for school, and for employment, the whole to be attractive in architecture and general arrangement; and it is designed by the projectors to institute the very best school facilities and far better social surroundings for the scholars than are generally provided for the wards of a State. In short, the design is to qualify the inmates for the higher occupations and social walks, and to see that they are duly introduced into them on leaving the school. The act creating this institution provides that "there shall be received as pupils in such school those children that are over four and under sixteen years of age, that are in suitable condition of body and mind to receive instruction, who are neglected and dependent, especially those who are now maintained in the county poor-houses, those who have been abandoned by their parents, or are orphans, or whose parents have been convicted of crime." Doubtless further legislation will be had this year, enlarging the scope of this school so as to embrace all the really neglected and dependent children of the State. It is hoped that the best expectations for this new institution may be more than realized, and that other States will establish similar ones. It is unnecessary to occupy space in this report in calling attention to the numerous and various private charities suggested, established, and sustained by the practical Christian sentiment of the times. Yet we may be indulged in offering our congratulations at the humanitarian and religious activities indi-

cated by these and other means to improve the classes of society under consideration. It is hoped also that the influence of this association may be applied to facilitate a similar tendency in the spirit of civil legislation. When the advocacy and support of the various schemes and measures presented to the Federal and State legislatures are conditioned upon their value to the more defenseless and deficient class of the population, instead of the more influential and better-endowed portions, the prosperity of the whole will be best promoted, and much be accomplished toward the more effectual prevention of crime.

The actual relation between criminals in confinement and the crime class in society, and the proper office of government toward each, are questions that should engage the attention of the association at once, for they must underlie all plans for practical reforms. It is coming to be understood that there is a marked difference between the exposed class and the criminal class—that an individual of vicious impulse who is restrained by his own will or saved from the overt act of crime by his favorable social surroundings is a better citizen than he is when the Rubicon of crime is passed. There is an added impulse given by the overt act, the hold of restraint is weakened, and, as a rule, the chances of moral reformation are greatly diminished. It is this knowledge that is producing the conviction in many thoughtful minds that criminals (and by criminals are meant all those who commit offenses justifying their public punishment) should remain under governmental guardianship so long as is required either for the protection of society or to aid the criminal in his efforts to reform by the moral force of his legal liabilities and relations.

The criminals abroad in society probably supply the prison population to a much larger extent than is generally supposed. Prisoners who are received for the first time at the State prisons for felonious crime, have in many cases been previously imprisoned in jails, municipal prisons, or houses of refuge, for lesser offenses. And the prisoners of the latter class are notoriously repeaters, having had in some cases the experience of imprisonment in the prisons of several States or cities.

It is a popular fallacy that virtuous citizens often suddenly fall into crime and are committed to prison. Such instances may possibly exist, but they form the exception and not the rule. When persons have fallen into crime, having come down from virtuous and respectable heights of character and social position, it has been by an easy descending grade of slight deflections at first, then moral delinquencies of the milder type, until, finally, and often from the accumulated pressure of inward impulse and outward distress, actual crime is committed. But they who have actually *fallen* are but a tithe of the criminal population. The mass are *born* into it, or are *trained* for it, with or without their own consent. The criminal class is an abnormal social growth.

After suitable measures to repress this growth, the first care should be for the discharged criminals. The pittance bestowed on their release from prison and the scanty wardrobe supplied even when accompanied with the "good advice" of the warden and the "God bless you" of the chaplain, are of little worth to the criminal, and much less to society, as a guarantee of his future right conduct; and, as a rule, no guarantee whatever is furnished by the fact of his imprisonment under the best known existing prison system in this country. So that society is in the plight (which would be ridiculous if it were not too sad) of temporarily restraining dangerous persons, then of still further degrading them by penitentiary treatment, and, finally, of turning them loose again, to ply their evil calling, without the least supervisory control.

Protection from discharged prisoners and the requisite aids for reformation must come from benevolent societies, relying upon the prisoner's voluntary acceptance of the proffered help and his permanent choice of an upright and virtuous life, or from governmental guardianship and control. Private benevolence can never meet the want, for it is in its nature fitful, is insufficient in its means, and cannot command the beneficiary class. As a rule, they who most need the restraints and helps to be derived from this source are the last to choose it; their choice is rather indolence, excesses, and such associations as belong thereto. For the few reformed prisoners, and for the imbecile of body or mind, these efforts are of great value; but for the headstrong, heedless, hardened crowd who, having been released from prisons, are now abroad in the community, some authoritative supervisory control must be had, and is, indeed, the best thing for both. This surely can be had, for, however jealously we may guard the individual rights of the humblest citizen who keeps himself within the limits of the law, when he becomes a criminal, or commits offenses requiring, in the judgment of competent courts, his personal restraint, then he cannot reasonably complain if restraint is continued to such an extent, and so long as may be necessary to protect society from his depredations, and to protect himself from himself. Public sentiment on this subject is somewhat divided. There are those who object to laws conferring governmental control of criminals after they are released from prison, on the ground that—(1) Such control cannot be accomplished. (2) That it would create a crime class, generally known to be such. (3) That the untrammelled free action of the mind is necessary to self-improvement and reformation; therefore this control would tend to defeat its own object. Others believe that the apparent difficulty of operating such laws may be overcome by the ingenious mechanism of the law, and by experience in administering it. They believe that the crime class is created already, and that the effect of the law will only be to define and reveal it, which possesses for society, certainly, as many advantages as disadvantages.

Unrestrained action, in opposition to or disregard of just obligation, is not liberty but license. The peace and welfare of society can only comport with absolute individual freedom, when the impulses are pure, the reason fairly developed, the moral sense rightly cultivated, and the whole properly balanced. Not one of us but lives under somewhat of restraint; none can safely give rein to all the impulses of his nature. The amount of restraint should, and in God's moral government actually does, depend upon the moral quality of the mind acted upon. Rightly considered, sin restricts our liberty; so untaught and rebellious citizens should be hemmed in by human laws, and allowed only a limited range for the exercise of free choice.

It would seem to be a self-evident proposition that the unreformed criminals in the community can gain nothing by the absence of restraints, but would gain much that would be of real, though unwelcome value to them, by such continued supervisory control as is here suggested. It is hardly necessary to add that proper governmental supervision of discharged criminals can be had only by continuing indefinitely somewhat of the control conferred by the courts at the time of conviction. Once restrained of liberty for violating the laws, governmental control should never be *fully* relinquished until the prisoner has at least the following qualifications for citizenship: (1) He should be able to read, write, and cipher, sufficiently at least to keep account of his receipts and expenditures, and the mind should be so molded as to make his judgment in common affairs reasonably true. (2) He should possess within himself

the experience and skill necessary to earn an honest living, or be taken in charge by others who are able and willing to provide for him, to which they should be pledged by a bond. (3) Satisfactory evidence should appear, not only that the prisoner has sufficient education and intelligence to care for himself, and possesses the ability to earn his living, or has friends to provide for him in respectability, but that there is a reasonable probability that he will use his faculties and resources aright; in other words, that there have been effected in his mind such changes, and these actually and practically tested, as will afford a guarantee of reasonably right choices in the presence of different motives.

Of course this involves changes in the prison system, but it involves much more than this. There are required training or testing establishments; establishments somewhat technical in their character, specially adapted to their peculiar work, in connection with which probationary periods of enlarged liberty should be allowed. They should embody the following principles, at least: (1) While legal control is retained, there must be such relaxation of present personal restraint that the prisoner is consciously free, under the play of such motives as ordinarily influence individuals in society. Of course, failure to choose and act right within his sphere would be evidence of unpreparedness for return to society. (2) The aim should be to fit each individual for the highest social condition possible for him, and to this end the school or reformatory must embrace instruction in employments, from the humblest mechanic art or agricultural pursuit, to the higher mechanical employments and the fine arts; this upon the principle that the weak and wayward most need the support of good social surroundings, which are most likely to be found among those engaged in the higher employments. (3) A high standard of honor should pervade these establishments, and constitute the disciplinary *régimé*. One who cannot distinguish what is honorable from what is dishonorable and mean, or who, thus distinguishing, has not self-control enough to restrain himself, should be deemed unfit for the school or reformatory, and, after due deliberation, should be banished to a lower grade of the series. Such a sense of honor involves moral integrity and a spirit of self-sacrifice, two qualities of character which, when dominant in the mind, are good guarantees of right citizenship. (4) The principle of religion must surely be implanted here—not any denominational religious *system*, but sincere recognition and reverent love and worship of Almighty God.

Protection for society from discharged prisoners through such establishments as we have described, involves, of course, the preparation of prisoners for such a graduation while they are confined in the other prisons of the state. In other words, a reformed prison system, substantially as described in the Declaration of Principles of the National Prison Congress of 1870 and of the International Congress of 1872; a system in which the object of vindictive punishment is left out; a system in which indulgence for its own sake is left out; in short, a system, which neither relies for the suppression of crimes upon the repression of criminals, nor mainly upon their persuasion, but rather upon their restraint, cultivation, and cure.

That the present wretched apology for a prison system in our country may, through proper effort, be supplanted by a truer ideal, which shall accomplish these results, the committee have no doubt. That, in the progress of civilization, this *will be done*, the committee fervently hope.

It is believed that this association ought at once to ascertain in which of the several States the true ideal of a prison system may best be planted, and that our influence should be brought to bear to accom-

plish it. An examination of the laws and institutions of such State should be had, and the necessary changes therein carefully noted; indeed the whole work of the proposed experiment, and the successive steps leading to it, should be by us mapped out in detail, so that it would only remain for the State authorities to adopt or reject. A carefully selected committee of citizens of such State warmly enlisted in carrying it out, and the expected co-operation of the State authorities, if realized, would be likely to secure the trial, when we could present to other States, and the world, a practical demonstration of the wisdom of the plans and principles we hold, but unfortunately now content ourselves with only proclaiming over and over again in our various public documents.

For the committee:

Z. R. BROCKWAY.

4. REPORT OF THE STANDING COMMITTEE ON DISCHARGED PRISONERS.

The committee on discharged prisoners can add but little to the information contained in the report made to the association by the committee of last year, which presented, as far as it was known, what organized effort had been made in the various States of our Union to improve the condition of this class of persons.

It is sad to look over our vast country and see how utterly inadequate are the means put forth for their relief. We are exhorted by the Apostle, "as we have opportunity, to do good unto all men," (Gal. 6:10;) and it is one of the obvious duties of society, for its own sake and for that of its liberated convicts, to render permanent any beneficial influences resulting from the discipline of the prison. But on the restoration to liberty of many thousands of convicts annually, little care is taken, save in a few favored localities, to give them the hand of Christian sympathy, to encourage them in good resolutions, and to "set them in a plain path because of their enemies." (Ps. 27:11.)

It is very easy to make general abstract declarations of duty or resolutions of action in the premises. A widely different matter is it to decide wisely what ought to be done in the multiform individual cases as they arise, and *to do it*. Whether his term of imprisonment has produced penitence and resolutions for virtuous living, or whether he is impenitent and prepared with whetted appetite to pursue a course of crime, the time of the release for each convict comes. Perhaps, a harsh keeper* who has fed and worked, restrained and punished him, who has looked upon him as one who must be resolutely "kept down," a dangerous man, incapable of improvement, now feels that in parting some "good advice" from himself, as the representative of the State, is called for, and he counsels him to industry, sobriety, and honesty. But such counsel from such a source gives him no strength for the stern battle at once upon him. The grave questions: Where shall he go? What shall he do? With whom shall he associate? It may be the sadder inquiry, who will associate with *him*? press for immediate answer. He feels that he is degraded and disgraced. Shall he seek the friends whom he has grieved, perhaps wronged, or shall he go among strangers?

Does any one think that society has no interest in the solution of these questions? Is it beneath the notice of the conservators of the public welfare what influences shall determine the course of a man, despised indeed, but yet possessed of powers which at this critical moment of his

* Many keepers, it must be said, are not harsh, but gentle and gentlemanly, remembering the golden rule in dealing with those under their care.

life may be directed either to bless or to curse the community? Temptations to robbery, arson, murder run through his mind, but a few words prompted by a kind and loving heart, the offering of a prospect of honorable and useful employment, with a vista of better days temporally and spiritually, may be the means of turning his feet into the paths of virtue. By the rescue of such an one from the toils and penalties of crime and his addition to the ranks of honest industry, society gains by a relief from his depredations, and also from the apprehension of them, as well as by the actual benefit of his labors.

Relief to discharged prisoners, however, requires wise consideration in the individual cases as they occur. It can, perhaps, hardly be accomplished by special homes or manufactories, as has sometimes been proposed. The most hopeful plan appears to be the appointment for each considerable prison of an officer whose duty it should be to make himself acquainted with the prisoners, especially with those whose confinement is near to termination, to win their confidence by kindly ministrations and undissembled interest in their affairs, to learn by delicate inquiry their history, character, capabilities, and desires, and then by outside correspondence to secure, if possible, for each departing convict a comfortable home with employment suited to his needs, to which he can go at once, without being subjected to the temptations of contaminating associates. He should be, if necessary, accompanied to his new domicile.

A mere mercenary laborer is not wanted here. The agent may be a plain man, but he should be possessed of some rare gifts and graces. He must be warm-hearted, generous, and, where it is deserved, confiding, of quick perception of character, of undoubted truthfulness and integrity, and of sound practical common sense, making his counsels valued because they are valuable. He should feel an earnest interest in the spiritual and temporal welfare of his wards, and manifest it by loving watchfulness over their subsequent career, holding them in the bonds of respectful attachment.

Some of the prisoners' aid societies have, happily for their beneficiaries, found such men. Provision for the appointment of one or more agents should be made by law in every State where it cannot be effected by voluntary associations, which, with needful aid from the State, are greatly preferable. To be without some such arrangement seems a folly and a crime, for if society sins by its neglect of duty, it must suffer the penalty. Wardens have reported of some discharged prisoners that they have loitered about the prison for hours, utterly at a loss to decide where to go. Some have been decoyed into vile rum-holes and stripped of the few dollars allowed them on their discharge. Others have been liberated at their own request before the morning light, that they might escape the seductions of old associates whom they knew would be lying in wait for them during the day. Some, refused employment or discharged as soon as their late home was known, or stung by the averted looks and cutting words of old acquaintance, have become utterly disheartened, and, on temptation, have broken sincere resolutions of correct life. The value of the counsel and assistance of a wise and sympathizing agent in such cases need not be shown. This officer should have an office in the prison or contiguous to it, where, by public announcement, he could receive applications for laborers.

It may appear a solecism to say that the care of discharged prisoners should commence on the day of their incarceration, but as the wished-for end is their effectual separation from the criminal classes, it is obvi-

ous that legislative enactments and the discipline of the prison should be such as to promote and, so far as possible, to *secure* that object. The system of marks, and grades, and tests; of religious, moral, and literary instruction combined with labor; of conditionally promised commutation and pecuniary reward—these encourage a prisoner to do right, stimulate him to overcome his evil propensities, and strengthen him in habitual good conduct. Many will thus become worthy of the recommendation of the agent, and will justify it on their complete liberation. Of those who evince no signs of reformation, and who will only return to society to prey upon it, it may not be out of place to express the conviction that they ought not to enter the list of *discharged* prisoners. The victim of some terrible accident is not sent to the hospital for a prescribed time, but until curative treatment restores his bruised body or shattered limbs. An insane patient is retained in the asylum, not for so many weeks, but till returning reason fits him for self-control. In the case of a desperate criminal, a special time-sentence seems equally inappropriate, and should be changed to one conditioned upon his reformation.

For the committee:

SAMUEL ALLINSON.

III.—PAPERS COMMUNICATED.

1. THE CRIMINAL.

By Dr. Prosper Despine, France.

[Translation.]

The importance of this subject appears from the single fact, eminently rational, that a knowledge of the criminal is an essential guide to a right treatment of him; a knowledge of him, not in his acts, which are but too well known, but in his spirit, in the psychical condition which impels him to commit crime, and to renew the monstrous act as often as circumstances permit.

There must be something abnormal in the disposition of criminals, when they yield, with the utmost facility, to desires which would excite the strongest repugnance and horror in a truly moral man. Does not this abnormal state reveal itself in the clearest manner when, contrary to what poets and moralists have represented, we see the wretch who has committed crime exhibiting no symptoms of remorse, but rather a disposition to repeat the same criminal act? Such is the thought which has prompted me to study, with the greatest care, the psychical condition of criminals, or, if you please, the psychology of criminality, in order to fill a hiatus which, hitherto, has existed in science.

I propose, in this paper, to set forth some of the views suggested by my psychological study of criminals. These views, exhibited at length in a work which I have recently published, will be traced here only in outline. But I hope that, however briefly presented, they may engage others to enter the path which I have opened, and to pursue it with perseverance; a path which I consider the most rational and the most likely to lead to a right treatment of those perverted beings who disturb society so profoundly and with such regularity that both the number and the species of their crimes may be foreseen and predicted with almost unerr-

ing precision. Now, just as in order to the rational treatment of a sick man, it is necessary to study the organic disease with which he has been attacked; in the same manner is it essential to know the abnormal psychical condition, or, to speak better, the moral disease which produced the crime; a condition without which, from the study I have made of criminals, great crimes are never committed in cold blood; for I have found, without exception, this abnormal psychical condition in all great criminals.

I have spoken of *moral disease*. This demands a clear and exact definition. Let it not be supposed that I look upon the criminal as diseased in such a sense that, like the insane, he stands in need of medical treatment. If, in certain cases, crime is committed under the influence of a pathological cerebral condition, little apparent to the magistrate, but in general recognized by the physician versed in medical jurisprudence, the ordinary criminal, the criminal who peoples the prisons, is almost always healthy in body. His mental state does not grow worse, like that of the insane patient, in the sense of the gradual destruction of all his faculties. Let us, then, settle this preliminary point, viz, that the criminal is not a patient, and that, in this respect, he must not be likened to the insane.

But, although sound in body, the criminal none the less manifests psychical anomalies of a very grave character. But we must not seek these anomalies in the intellectual faculties, properly so called; in the perception, in the memory, and in the faculty of associating ideas, of reasoning, that is to say, in the reflective powers. Although many criminals are as scantily endowed with intellectual as with moral faculties, it is not the lack of intelligence which is the distinctive character of these dangerous beings; for there are among them persons of great intelligence, capable of forming ingenious combinations, which are the product only of strong reflective faculties. The distinctive anomalies of criminals are found only in the moral faculties, in the instincts of the soul, out of which spring its desires and proclivities, and which constitute our principles of action: for it is these which impel us to act in one direction or in another.

In studying criminals, the first thing which strikes us, and which is obvious to all, is the *perversity*, the criminal thoughts and desires, inspired by the evil inclinations and vices inherent in all mankind, but more emphasized in criminals than in other men. It is the violent passions—hatred, revenge, jealousy, envy; it is also other passions which, without being violent, are no less tenacious in criminals, such as cupidity, the love of pleasure, profound repugnance to a regular life and to labor, and an intense indolence. These two last-named vices impel criminals to seek the means of satisfying the material wants of life and the enjoyments which they crave, not in honest toil, but in readier ways, which are immoral and hateful—in theft, arson, and murder. These qualities in criminals are manifest to the eyes of all. But do these malign passions, these immoral propensities and desires, constitute a really abnormal psychical state? By no means; and the proof is, that these evil tendencies, these wicked passions, these perverse and criminal desires, make themselves felt in the soul of the most upright man, without his ceasing to conduct himself in a virtuous manner, for the reason that he wages a successful warfare against them. There is no need to enlarge upon this point, which is so well known, that persons engaged in the study of the criminal, seeing in him only perversity, vicious inclinations, immoral desires, have considered him, in a moral point of view,

as normally constituted. His moral irregularity, then, is to be looked for somewhere else.

To understand in what this irregularity consists, let us examine what passes in the man recognized as normal in his moral constitution, when he finds himself in presence of a perverse thought, an immoral desire. Every one sees it in a moment. The conscience, that is to say, the right instincts of the soul, the moral faculties, three words which mean the same thing; the conscience, I say, is roused; the moral sentiments, opposed to the vicious instincts, are shocked by these ideas and desires, and, excited by the wound thus inflicted upon them, they react more or less vigorously, according to the degree of power they have in each individual. From this, a moral conflict springs up in the soul between the good and the evil sentiments. In this moral conflict appear, according to the more or less perfect moral nature of the man normally constituted, three orders of sentiments: 1. The good sentiments, which are developed and exert their force on the selfish side—that is to say, the moral sentiments which prompt to virtue and withhold from vice in a well-considered personal interest, but with no other view than some present or future advantage; such for example as the fear of punishment, of public scorn, of the loss of liberty, the dread of being deprived of the enjoyment of one's possessions, of being separated from his family, of leading a wretched life, a life full of privations, &c. 2. The generous sentiments, which lead us to act charitably toward our fellows, under the promptings of a kind heart, and with a view to the contentment of our generous inclinations. 3. The moral sense, the sentiment of right and wrong, accompanied by a feeling of *obligation* to do what is right, not in view of any satisfaction or advantage to be hoped from it, but because it is right; and to abstain from what is wrong, not on account of any suffering to be feared as a consequence, but because it is felt to be wrong. This unselfish and disinterested sentiment is the highest expression of the conscience, and its motive power of action, instead of being some personal interest or satisfaction, is *duty*. It is this lofty moral faculty which makes the man who is so happy as to possess it feel that he must repel a vicious or criminal act, however great the advantage to be gained by it, and however painful the course to be taken. It is this which drew from Kant, the great German philosopher and moralist, the exclamation, profoundly true: "Duty! wonderful idea, which acts neither by insinuation, nor by flattery, nor by menace, but simply by sustaining in the soul thy naked law, thus compelling respect for thyself, if not always securing obedience to thy commands."

Such are the three orders of sentiments, of moral instincts, with which nature has endowed us to combat the perverse instincts which she has also placed in our hearts, thus putting the antidote at the side of the poison.

Let us now glance at mankind as a whole. By the side of men normally constituted, although imperfect because they are men; what do we see? Anomalies, monstrosities. In a physical point of view, by the side of men well-formed, of robust health, of beautiful and noble forms, we find beings sickly, weak, ill-shaped, puny. Viewing men intellectually, what do we see? The same differences. By the side of men of genius, who create sciences, who produce those marvels of the imagination which, in literature and the arts, excite our enthusiasm, we find vulgar intelligences, insensible to the creations of genius and the splendors of nature, incapable of lifting themselves above the direction of their business and the material wants of life. Descending in the

scale, we meet, at last, with the weak-minded, the imbecile, the idiotic. These natural imperfections, these anomalies, these infirmities, these monstrosities, which we see in the physical and intellectual world, exist also in the moral, as marked, as numerous, and as varied.

It is to the reality and the nature of these moral anomalies that I desire to call the attention of this congress, for these anomalies, the saddest, perhaps, of those which affect humanity, are completely ignored, or rather their importance has not been perceived. Just because the man is in health, because he has command of his ideas, because he reasons, because he is *intellectually* intelligent, it has been thought that he must be also *morally* intelligent; that his moral faculties are in a healthy state; that his conscience is capable of feeling and weighing right and wrong, and that he possesses the ability to repress his evil desires without having ever dreamed of studying his moral nature, the state of his conscience; without having once thought of inquiring whether he is really endowed with moral instincts, with the moral faculties directly antagonistic to the depraved instincts.

The infirmities, the moral anomalies, to which your attention has been called, what are they? In what part of the man are they to be sought? Is it in the depraved instincts, in the immoral proclivities, in the criminal desires, even? Not at all; for, as I have already observed, the perverse sentiments, and the depraved ideas and desires which they inspire, are as much inherent in humanity as the virtuous sentiments and their moral inspirations. The presence of perverted sentiments does not, then, of itself constitute an anomaly. Whenever the antidote is found in the heart beside the poison, the moral state of that man is regular. But suppose the antidote represented by the moral sentiments is either too weak or wholly wanting. In that case the anomaly exists incontestably, the moral equilibrium is destroyed, for the virtuous instincts of the soul, and the moral thoughts inspired by them, can alone serve as a counterpoise to the power of evil passions, of perversity. It is this psychic anomaly, this feebleness, this absence of conscience with which criminals are stricken; and it is this alone which makes the criminal; it is this which makes it possible for a man to commit acts that wound profoundly the moral sense. The intellectual faculties are incapable, by themselves, of serving as a counterpoise to depravity; they take part in the combat against it only when they are directed in their activity by the moral faculties. It is a psychological principle which I have demonstrated in the work to which reference was made above, and which shows the supreme importance of the part played by these latter faculties in the battle against crime.

The psychic anomalies now under consideration, the absence of the moral faculties which, connected as it is with the presence of the immoral proclivities, makes criminals, are often hereditary, as are all the other vices which inhere in human nature. How often do descendants inherit from their ancestors the moral anomalies out of which crime, for the most part, springs! Not the slightest doubt can rest upon this point in presence of the numerous examples cited by Dr. Bruce Thompson, physician to the prison of Perth, in the *Edinburgh Evening Courant* of the 26th November, 1869. The organic condition connected with these grave moral anomalies, without being a real disease, since it co-exists with a healthy state of the body, has, nevertheless, a relationship more or less remote, but indubitable, with the pathological conditions of the brain, which produce the different varieties of insanity. The cases in which the children of the insane become ordinary criminals are

too numerous not to attribute the origin of this fact to an hereditary organic influence.

The extreme feebleness, and still more the absence, of the moral instincts, whether due to the fact that their precious germs, congenitally too weak to exhibit themselves spontaneously, have not been developed by a right moral education, or to the fact that the germs of these faculties are altogether wanting, constitute the saddest of the monstrosities to which the human race is subject. This monstrosity may receive various designations; I have given it, indiscriminately, the name of moral idiocy, moral insensibility, lack of conscience, different terms which give an exact idea of its nature. It differs infinitely in its forms, according as the virtuous sentiments are weak or deficient, and in its intensity, according to the degree of weakness found in these sentiments, a weakness which may reach to an absolute nullity. The sentiments whose feebleness or absence makes the moral idiot may be divided into three classes: 1, the moral sense; 2, the generous sentiments—pity, benevolence, charity, respect; 3, the sentiments of prudence, foresight, fear, and a well-considered personal interest. Let us take a rapid survey of the several kinds of moral idiocy caused by the absence of these various moral sentiments.

1. The absence of the moral sense in criminals may be readily made apparent. The conscience of the man who is so happy as to possess it, is wounded by his depraved thoughts, desires, and acts. It is, therefore, evident that he who experiences no moral repulsion in the presence of his criminal desires, and who, after having satisfied these desires, has no feeling of remorse, is really without a moral sense. This absence of moral recoil from criminal desires and of remorse after the commission of crime is a fact of observation of which I cannot now stay to give the proofs; but they have already been given by many observers.

2. The generous sentiments are wanting in criminals equally with the moral sense. Nature has endowed most men with sentiments of pity, of benevolence, and of charity toward other men. But great criminals are an exception to this rule. Without pity for the victims whom they rob or assassinate, the commencement of the criminal act awakens no kindly sentiment within them; nor does it recall them to moral reason, or arrest them in the execution. They destroy everything which forms an obstacle to their rapacity, and they do not cease to strike till their victim is without life. They never bemoan him; they even insult his corpse, cast ridicule upon it, and eat and drink tranquilly beside it. They have no sense of the value of human life. They murder for the veriest trifles, for a few pieces of money, for a momentary gratification; and not a thought is given to the sorrow they will cause to the family of their victim. If they commit the crime under some violent passion, they boast of the act; they glory in it; and they declare themselves ready to repeat what they have done. If their victim has escaped their rage, they loudly proclaim their regret, and express their determination to be more adroit next time. The reports of the court of assizes are filled with evidences of the cynicism with which criminals make these declarations. Insensible to the evil which they commit, regardless of the sad fate of their victims and of their families, they are equally indifferent to the punishments to which their accomplices may be subjected. It is truly marvelous to observe the facility with which criminals, who have been arrested, denounce their accomplices who are still at liberty, and how willingly they aid in their arrest. They do this either with the selfish aim of transferring to their accomplices the responsibility of the acts whose pressure they feel and of being less

severely treated, or with the wicked purpose of involving them in punishment, and of not suffering alone the chastisement with which they are menaced. The bond which unites these wretched beings is interest alone, and not affection. Thus, the moment this selfish bond is broken, they treat each other as enemies.

3. The sentiments which stand connected with a well-considered self-interest are those which are most frequently wanting in these exceptional beings, so abnormally constituted as regards the natural instincts of the soul. The lack of prudence is most conspicuous in individuals destitute of the moral sense, and in whom the selfish fear of punishment is stifled by some violent passion, such as hatred, vengeance, jealousy, and sometimes even avarice. In that case, we see these madmen threaten, publicly or privately, the person who is the object of their passion with the fate to which they have doomed him. These reiterated menaces indicate with certainty a crime on the point of commission, which it would be easy to prevent. There are criminals so devoid of the sentiment of prudence, that they talk coolly of appropriating what belongs to others by brushing aside all the obstacles which they encounter, so that, when the crime has been committed, the author is instantly recognized.

Improvvidence is strongly characteristic of the greater part of criminals. It is owing to this singular trait, which belongs, more or less, to the whole class, that they are entirely absorbed by the desire which possesses them at the moment. One would say that they do not so much as cast a thought toward the future, which, for them, is as though it would never be. The consequences of the crimes which they meditate make no impression upon them; and if they think at all of punishment, it seems to them that they will never be overtaken by it. Their mind is intent solely on satisfying present desires, in regard to which their conscience has no reproaches. In this manner, nearly all pursue the end they have in view, scarcely thinking of punishment, rushing fearlessly after some material good, often of infinitesimal proportions—after miserable pittance of money, madly squandered in a few days, even in a few hours. This extreme improvidence and this absence of fear give to criminals an audacity and an effrontery truly surprising. Without moral curb, and scarcely held in check by the well-considered self-interest which fear inspires, how should they not be daring, audacious? But this blind audacity is not born of true courage, which foresees danger, which fears it even, and which confronts it under the sole impulse of duty. This stolid audacity is the result of several species of moral insensibility, by which the criminal is characterized.

The man who can sell, at so cheap a rate, everything which a rational regard to his own interest would prompt him to desire, must necessarily be but feebly endowed with the sentiments which that interest inspires, and especially with fear. For trifling and transitory advantages, he exposes himself to the hardest chastisements, to the loss of personal liberty in places of detention, where he will be treated with severity; he exposes himself to be separated from his family, to be scorned, to die a violent and ignominious death, which wounds to the last degree the dignity of man. In a word, he prefers a vagrant and precarious existence to a life tranquil and regular.

In presence of these various sorts of moral insensibility, which are found in different degrees in all criminals, can there remain a doubt that these wretched beings are the subjects of a grave moral anomaly? Can there be a doubt of it, when this absence or deficiency of the moral faculties shows itself so palpably in its effects—first in the absence of all reprobation of the criminal thought, and then in the utter absence

of remorse after the criminal act? If I were not restricted to the narrow limits of a lecture, it would be easy to prove that the absence of these higher faculties causes a rude shock to reason and to moral liberty; but I will confine myself strictly to the question in hand.

The understanding, however great it may be, does not prevent or diminish the shock caused to the reason and the moral liberty of the criminal by his moral insensibility; it does not hold this man back from crime. Far from it. The understanding, when guided exclusively by perverted moral instincts, becomes, on the contrary, a power all the more dangerous in proportion as it is developed. Intent solely on the satisfaction of these instincts, it devises criminal projects and seeks the means of carrying them into effect; it produces, above all, malefactors fertile in criminal inventions, able chiefs of criminal gangs. In men depraved and morally insensible, the understanding is, therefore, a dangerous power.

Mere intellectual knowledge has very little influence in holding back these morally insensible natures from the perpetration of the crimes to which they are urged by their evil instincts; of which let the following fact serve as proof. Criminals know that what they do is forbidden by the laws, and that they are menaced by punishments; they know, generally, even the kind of penalties to which they expose themselves by such or such a crime; for professional criminals are well acquainted with the articles of the penal code which concern themselves. But does this knowledge hinder their attempts against society? Not in the least; society is none the less assailed by them. Laws and punishments are alike powerless, when the moral idiocy of these criminally-inclined beings extends to the imbecility or absence of the sentiment of fear; a thing by no means rare. This fact has long been well known, for it is an old experience: "Laws without good morals profit nothing." Laws, without moral sentiments and the good manners to which they give birth, are powerless and vain. The utter inefficacy of mere head knowledge, of intellectual power, before the depraved instincts of men devoid of moral sentiments, has not escaped the sagacity of the honorable president of the American Prison Association, Mr. Horatio Seymour, who expressed it in the following terms, at a public meeting held in New York, January 26, 1872: "Crime grows in skill with every advance of the arts and sciences. Knowledge is power, but it is not virtue. It is as ready to serve evil as good." At a time when almost everywhere, and especially in France, intellectual culture is proclaimed as the principal barrier against crime; at a time when little importance is attached to moral culture by means of education, the true means nevertheless of preventing this odious act, I am happy to be able to cite, in support of my opinion, a respectable name, and one having a higher authority than mine.

I have spoken only of criminals who commit crime in cold blood. I desire to add a few words concerning criminals who commit such acts under the influence of violent passions, such as hatred, revenge, jealousy, anger. In most of these, we find a moral insensibility as great as in cold-blooded criminals; an insensibility proved by the absence of remorse after the crime. Still, a small number of these persons may possess the moral sentiments to a sufficient degree. Suddenly overborne by some violent passion, which instantly stifles and paralyzes the nobler sentiments, they find themselves for the time morally insensible, and they commit the crime at a moment when all they feel and think pushes them on to it, and when none of their virtuous sentiments has sufficient force to combat the criminal desire. But when once the passion is sat-

isfied, it loses its power, and no longer holds complete possession of the soul. Then the moral sentiments, momentarily stifled, resume their activity, and, shocked by the depraved act, they produce a feeling of remorse and at the same time of regret that an act has been done contrary to their own interest; a remorse and regret all the more vivid, because the sentiments which had felt the shock, and which now cause these pangs of repentance, are stronger and more powerful than the passions which had obtained a temporary victory. In some cases, the moral suffering is so violent that it plunges the individual into despair, and impels him to suicide. I can only make a passing reference to these rare cases of genuine remorse after the commission of crime. We never meet with this sentiment in the criminal who has acted in cold blood, and only in a few rare cases do we meet it in one who has committed the crime under the influence of a violent passion. With these latter, amendment is prompt and easy, and relapses do not occur. This fact, which is altogether natural, did not escape Mittermaier. Persons employed in prisons, he says, have remarked that those imprisoned for crimes committed under the influence of violent passions—accidental crimes—sometimes show signs of repentance; that they are more submissive; and that they exhibit a conduct more regular than criminals who have acted in cold blood, and of whom a great number are criminals by profession.

This rapid and very incomplete survey which I have made of the psychical state of criminals, will, I think, be sufficient to convince the members of this congress that account should be taken of it in the treatment to which they are subjected, the study of which treatment is the object for which the congress is convened.

As the criminal offers a serious danger to society, society must defend itself against him; this is an incontestable right. But against whom has society to exercise that right? Is it against a man who has in his conscience, like other men, the necessary means to combat and conquer his immoral desires? According to the very brief description I have given of the abnormal moral state of which all criminals are more or less the subjects, we cannot fail to see that the moral faculties, which are pre-eminently the antagonists of the vicious sentiments, are wanting to them in different degrees. If these men, the subjects of a real moral idiocy, are dangerous, they are also deserving of our pity. To shield ourselves from the danger with which they menace us, we are under a necessity of separating them from society. This separation, with the hard conditions necessarily involved in it, constitutes in itself a punishment. I need not here concern myself with the kind of imprisonment which it is most expedient to adopt in regard to them; that does not belong to the subject which I proposed to consider. Still, I will express, in two words, my thought on this point: I regard all modes of imprisonment as evil and dangerous, as well to society as to the criminal, if their only aim is punishment pure and simple. I think, also, that all modes, provided only that mode is chosen which is best suited to the special character of each criminal, may be good, if they have in view the true interest of society, which is entirely based on the moral regeneration of the criminal, and if also the most effectual means are taken to accomplish that regeneration. The treatment which aims only to punish for the sake of punishing is dangerous both to society and the criminal; it never improves the criminal, and often makes him worse; it produces from 40 to 45 per cent. of recidivists. Let me cite here, as regards the existing prison system in France, some words of a French magistrate, which attest its total want of success. "In vain," says M.

Bonneville de Marsangy, "have our successive governments, in their anxiety for improvement, sent to Switzerland, to Belgium, to Holland, to Spain, to the United States even, citizens of the highest distinction, for the purpose of collecting information on all the experiments which have been tried; in vain have they sought the opinion of the members of the magistracy and of the high functionaries of the administration; in vain have they appealed to the special knowledge of the directors, chaplains, and inspectors of prisons; in vain have the legislative chambers elaborated the bills of 1840, 1844, and 1846; in vain has the Academy of Moral and Political Sciences undertaken the study of this delicate question: we are compelled to confess that, at the very moment in which I speak, all these imposing and multiplied labors and efforts have, so far, wrought no practical result, and the innumerable deliberations had on the penitentiary question, instead of eliciting light, certainty, agreement on certain well-understood points, seem to have produced absolutely nothing but confusion and mistrust, a sort of final impuissance, terminating in the *statu quo*; we are always there." This avowal was made in 1867, in an article published in the *Contemporaneous Review*. And is not this very congress a fresh proof that all is still unsettled in the penitentiary question? If such is the fact, we may rest assured that it is because we have taken a wrong road; it is because, hitherto, having taken as our guides on this question only fear and vengeance, and not scientific *data*, we have ever had in view punishment alone; it is because, never having studied the moral state which leads a man to crime, we have ignored this abnormal condition altogether, and we have not been able to perceive that, in order to arrive at a favorable result, we must aim to bring down to the lowest possible point this anomaly, which is so fruitful a source of crime. I have shown that the criminal is a being apart, that he is different, in a moral point of view, from other men. If this is so, would not the best way to prevent crime and protect society be to cause this difference to cease, if not wholly, since that is impossible, at least approximately, enough to render the criminal a safe member of society. The legislation which takes this point of departure will attain, we may be well assured, a degree of perfection which has no existence at the present moment; for, as Beccaria has said, "All legislation which stops with the punishment of crime, and does not aim to effectually prevent it, is imperfect." Now, to improve the prisoner, to develop in him the germs of whatever good sentiments he may possess, were they but the sentiments of material interest if he has no others, sentiments with which, nevertheless, he will be able to fight his depraved appetites; to give him the habit and the love of labor, by which he will be able to live honestly; and to arrive at these results by humane processes, with a view to teach him by example to act with humanity himself, instead of treating him as we would not treat dumb beasts—is not this the true means of preventing crime?

Reformatory treatment, applied to individuals abnormally organized in a moral point of view, is not a utopia born of my imagination. M. Demetz is the first who practised this treatment in France, which he has done with rare perfection in the juvenile penitentiary of Mettray. While these juvenile delinquents, when thrown into prison pell-mell with adult criminals, showed seventy-five recidivists in every hundred, they show only four per cent. under the strict but paternal direction of M. Demetz. No doubt this system, applied to adults, would require some modifications; but the base would be the same. The reformatory system has been also applied to adults, and, although its application has been but imperfectly applied in their case, it has, nevertheless, yielded

very remarkable results. In my work on criminals I have cited, among other results, those obtained by the director of the penitentiary of Albertville, Savoy, during an administration full of mingled firmness and gentleness. He governed his prisoners by awakening in them virtuous sentiments. By this means he obtained such an ascendancy over them that he did not hesitate to let them go outside of the prison premises, single or in companies, under the surveillance of a keeper, to execute various labors. In this manner he so held them to duty by the bond of gratitude and love, that he was never compromised by a solitary escape; for the prisoners knew that by running away they would compromise the responsibility of their benefactor. Compelled at length by the administration to carry out, in all their rigor, mere official and routine regulations, and that, too, despite the exceptional morality and the habit of work which he had introduced into the prison, this model director preferred rather to resign his position than hold it at the cost of putting in practice a discipline which he knew to be detestable. Nor is this the only example that can be cited in favor of the superiority of moral over physical force in subduing and controlling prisoners. The honorable Dr. Wines, in a report, made at a meeting in New York last January, of the result of his voyage to Europe for the purpose of organizing the International Penitentiary Congress of London, referred to the Irish system devised and carried out by Sir Walter Crofton. "Never have I seen, elsewhere," says Dr. Wines, "anything comparable to the intermediate prison at Lusk. Here is a prison which is not a prison, consisting of two iron tents capable of accommodating a hundred inmates, and a farm of two hundred acres—an establishment without bars, bolts, or inclosing walls; and yet, in fourteen years not a dozen escapes have taken place, thus proving the dictum of Dr. Wichern, that 'the strongest wall is no wall;' in other words, that a wall of influence is stronger than a wall of granite." This is precisely what has been said by M. Vacherot, of the Institute: "Attraction in the realm of mind is the greatest directing force—the surest means of government."

It is not claimed that all criminals are capable of being improved, reformed by moral treatment. This system, although the most rational, will not always succeed. The moral nature of assassins and habitual criminals is so bad that they will sometimes continue rebellious to the end. Nevertheless moral treatment, surrounded by the necessary precautions, ought still to be tried upon them, and may produce marvelous results. However that may be, the criminal ought to re-enter society only when he has given guarantees of safety by his good conduct and industry, either in the prison itself or during a period of provisional liberty, and not at the end of a time fixed in advance by the law, as is the case in the system which makes punishment its sole aim. In a better system, which raises the penitentiary question to the rank of a science, each prisoner should be studied individually and treated according to his character and according to the degree of moral idiocy with which he is affected. To treat all criminals in the same manner is as absurd as would be the proposition to cure all the diseases of the body, diversified as they are, by the same medical agents. It is in making these principles the starting-point—principles based on a conscientious psychological study of criminals—that we shall, little by little, be able to see crime diminish in frequency. I cannot too earnestly recommend this study. The proposal to build any system of criminal treatment whatsoever without giving it a scientific basis is a proposal to rear upon shifting sands a structure that shall be solid and enduring.

Eminent men, inspired by the noblest instincts of the heart, by pity

toward beings morally feeble, have undertaken, by gentle and loving means, to lead them to a regular and virtuous life. In employing a system opposed to official rigor they have succeeded in their attempt. What these benefactors of the human race have essayed under the sole inspiration of their feelings is precisely what is taught by cold, hard science, that is to say, a criminal treatment inspired and guided by a knowledge of the psychical state of criminals and of the laws which govern the moral world. In effect, it is impossible that science should find itself in antagonism with the highest moral teaching, viz, to render good for evil. Science demonstrates that society, in its own interest, should employ toward the man who has injured it a treatment which, though marked by the utmost firmness, shall be, at the same time, humane and charitable.

2. ON THE TREATMENT OF LONG-SENTENCED AND LIFE-SENTENCED PRISONERS.

By Mary Carpenter, England.

The right treatment of prisoners condemned to confinement for life, or for so long a period as to be virtually tantamount to this, has never yet received special attention in public discussion on prison discipline.

It was thought expedient by those who prepared the programme of the recent Prison Congress at London, that this first meeting of the kind which has ever taken place in the history of the world should not be embarrassed by the introduction of any topics likely to involve considerable differences of principle and practice; it was therefore determined that the subjects of inquiry should be confined to the general objects of prison discipline and the reformatory treatment of offenders, whether adult or juvenile. Thus was obtained from that most important assemblage, which represented the whole civilized world, an acceptance and declaration of principles which will serve as a basis of future legislation in every country. Those persons who are cut off from society for their evil deeds, and who are briefly denominated "convicts," can no longer be ignorantly treated in a manner calculated to produce the most injurious effects on society, as well as on themselves. The public has had light thrown on the whole subject, and it is for them to require that the treatment of those who must be returned to their midst shall be such as to give reasonable ground for hope that they will return better, not worse, for their imprisonment. Such is not, however, the case with respect to life-sentenced prisoners. The public sees these persons, as soon as their sentence is pronounced, removed forever from among them. *They will never again take their place in society.* They may even be regarded, and are so by law in some countries, as absolutely dead to the world. The nature of their subsequent life is quite unknown to the public, who cannot intrude on the secrets of the prison house; they cannot make their voice heard to tell of the misery they endure; they will never go forth to say what they have suffered. But the present age requires that the treatment of such persons should be the subject of very special consideration, for the number of them will be continually increasing, as the barbarous death-penalty disappears from the code of civilization. *It is disappearing, and must continue to do so,* as education brings enlightenment with it, and the public mind comprehends the true ends of punishment. The gibbets placed conspicuously on a high hill to scare evil-doers with the sight of decaying corpses are moldering away, and stand only as beacons to mark the progress of society. In

Great Britain, which unhappily still lingers, the ghastly spectacle of an execution is no longer paraded before the public, but is hidden in a horrible seclusion; in a neighboring country the continual legal massacres which are still appalling distant lands have not yet ceased to render the public mind callous, if it is not anguished, by their frequent occurrence. We shall aid the abolition of this inhuman punishment, if we can point out a way in which the ends of justice can be served without it.

It is, then, the object of the present paper to consider the difference which exists between life-sentenced and ordinary convicts; next, to consider the principles which should guide us in their treatment; and finally we shall endeavor to show how these principles may be practically developed.

For this inquiry we shall not consider separately long-sentenced and life-sentenced prisoners, because when the *certain* term of detention reaches fifteen years, or even less, the uncertainty of life, and the knowledge of the changes which must have taken place in all ties of family and friendship, even if liberty is eventually obtained, renders the dreary future as appalling as if it were certain that death alone will release the unhappy prisoner. We shall therefore here speak only of "life-sentenced prisoners."

Now, when we consider the treatment of ordinary convicts, we regard them generally as habitual criminals, such being usually the persons sentenced to a term of years in a convict prison. The cases in which persons are so sentenced for a first offense are exceptional ones. The ordinary convict may be thus described: The habitual offenders who constitute the largest proportion of the inmates of convict prisons are in a state of absolute antagonism to society and disregard of ordinances, human and divine. They are usually hardened in vice, and they concern themselves with the law only to endeavor to evade it. They dislike labor of all kinds, and to supply their own wants exert themselves only by preying on the property of others. They are self-indulgent, low in their desires, ignorant of all knowledge that would profit them, and skillful only in accomplishing their own wicked purposes. Such is not necessarily the case with life-sentenced prisoners. The crime for which this sentence is inflicted is commonly murder, and this crime involves very different degrees of criminality in the several cases, and does not indicate in itself the type of character usually found in the convict prisons. At the same time it shows a mental and physical condition most dangerous to society.

Now, in the treatment of both classes of these criminals the same grand objects should guide us—the protection of society, the minimizing of crime, and the reformation of the offender. It has been shown in the Crofton system of prison discipline how all these may be harmoniously combined. But it is the great aim of ordinary reformatory prison discipline to restore the offenders to society and to obliterate, if possible, the memory of his crime by the entire change in his future life. In effecting this reformation *hope* forms a most important element of treatment, and the daily effort to attain the desired result of the remission of sentence, with other advantages to be enjoyed, especially the attainment of liberty, constitutes the most valuable part of prison training. But in the case of the life-sentenced prisoner, supposing the crime to be murder or some other horrible offense, the memory of it can never be effaced, though repentance may draw a veil before it; society will *never* receive him again, however penitent; no efforts of his can obtain his release; and hope, the grand spring of human action, is

withdrawn from him. The condition of mind in which he is therefore necessarily plunged is one which must render him a burden to himself and a dangerous associate for others. Then, again, the ordinary convict is probably not in general much tormented by the reproaches of conscience. It is not until he has made considerable progress in reformation that he can see in its true colors the evils of his past life and feel remorse for it. But the crimes which receive the award of confinement for life are usually of a kind at which human nature revolts when not under the *immediate* thralldom of violent passion. The secret anguish of remorse so truly described by our own Shakespeare, in his *Lady Macbeth*, must constitute a source of life-misery.

The first murderer, when informed that his life would be spared, exclaimed in the agony of his spirit, "My punishment is greater than I can bear." And the same has been felt by others who, under commutation of sentence, have found the pangs of a guilty conscience in a convict prison more than they could bear, and have committed suicide. Again, the ordinary condition of habitual criminals may be calculated on, and a system of discipline may be arranged for them accordingly. But the crimes which are followed by a life-sentence are very frequently regarded as symptoms of insanity, either temporary or the result of unbridled passions which have destroyed the mental equilibrium; they require special treatment, and for want of any such provision are placed in a criminal lunatic asylum, though in no other respect than the crime they had committed did they show indications of mental aberration.

It is evident, then, that these two classes of convicts are totally distinct, and require a kind of treatment of a very different nature. The very presence of one class with the other is injurious. Every one conversant with prison management is fully aware that the mixture of short-sentenced prisoners with convicts is detrimental to the discipline and order of a jail; the difficulty is not less which is caused by the presence of life-sentenced prisoners, who require, and who ought to have, very different treatment from ordinary convicts. *There ought to be a separate place, in every country, where life sentenced prisoners can be placed to receive appropriate treatment.*

Let us now consider what are the principles which should guide us in our treatment of them.

First. There must be protection to society from any danger arising from the escape of such prisoners. Security is always a very important element in penal discipline, and in this case especially so. The dreadful tragedy by which India was recently deprived of her illustrious viceroy ought never to have taken place. A known murderer, however mild may have been his general demeanor, should never have had the possibility of escaping from surveillance, and availing himself of deadly weapons, especially at a time of peculiar excitement. No one can tell what are the secret workings in the murderer's heart, or the craft with which he can conceal them. The protection of society is of course an important object in all penal discipline, but in this case especially.

Secondly. The deterrent effect on society of the treatment of these life-sentenced prisoners exists solely in the fact of their removal *forever from the world*. The special treatment must be regulated not only so as to secure the personal safety of the prisoner, but at the same time to promote his reformation, as a primary object.

Thirdly. With a view to this last object, the whole system must be so arranged in its different parts as to infuse the *element of hope* into the prisoner from the very commencement of his incarceration. The awful

sentence, "Who enters here, leaves hope behind," placed by Dante over the entrance to his Inferno, must have no place here. Humble penitence for past evil, with deep sorrow for sin, must be blended not only with hope of pardoning love in another world, but also in this. Hope must be excited of the possibility of regaining some happiness even in this seclusion, and even of making some small restitution to injured society.

In order to make myself better understood, I shall here, before stating what I conceive should be the practical development of a prison for life-sentenced prisoners, mention two cases which came under my own observation in a recent journey on the continent of Europe.

The first case was that of a man who was sentenced to twenty years' imprisonment for murder. He was in a jail where strict discipline on the Crofton system was carried out, as far as it could be in buildings not arranged for the purpose, and without any intermediate stage. An excellent tone pervaded the place, and the associated labor had a very good influence on the prisoners, in whom, generally, there evidently existed a desire to do their duty. The director, a gentleman who devoted himself to the well-being of the prisoners and took a strong personal interest in them, informed me that this man had been there for two years, and had eighteen more to remain; that he labored under deep and morbid depression of mind, from which he could not be roused; the future was dark and dreary before him; it was not probable that he would live to regain his liberty; and if he did, what happiness would he have when all his friends would probably be dead or dispersed? The director had tried to place him in associated labor to relieve the gloomy monotony of his life, but his irritable disposition compelled his removal from it. The director asked me to see him. I went to his cell, and found him as described; skilled labor had been provided for him, but there was deep gloom around him. I addressed to him such religious observations as seemed appropriate to his case, and he seemed comforted. The next time I heard of him he was ill. The director found his presence a great difficulty in the management of the prison, nor could he deal with him as his judgment would direct, under such circumstances.

The other case, in another city, was that of a female poisoner who had been confined already eighteen years. The prison where I saw her was a temporary one, formerly a lunatic asylum, and there did not appear to be any attempt to carry out a system in the management of it. I was accompanied by a gentleman resident in the neighborhood. A male official introduced me to the small room where the poor woman was confined. She was in a nervous, dejected state, and said she could not do the work, which lay untouched on her table, from a weakness which evidently arose from dejection. She seemed thankful for sympathy. She complained that she had often been accused of committing, in the prison, offenses of which she was innocent. She had no friends, or relatives, except one son, of whom she knew nothing. It was difficult to know what to say to her. After I left her, and the official had again confined her in her dreary solitude, we heard her singing in a wild, maniacal manner. My friend and I thought that immediate death would have been a more merciful infliction on her than this protracted mental torture. I did not desire to see another female prisoner in the same jail, who had committed many murders. A gentleman afterward told me that he had visited her, and found that a young woman was confined in the same cell with her. I requested my friend to intercede with the proper authorities for a mitigation of the punishment of the poor woman I had seen. He afterward informed me that this was useless, as she was subject to violent paroxysms of passion, requiring sev-

eral men to hold her. Both had done very malicious bodily injury to female officials.

It will surely be acknowledged by any one who carefully considers these two cases, which probably are not equally painful with many which exist in various countries, that the abolition of capital punishment absolutely requires us to consider what is the true treatment of such persons as those to whom it would formerly have been awarded. The civilized world no longer tolerates the infliction of needless physical pain as punishment. We shudder at the torture chamber of Nuremburg and the instruments of torture exhibited in our own capital, as relics of a barbarous age; yet we forget that, excruciating as was the pain then inflicted on the body of the sufferer, it would gladly have been chosen rather than years of mental anguish. We behold the dungeons of our ancestors, and the dens where were thrust, wholesale, the intended victims of the scaffold; or the now crumbling towers where a criminal was immured for a short time, to be dragged forth to the place of execution. But *our* whitewashed cells, with their dreadful monotony, in which a human being is confined year after year, without hope of release, *are not really more humane.*

Let us now consider what should be the nature of a convict establishment for life-sentenced prisoners:

Selection should in the first place be made of a proper site. The safety of society is a primary consideration, and the more secure is the locality the less need will there be for those irksome restrictions which irritate the prisoner, and constantly remind him of his situation. If possible, an island should be selected, or, better still, two or three islands, sufficiently near to each other to be within one general surveillance. The choice of the locality should not be guided by the desire to make the residence there as unpleasant as possible, but, by adaptation to the object, to secure the reformation of the prisoner. Barren, frozen regions should *not* be selected, as some have proposed, where the spirit would become as chilled and frigid as the physical frame; nor unwholesome, tropical places, where the influences are so depressing that the inhabitants of the temperate zone *must* pine away and die miserably. Nor must we choose a rugged and desolate district, where not even bounteous nature repays, as is her wont, the toil of the husbandman. The loving heavenly Father doeth good even to the unthankful and the evil; He sendeth His sunshine and rain on the just and on the unjust. We are commanded to be perfect even as our Father in heaven is perfect. *We must strive after this*, and it is not for us to deprive our fellow-sinners of a single good and holy influence which nature would bestow on them. There should be abundance of land, which the labor of the convicts could make highly productive. Such a site should be sufficiently isolated, and yet not so remote as to prevent the frequent visits of persons whose influence would be beneficial.

The whole territory should be so arranged as to admit of three distinct stages, as on the Crofton system; prisons for separate confinement, for associated labor, and for partial liberty, as in the Crofton intermediate prisons. Besides these there should be a *fourth stage, corresponding to liberty with the ordinary convict.* Here there should be little, except the actual fact of prohibition to pass a certain boundary, which should remind the reformed convict, who has attained it, that he is still under sentence of law. The space should be sufficiently large for the life-sentenced prisoner to have his family around him. Remunerative labor should be provided, by which he might be able to relieve society from the expense of his support, and even to repay what has been spent

on him. He might also be permitted to make some provision for his family, and prepare them for their free entrance on life.

It will be remembered that in Sir Walter Crofton's development of his system in Ireland, *the only complete illustration of it existing*, each stage was at some distance from the others, while his own mind kept all in unity. This was attended with very beneficial effects, as at each stage the mind of the prisoner received a new stimulus. This is even more desirable in the case under consideration, where every available stimulus and excitement should be used to supply the place of that great object of desire, the anticipation of release which has been withdrawn.

While the general arrangements of the Crofton system should be adopted in these prisons for life-sentenced prisoners, the stages may be passed through more rapidly, and more privileges may be allowed as the result of good conduct, such as communication with friends, and the purchase of small articles which may relieve the monotony of the cell. There should also be very careful and scientific medical superintendence of the whole. The mind and the body have much to do with each other, and in such cases particularly.

At Ahmedabad, in India, I saw a very remarkable lunatic asylum, conducted by Dr. Wyllie, the able superintendent of the jail of that place. Never have I seen a more pleasing spectacle of willing, cheerful out-door labor than among the patients of that institution; they were not only earning money but bringing their physical and mental powers into harmonious action. Among these the doctor pointed out to me a class of murderers who were working in as orderly a way as the others. The doctor observed them carefully and regularly, and when he saw in any one of them a peculiar appearance of the eye, he put him under medical treatment, and the danger of an outbreak was removed.

The development of such a convict system for life and long-sentenced prisoners in the Andaman Islands was regarded as very satisfactory, when I had the opportunity of making inquiries respecting it, six years ago. The fourth stage was on a separate island, where the convicts lived in comparative freedom. Many convict women were sent out at their own request to become their wives, and the settlement appeared fully to realize the object intended.

The best treatment of life-sentenced women is a problem more difficult of solution than that of men. The subject is too perplexing and important to be here briefly discussed. Suffice it to say that Sir Walter Crofton has proved that it can be solved, and it ought to be considered most carefully in every country. I trust it will receive the attention it requires from those women as well as men whose *sound knowledge, large experience, and devoted, loving hearts*, inspire them with a faith which can remove mountains.

If there are persons who have so little belief in the possibility of overcoming evil with good, of touching the divine spirit which exists in every child of the heavenly Father, however perverted and enthralled by the animal nature and passions, we would ask them to turn for confirmation of the views taken in this paper to a convict settlement in the center of India. It is well known that in that country there was a race of natives, the Thugs, whose very religion and social customs were based on professional murder, the secret of which was transmitted from father to son, and the practice was thus perpetuated from one generation to another. To reform them seemed impossible. The practice formed so completely a part of their nature that when suffering under punishment they would declare that, whenever released, they

must resume the horrid practice. Some forty years ago these Thugs, whenever arrested, were subjected to strict imprisonment and industrial training in a place appointed for them. As they appeared reformed they were admitted to greater liberty, and a village was formed round them, where their families live. Breach of regulations was at once punished with return to strict imprisonment. Various branches of skilled labor have been introduced into this Thug village, at Jubbed-poor, which are now of great importance in a commercial point of view. An excellent influence has been diffused around, and some of those who were born and bred in jail are now among the first and wealthiest in the community. Why should not the same be done for our life-sentenced prisoners?

3. REMARKS ON SUNDRY TOPICS CONSIDERED IN THE INTERNATIONAL PENITENTIARY CONGRESS OF LONDON:

By the Right Hon. Sir Walter Crofton, England.

MY DEAR DR. WINES: I regret very much that it is not in my power to attend the Baltimore Congress. I need scarcely write that I wish it every possible success. I have been ill for several months, and therefore have been unable to attend the Social Science Congress at Plymouth, or to initiate the further discussions which I consider to be necessary with regard to the "International Prison Congress."

It is undeniable that this congress, thanks to your energy, ability, and, allow me to add, *tact*, proved a very great success. It contained elements of discord which might have produced the result of separating without passing any resolutions. It must be our care that those which have been passed should be thoroughly understood.

Already I see indications that the advocates for strict separation until the end of long sentences do not consider that any resolution has been passed by the congress hostile to their opinions. But, if the resolution recommending the adoption of "*progressive classification*" is not opposed to these opinions I am entirely at a loss to conceive its meaning.

To my mind, the tone of the discussions abundantly illustrated that the problem to be solved was not merely the question between "isolation" and "progressive classification," which had been disposed of at an early period,* but the best mode of preparing a criminal for his release, so that on his liberation he should, by his *prison training*, be made fit for the labor market, and employers of labor be induced to assist him.

You will, I know, agree with me that if our prison training does not attain these ends it has accomplished but a small portion of its real work.

I have listened to many advocates of the system of entire isolation, and have read many of their works; moreover, I have noted its results where carried out for lengthened periods, both in England and in Ireland, but I have entirely failed to realize how it would be possible under any artificial system to attain the all-important ends to which I have alluded.

I fully recognize the value of the isolated system from many points of view. The absence of temptations would reduce the number of prison offenses, and render the management of the establishments much easier, and far more agreeable to the officers. The small number of prison of-

*In the United Kingdom, after much experience, "isolation" for long periods of time has been condemned for many years.

ficers, and the general good conduct of prisoners, will of course induce the assumption that amendment has taken place, which, without the test of registration and supervision after liberation, it will be impossible to verify.

I have for too many years struggled with the difficulty of rendering criminals fit for the labor market and inducing employers to give them work, to believe that this great object can be attained by any artificial process in the criminal training. In some communities doubtless there will not be the same difficulty as in others, but in all, to a greater or lesser degree, difficulties will exist. In the United Kingdom, I feel perfectly satisfied that any attempt to liberate men *after a long period of isolation*, with the hope of their attaining employment, would result in a most disastrous failure.

But do not let me be supposed to undervalue "*isolation*" in its place. As the earliest stage of detention, I have the highest opinion of its importance. I believe every system of prison discipline would fail without this preliminary stage for reflection, so specially well adapted as it is for repentance and religious instruction. It should be ever held to be the basis of all prison systems.

You will, I feel sure, agree with me that the great pressure upon the time of the congress, caused principally by the translation of the papers and discussions, precluded the thorough consideration and discussion which some of the subjects imperatively required. Notably there were two subjects, "corporal punishment," introduced by M. Stevens, of Belgium, and "prison labor," by Mr. F. Hill; the arguments concerning which were based upon a complete misunderstanding of the system pursued in this country, and approved by the Government. The names of twelve or fourteen gentlemen were down as desirous of speaking when the discussion was closed by the chairman.

From want of knowledge of the existing practice, the arguments were based on exceptional cases, and went upon a false issue. Under these circumstances, the feeling at the congress was extremely hostile both to the infliction of corporal punishment and to some of the statutory requirements of hard labor, viz, the crank, treadwheel, and shot-drill. Members of the congress spoke as if these were our ordinary forms of punishment and of labor. But what are the facts?

Corporal punishment is retained as a very exceptional and not an ordinary punishment, and is never resorted to save in cases in which a most brutalized nature has been evinced by the offender, and then only by magisterial order accompanied by medical sanction. It is not true that it is in the power of governors of jails to order its infliction, and those conversant with the ordinary practice of the magistracy in these cases will be amazed at some of the opinions expressed in the congress.

There is no person with an opinion carrying weight who would in this country advocate the general use of corporal punishment. At the same time there would be very few of practical experience but would desire the retention of the power under the strictest safeguards, to be applicable only to those exceptional and brutalized natures which will, unfortunately, be sometimes found in all communities. It is believed, and rightly believed, that the retention of the power prevents in many cases the necessity for its use. It has in several instances prevented bloodshed and murder to my knowledge; and you will recollect statements being made to the congress to this effect by Dr. Mouat, (the inspector-general of prisons in Bengal for many years,) and by your own

very able and excellent governor of Albany penitentiary, General Pilsbury.

With regard to "prison labor," there was very much misapprehension also. The prevalent impression of speakers appeared to be that the use of the crank, shot-drill, and the treadwheel is compulsory by statute. This is not true; it is optional with the magistrates either to adopt these forms of labor or others of a character to insure "hard bodily labor." It had been decided by Parliament that before 1865 the sentences of "hard labor" had not been carried out in our prisons, and that so long as we maintained these sentences we must recognize a distinction between "penal" and "industrial" labor.

But the government never contemplated "hard" or "penal" labor to the bitter end. So far from this being the case, the home office transmitted circulars to the "prison authorities," pointing out how it would be possible, under the prisons act, 1865, to establish a prison system which should lead from penal or hard labor, by a progressive classification, to industrial labor and special employments.

Thus, by a well-regulated system, justice would have been satisfied, a strong motive-power to amendment would have been created, and "industrial labor," being associated with privilege in the minds of the criminals, would be followed on liberation with pleasure and with profit.

A large number of "prison authorities" have, unfortunately, not adopted the scheme foreshadowed in the government circular, and allow the infliction of "hard labor" until the end of long sentences. Nothing can be worse than such a course. But it would be entirely wrong to assume that the government approves of such a practice, as many speakers at the congress did assume, and termed it the "English prison system," for we have only to turn to the convict system, which is under the entire control of the government, to learn its views upon the subject of criminal treatment.

What is required is, that the central authority should institute a uniform system of prison treatment, working it out with the co-operation of local action, and we must come to this; as yet, there is not sufficient power.

It is, I maintain, right for the public, and right for the criminal himself, that there should be suffering for sin, that the preliminary period of imprisonment should be one of suffering, not dictated by vengeance, but as an example to others, and a wholesome discipline to the criminal.

Whether this period of suffering had better be one of strict isolation or of "hard labor" is an open question. If hard-labor sentences could be abolished, I should myself prefer isolation. But in either case this treatment must be followed by industrial labor, which must be earned as a privilege. If the whole scope of such a system is explained to the criminal, it is idle to assume that he would consider penal labor as a degradation. He would realize it as a means to an end, and would co-operate with the system. This has been the case in jails which have a progressive system, and it is not right to assume that because aimless penal labor in jails which have no progressive system is felt as a degradation, it must be so under other and very different circumstances. It is important, all-important I would say, to keep penal or hard labor perfectly distinct from "industrial labor" in the mind of the criminal, for it is necessary that he should dislike the one as associated with punishment, and like the other as associated with privilege and amendment. His well-doing, on liberation, depends upon his feeling in this respect; and those who advocate "industrial labor" at the beginning of sentences, without making it the result of privilege, are associating it

in the mind of the criminal with his penal treatment, and giving him a distaste for it on his liberation. Many years' experience has completely satisfied me on this point, and many years' experience should have pointed out the failure of merely industrial labor in England. Before 1865, it was quite an exception to find jails in which *penal labor* was carried out—the results were so bad as to call for an examination by a committee of the House of Lords, the report of which gave rise to the prisons act, 1865. It is notorious that under the former system vagrants used to commit crime to pass the winter in jail, and this has not been the case since penal labor, (which should not be unproductive,) has been made compulsory in all jails.

I am satisfied that any attempt to eliminate suffering from punishment would have such an effect upon public opinion as to very materially damage, if not entirely destroy, our reformatory and progressive system. No one has a greater right to be heard upon this point than myself, because I have carried the progressive system further than any other person, even to a state of semi-freedom. But this would have been impossible, had I not been able to carry public opinion with me, and to show—as Count Cavour expressed it—that punishment and suffering formed a portion of the system. Experience has also shown me that such a course is an essential element in the treatment of the criminal for his own sake.

It is certain that we have much yet to do. Our classification must be perfected and still further extended. Our education in prisons must be rendered more practical, and made to bear more on the future career of the criminal. Above all things, we must have the active intervention of a central authority to compel a uniform system of prison discipline. It is indefensible, that the exercise of an unchecked local authority should be allowed to result in a very different treatment of criminals under the same sentences, for the whole community is affected by this treatment. We cannot confine the action of criminals to their own localities, and, therefore, it is the duty of the state to interfere.

With regard to sentences, also, some reform is needed. It is very generally admitted that short sentences entirely preclude reformatory treatment, for the time is not sufficiently long to develop it. If we could abolish the intermediate sentences between six weeks and six months, it would be far better for the criminal and the public. During six weeks we could inflict isolation and a low diet for the whole term. From six months and upward we could give beneficial effect to a progressive and reformatory system.

Although we have done much of late in establishing Prisoners' Aid Societies,* we have still much more to do in this direction.

Our "registration of criminals and their supervision after liberation," has not only proved a most efficient check on the criminal classes, but it has enabled us to test, in the only practicable manner, the value of our prison training. Under this test we have the most satisfactory results.

Criminal statistics depend for their value upon the basis on which they are collected.

Any comparison of statistics between different countries, some collected under a stringent system of registration, as in the United Kingdom, and others in a negative form, would be worse than useless as tests of prison system. By turning to my Irish official reports, it will be noted that this was my argument against any comparison of results between England and Ireland, for at that time "supervision and regis-

* There are now thirty-six in England.

tration of criminals" had not been adopted in England. When I think of those reports, and the papers I had to write, pleading (for it was nothing short of pleading) for the adoption of the "mark" system of classification, for police supervision, for the registration of habitual criminals, for a reduction in the amount of gratuities, which were excessive, and for a better subdivision of large prisons, and realize what has since been done, that is, the adoption of all the improvements mentioned, you will agree with me that I have reason to be thankful. It is cheering also to find that the mark system has been introduced in some of the jails in India and the colonies, and that Germany has introduced a well-considered system of supervising criminals.

We must hope and believe that progressive classification will everywhere culminate in "intermediate establishments." We can make allowance for a certain timidity in its application to men, but they will come in time as a consequence of the progress which has been already attained. Surely Lusk, with its sixteen years of successful results, cannot be ignored by thinking men, and that it will not be so ignored in the United States, I feel most certain.

It cannot be doubted that we have much yet to do. But we must stand fast to the principles which we have proved to be sound, and build upon them; we must not confine our operations to the treatment of criminals, young or old, inside and outside of the prisons; and we must place in industrial schools the children of criminals whose future career cannot otherwise admit of doubt.

With my best wishes for your congress, believe me, dear Dr. Wines, yours, most sincerely,

WALTER CROFTON.

HILLINGDON, UXBRIDGE, *December 24, 1872.*

P. S.—I have just received the Transactions of the Prison Congress. Not having seen a proof of any statement made by me, I already observe an error on a very important point, which I shall feel obliged by your correcting at the Baltimore Congress. At page 476, I am reported as stating that, for certain reasons, viz, the high earnings in *free life* in England, it would be difficult to carry out intermediate prisons in this country. This would be nonsense. What I said was, that I had no doubt the English prison authorities had this difficulty to contend with in establishing intermediate prisons, viz, that several of the prisoners (who are skilled) earn in some of the public works prisons 5s. or 6s. a day, and that if they were removed to agricultural establishments, as at Lusk, they would probably only earn 2s. 6d. a day. But I stated that, to my mind, the moral gain would quite outweigh the financial result, and I shall be glad if you will make this point very clear.

W. C.

4. PREPARATORY SCHOOL FOR THE TRAINING OF OFFICERS CONNECTED WITH THE PENITENTIARY COLONY OF METTRAY, FRANCE:

By M. De Metz, Director of the Colony.

[Translation.]

PARIS, *December 31, 1872.*

DEAR SIR: Agreeably to your request, I send you a word in relation to the Preparatory School, (*École Préparatoire*), which I thought it needful to found some time in advance of the reception of the first inmates of the Penitentiary Agricultural Colony of Mettray, for the purpose of training agents who should be competent to the duties of their

high mission. This, from the start, I thought absolutely essential, to the end that I might advance, with firm and sure step, in a path then altogether new and untried.

It is thirty-five years since the preparatory school was founded, and time has but convinced me more and more of the advantages which may be obtained by means of such an institution. Still more recently I have had opportunity to observe how much force and energy this school has given to the sentiments of the young men who have enjoyed its advantages. When our territory was lately invaded by the enemy, many of our under-officers promptly joined the ranks of the army. Those who remained, perceiving the difficult position in which we found ourselves from the insufficiency of our staff, and being fully aware of the exhaustion of our financial resources, resulting from the crushing requisitions of which we had been made the object, sent a deputation to me to say: "We comprehend, sir, how great must be your embarrassment; it will cost us no sacrifice to relieve you from it; pay us half of what we now receive, and we will do double work." I accepted their generous offer, and Mettray came victorious out of a trial so menacing to the future of the colony. Would such devotion have been found in men taken, as it were, hap-hazard, which is but too often the case in penitentiary establishments, and who had not early imbibed the sentiment and formed the habit of duty?

It has been said, with reason, that there is no good penitentiary system without aid to discharged prisoners; so there is no good penitentiary establishment, which does not create a nursery of agents from which to recruit its staff. The men who are needed to implant the love of goodness in vicious natures are not improvised, and moral transformations are obtained only through persevering efforts and an enlightened zeal.

May these considerations, which I venture to lay before you, serve to convince you of my desire to justify a confidence which honors me. Be pleased, sir, to receive, in exchange, the assurance of my high esteem and sincere sympathy.

Yours, from the depth of my heart,

DE METZ.

5. SUSCEPTIBILITY OF CRIMINALS TO REFORMATORY AGENCIES:

By Henry James Anderson, M. D.

DEAR SIR: The board of managers of the Protectory desire me to thank you for your invitation to them to participate, through an appropriate delegation, in the good work proposed for the Prison Reform Congress, soon to assemble at Baltimore.

As the Rev. William Quinn, our advisory chaplain, Brother Teliow, our rector and superintendent at Westchester, and the Hon. John E. Develin, our legal adviser, have been delegated to represent us in the congress, they will be prepared to furnish all the detailed information called for by your respective points of inquiry. I venture, however, of my own responsibility, to state the result of some attention to your eleventh point, viz: the susceptibility of criminals to reformatory agencies.

It is essentially necessary in this matter, if we wish to avoid a painful confusion of ideas, to discriminate in the very outset, at least two classes of convicts—those whose crimes have, on the whole, been justly defined by the verdict, and those whose delinquencies, if any, have been very inadequately represented by the finding of the jury or the judge. The penal discipline appropriate to the former class would be hurtful in

the extreme if applied to the latter, whether the verdict overstated, understated, or misstated entirely the nature and magnitude of the offense. I do not mean to say that it would be safe for the prison authorities to question the correctness of the finding; but it is nevertheless true that a severity of treatment, promotive of the ends of justice in the one case, would be totally ineffectual, not to say ruinous, in its results in the other. To save time, I shall therefore confine these remarks to the first class of convicts, those whose crimes shall have been found to conform in the main with the language of their condemnation.

It has been customary to say that the end of punishment is twofold: first, to reform the offender; secondly, to deter from a like offense the thoughtless or the criminally inclined. The treatment of the transgressor should keep a third end in view, the maintenance of a healthy public opinion, not merely in regard to the gravity of the infractions of the law, but equally so with respect to the necessity of fair dealing in enforcing its provisions. All schemes for the reform of the criminal would be more or less incomplete if these considerations are disregarded; but as the eleventh inquiry concerns exclusively the reformation of the criminal, I shall confine myself to this single point.

What constitutes the criminal? Crime implies either a false sense of duty or disobedience to a true one. As against the state, it implies a culpable ignorance of the law or a wilful breach of it. How far there may be crime in obedience to the law or innocence in disobedience, it would perhaps be irrelevant to inquire. To reform the criminal it is at all events necessary that we should reform either his *erroneous* convictions or his proclivity to disobey his *right* ones. Ordinarily speaking, all true reform demands, on the part of the reformer, a disposition and ability to accomplish one or other of these tasks; and on the part of the transgressor a disposition and ability to look to the moral teacher as his counselor and friend. No real amendment can be hoped for where this relation is not substantially established. The criminal must have for his reformer one whom he *actually trusts and respects*, one whom he believes *means well*, even when the treatment seems severe. So true is this that where this condition is wanting, no amount of benevolence or zeal on the part of the instructor can make up for the defect. All the devices of mere physical appliance, so idly relied upon as efficacious and so often invoked as miraculous or infallible in their effects, are worse than nothing where they work upon *an adverse will*. In the great majority of cases they serve only to harden the offender, who is in fact logical in his contempt of such expedients, as they are in no way calculated to remove his *false* beliefs or to inspire him with loyalty to *true* ones. This is the secret of a trusted mother's influence. This, and this alone, can explain the acknowledged failure of so many well-meant schemes of reform, though sustained by the subsidies of the wealthiest states and the cheers of a world of blinded applauders. The unhappy wanderer who has gone far astray must *believe* in his guide, or he will not follow him; he will not even *listen* to him, and if the unwelcome educator resorts to the use of force and comes to grief in the encounter, the sympathy of the stander-by is very sure to be on the side of the unpersuaded one, *whatever be the style of his resistance*.

It would, however, be wrong to say that punishment has not its uses, or to assert that it can never tend to the true correction of the vicious habits of the offender. Even where punishment but confirms the criminal in his perverseness, it may be necessary as a part of penal discipline. Nevertheless, on every occasion of this sort the difference is immense in results between the system of correction which is appre-

hended by its subjects as coming from a *respected authority*, and that more popular off-hand dealing with delinquents which regards the disgust of the refractory impenitent as a pleasing feature in this less scrupulous method of conversion.

Where the punishers (justly or not, makes little difference) are regarded by the punished as belonging to an order, unsympathizing at least, if not absolutely hostile or unfriendly, it is clear that, under such circumstances, the subject of the most necessary discipline will misconstrue the motives and passionately resent the acts of his correctors. And those who are intended to be warned by these corrections will find all sense of their necessity lost in the sense of their injustice. On the contrary, in reformatories where the inmates (whether for offenses committed before or after confinement) are assured, by evidence or tokens with which they have been previously impressed and familiar, that they are in the hands and subject to the discipline of *friends*, they will cheerfully submit to any measure of coercion deemed necessary, either for their individual correction, or for the maintenance of the general order of the house.

In offering these remarks I wish to be understood irrespectively of the special merits of the *class of reformers* which may have previously gained the confidence of the *class to be reformed*. For the same reason which insists that the child is safer, on the whole, with an indiscreet or over-indulgent mother than with a guardian, however gifted, having no acquired or natural affection for her ward, so it may be assumed that the state will fail of securing the proper training of its delinquent children, whether juvenile or adult, if it neglects to see that each class of these unfortunates is committed to the care of their trusted spiritual protectors. Whether this sympathetic tie be one of nationality, or language, or manners, or religious convictions, or even of mere ritual forms, there is more safety in consulting this affinity than in defying its requirements. Of course there is nothing in this statement that would oblige us to extend it to classes sanctioning or seconding the vices designed to be reformed. The state has a right to require that the guardians, while they show how much they love the *persons* of their wards, are the determined enemies of their faults. And to this end, no class or sect of reformers or protectors should ask to be relieved from giving proof that they have ever made war against the special misdemeanors which have consigned these special offenders to their care. Subject to the strictest scrutiny in this regard, the cure of vices or vicious habits of thought might be left (with hopes of success far exceeding what has hitherto been achieved) to those who are prompted by love and enabled by early intimate relations to cure the infirmities and amend the lives of their pupils, and even to eradicate the false maxims and *dangerous theories of right* by which the criminal is ever attempting to justify his fault.

I repeat again, I have no wish in this argument to present any claim of superiority of method on the part of any *school of reform*. I know of none so *admittedly superior* as to justify the placing of disaffected subjects under its control. Least of all do I wish to see all classes of transgressors, widely differing in their early prepossessions, brought, as they often are, indiscriminately under the only prison reform party which aspires to the exclusive favor of the state; I mean that party (professedly against discriminations) which itself discriminates against all influence derived from considerations of superhuman or supernatural control.

Nor am I any more disposed to see violators of the law, with con-

sciences as divergent as their crimes, with inbred convictions, settled maxims, and cherished delusions as various as their faces or their names, driven helplessly to that most hopeless of moral disciplines, the hearing (under constant and angry protest) of the vapid platitudes of any short-creeded and narrow-minded sect that plumes itself upon being no sect, but rather *an enemy of all*. Far better than this expedient (the most distasteful and the most illogical of any yet tried) is the method of classifying, as far as practicable, the erring children of crime, and of bringing daily each separate class, even if in the main they live together, under the influence of the teaching which alone they can profitably understand. To say nothing of the generous rivalry which might thus be kindled and sustained, the real experience of the world is in its favor, for no success has as yet attended the novel experiment of turning religion out of doors, or the other equally novel one of leaving to the state the choice of a prison creed, and the selection of a catechism the best adapted to contradictory beliefs. If the state abandons, as it ought to do, all attempt to discriminate for or against any religious teaching in its reformatory institutions, let it apply the subsidies it now requires in order that "no particular religion" shall be heard by those who need it most, to the support of as many charities as will be raised in its aid, by those who wish to reach the hearts and consciences of the unfortunates of their own special faith.

Protestant or Catholic, Jew or Gentile, followers of a church which knows no change, or adherents of views which have no continuity or rest, let our prisoned children be educated by their own spiritual mothers; and where they are orphaned by the absence of any such maternal influence, in the name of mercy and humanity permit them (if young) to be taught as their natural guardians may prefer, and (if adult) let them freely give their hearing where they give their hearts, without restriction or dictation from the state, which has never ceased to reaffirm the American principle that, in such selections, the civil power has neither competency nor jurisdiction, nor even a desire to interfere.

With great respect, I remain, yours, &c.,

HENRY JAS. ANDERSON,

President New York Cath.-Prot. Office, 29 Reade street,

New York, January 18, 1873.

Rev. Dr. E. C. WINES,

No. 194 Broadway.

6. DUTY OF SOCIETY TO PERSONS ARRESTED BUT NOT YET BROUGHT TO TRIAL:

By Wm. J. Mullen, prison agent, Philadelphia.

PHILADELPHIA, January 11, 1873.

RESPECTED SIR: Your favor of the circular informing me of the time for the assembling of the Prison Reform Congress at Baltimore, on the 21st instant, has been received, and for which you will please accept my thanks. I am sorry to state that circumstances beyond my control will prevent me from being present at the congress. I heartily approve of the object, and am quite sure that good results will follow the deliberations and action of the congress. It cannot be otherwise. The united efforts of the wise and good, assembled together for such a merciful object, will certainly be attended with divine blessing, that will not only result in accomplishing much good for unfortunate prisoners who may be benefited by the action of the congress, but will also prove benefi-

cial to each member of the congress, who will esteem it a privilege to participate in so benevolent and God-like a work.

There is a subject which, I think, has not received that attention which its importance demanded from the different conventions that have heretofore met on prison reform. It is that of untried prisoners, whose cases should, in every instance, be thoroughly investigated by a competent prison agent before going to trial. Such investigations as have been made by myself in our Philadelphia county prison have prevented the conviction of thousands of persons, who might otherwise have been condemned without such investigations. The friendly interference of an intelligent and disinterested agent, in behalf of the accused, who may be incarcerated, friendless and helpless, and without the means of proving his innocence, in such cases, may result in securing his acquittal, by supplying him with counsel to properly explain his case to the court and have his witnesses present at the time of trial. All well-regulated prisons (in my judgment) should have such an agent, who should make it his special business to do all in his power, in a proper manner, to prevent improper convictions. That has been done effectually in the city of Philadelphia, with the unqualified approval of our highest authorities, from the governor down; and this, too, without impairing the administration of justice; as may be seen in the fact that our criminal judges are united in affording the agent every facility, in his investigations and labors, that is not inconsistent with justice. The court has assigned the agent a position inside the bar, by the side of the district-attorney; and in this way every opportunity is afforded the prisoner to show his innocence. With these facilities, the agent has succeeded in causing the liberation from prison of 32,474 persons within the last nineteen years. Of this number 2,440 persons were liberated through me during the past year. How many of these would have been convicted and caused to undergo unnecessary suffering in prison without this friendly interference of the agent, is a question not easily answered. I have no doubt but that there would have been many thousands convicted out of the whole number, dating from the commencement of the agency. The most of these cases were settled by the agent, with the consent of all parties concerned, before the magistrate, without having been sent to court, the charges having been shown to be so frivolous as to be unworthy of the attention of a jury. The saving in money to the taxpayers of our city, in the release of these prisoners, that would have been required to be paid for food while waiting in prison until the earliest period they could be tried, and what it would have cost to ignore their bills, would have been \$326,112.02. I give this information to show the great amount of good that may be accomplished by the interference of a judicious prison agent. In my judgment, you could not do a better thing than to bring this subject prominently before the prison congress for their consideration. It is a great thing to do all that can be done to ameliorate the condition of convict prisoners; but it is a much greater thing (in my judgment) to prevent an innocent man from becoming a convict and being made to suffer unjust imprisonment. The press of business in our criminal courts, and the hurried manner in which cases are necessarily disposed of in most instances, have been shown to result in the conviction of many innocent persons, whose innocence I have often succeeded in proving to the entire satisfaction of the court, after their conviction. This resulted in the reconsideration of their sentence and their honorable discharge from prison.

The great cause of crime amongst us is intemperance. Nine-tenths of all who are committed to our prison are sent there either through intemper-

ance in the prisoner or the person who caused him to be committed. If the congress would take some action on this subject it would no doubt be attended with good results. Of the half million of persons who have been committed to our county prison within the last twenty years, there have been about 500 committed for murder; 700 additional for attempting to murder; over 40,000 for assault and battery; and over 200,000 for drunkenness. In nearly every case of murder, or where there was an attempt to murder, the parties were intoxicated. Intoxicating liquor is not only a great enemy to the church, but it is the great cause of suffering to humanity. All conventions and all good citizens should speak out against this crying evil, which has done so much toward filling our prisons, almshouses, and lunatic asylums.

In conclusion, I would say that you are at liberty to make what use of this letter you (in your judgment) may think best.

With the hope that the above information may be of some service, I have the honor to be, dear sir, yours, very respectfully,

WILLIAM J. MULLEN.

7. INTEMPERANCE AND CRIME:

By Aaron M. Powell, of New York.

Among the various exciting causes of crime unquestionably the most prolific is the use of intoxicating liquors as a beverage. The testimony to this effect is most abundant.

Lord Chief Justice Sir W. Bovill, an eminent English judge, writing to the venerable archdeacon of Coventry on the relations of intemperance to crime in Great Britain, says: "Amongst a large class of our population intemperance in early life is the direct and immediate cause of every kind of immorality, profligacy, and vice, and soon leads to the commission of crime."

Another eminent English jurist, Lord Chief Baron Kelly, says: "I can only express my belief, indeed I may say my conviction, that two-thirds of the crimes which come before the courts of law in this country are occasioned chiefly by intemperance."

Still another, the Right Hon. Sir H. J. Keating, adds his weighty testimony as follows: "I should suppose the testimony of every judge upon the bench would be the same as to the fact that a very large proportion of the crimes of violence brought before us are traceable, either directly or indirectly, to the intemperate use of intoxicating liquors. In my own experience of more than nine years upon the bench, corroborated by a very long experience at the bar, I have no hesitation in saying that such is the case. Some of the saddest cases with which we have to deal are those in which men go into public houses respectable and respected, and come out felons."

Police Magistrate Raffles, for the borough of Liverpool, says: "The truth has been so universally acknowledged by all our judges of the superior courts, and by those who have presided over our sessions courts, that I can add nothing to give weight to what has been taken from them, viz, that drunkenness is the cause of nine-tenths of the crime which exists in this country. I can but confirm the sad conclusion. Perhaps I have seen as much of it during the last nine or ten years as any one."

Lord Chief Justice Bovill adds to his own the following testimony, which I quote from the official presentment of a grand jury of Leeds: "The grand jury having again, as on many previous occasions, had

their attention called to the large number of crimes of a serious character whose origin is traceable to beer-houses, desire to express their strong opinion that some alteration should be made in the existing system of licensing, with a view to place beer-houses under such supervision as would check the evils now so grievously complained of."

An English prison chaplain says: "About five hundred prisoners are annually admitted into this prison, and I consider about four hundred are the victims of intemperance."

Another says: "I have no doubt but that intemperance, directly or indirectly, is the cause of nine-tenths of the committals to prison."

A governor of an English prison, writing of his charge, says: "Since I have been appointed to the charge of this prison I have had under my charge eight hundred and forty-one prisoners, and all the crimes have been committed when under the influence of intoxicating liquors, with the exception of twenty-six."

While in attendance upon the international prison congress, held in London in July, 1872, with this subject then upon my mind, I took occasion to consult distinguished delegates who were present from various countries, as also in journeying and sometimes visiting prisons in a somewhat extended European tour, and the testimony of all showed at least three-fourths, and often a much larger percentage of crime, to be traceable to intoxicating liquors as a primary cause.

I will now cite briefly the testimony of a few competent witnesses as to our experience in this country. And first I will quote from a document published by authority of the legislature of the State of New York, the twentieth annual report of the executive committee of the prison association of New York, the following: "There can be no doubt that of all the proximate sources of crime the use of intoxicating liquors is the most prolific and the most deadly. Of other causes it may be said that they slay their thousands. Of this it must be said that it slays its tens of thousands. The committee asked for the opinion of the jail officers in nearly every county in the State as to the proportion of commitments due either directly or indirectly to strong drink." On a preceding page is the following: "Not less than sixty thousand to seventy thousand human beings, men, women, and children, either guilty or arrested on suspicion of being guilty of crime, pass every year through these institutions. The judgment of these jail officers varied from two-thirds as the lowest estimate to nine-tenths as the highest, and on reducing the several proportions to an average, seven-eighths was the appalling result obtained."

The Rev. William M. Thayer, the secretary of the Massachusetts Temperance Alliance, in his official report for 1872, referring to the House of Industry, and other public institutions of Boston, says: "Of the total commitments to the House of Industry, for the year ending May 1, 1872—amounting to 4,417—all but 305 were for drunkenness, and offenses caused by drink. The records of the public institutions of the city show that 95 *per cent.* of all the arrests, of late, have been for drunkenness, and crimes caused by intoxicating liquors."

Governor Washburne, of Massachusetts, still more recently, in his message at the opening of the legislature now in session, in referring to the beer-shops and the liquor question, says: "If we are to accept the evidence of those who have had the most painful experience of the miseries produced by these places, they are among the greatest obstacles to the social and moral progress of the community. The testimony of criminals of every degree is, that they were drawn, by frequenting beer-houses, into offenses and violations of law of which

they might otherwise have remained innocent. The wise and prudent legislator will not cease his efforts for the diminution of crime till every measure has been adopted which experience proves needful."

I might, if the limits which I propose for this paper permitted, quote voluminously from the official records of the courts, State and municipal, of almost every State in the Union, a mass of testimony, all bearing upon this point, and showing throughout the close connection between intoxicating liquors and crime. I will venture to cite the recent experience of Boston in connection with the late destructive fire. In the great emergency created by the fire, and with a large influx of thieves from New York, every precaution to prevent disorder and riot became necessary. An edict of absolute prohibition was issued by the city authorities against beer and all other intoxicating liquors, which was in force ten days. The chief of police of Boston, E. H. Savage, esq., thus testifies as to the diminution of arrests, even with the greatly increased liability to criminal disorder, during the ten days of prohibition. He says: "For the ten days preceding the order, viz, from November 2 to November 11, inclusive, the records show the whole number of arrests to be 1,169. For the ten days in which the order was in force, viz, from November 12 to November 21, inclusive, the records show the whole number of arrests to be 675."

In Massachusetts, at the present time, the liquor traffic is carried on chiefly in what are called "beer-shops," the towns voting annually upon the proposition whether they will or will not authorize the sale of beer. As the mercury in the thermometer indicates the rising or falling temperature, so do the court-records of these towns as sensitively indicate the state of the liquor traffic. It is understood that those who know how to say beer with the right inflection can obtain almost any kind of liquor desired at these licensed shops. I will cite but a single illustration. "In 1871 the city of Taunton voted 'No beer.' The number of arrests for drunkenness from May 1 to December 31, 1871, was 290. In 1872 the city voted in favor of the sale of beer, &c. The number of arrests for drunkenness from May 1 to December 31, 1872, was 492, being an increase over the previous year of 202, or about 70 per cent."

Governor Dix, of the State of New York, in his recent message to the legislature now in session, calls attention to the alarming prevalence of crime in the city of New York as follows: "The alarming increase in frequency of the crime of murder in the city and its environs demands your most serious consideration. Scarcely a day passes without witnessing a brutal, and in many instances a fatal assault, upon the persons of unoffending individuals, usually in drinking saloons."

Rowland Burr, esq., for nearly twenty years a magistrate at Toronto, stated to the Canadian parliament "that nine-tenths of the male prisoners and nineteen-twentieths of the female are sent to jail by intoxicating liquors. In four years there were 25,000 prisoners in Canadian jails, of whom 22,000 owed their imprisonment to drinking habits."

I will only add in the way of testimony that I understand the very recent message of the mayor of this city of Baltimore enumerates an aggregate of some 10,000 arrests for the past year, about 8,000 of which are to be ascribed, directly or indirectly, to the use of intoxicating liquors.

Do we seek the prevention of crime? Would we extend due protection and encouragement to discharged prisoners? If so, we have a twofold duty: first, to protect the weak from unnecessary temptation by a wise policy of legislation; and, second, to employ the ministrations of genuine, practical religion.

If government may arrest and restrain the criminal, it may interpose its beneficent authority to remove palpably demoralizing agencies; it may close the wide-open doors of temptation. If it may blow up and destroy blocks of magnificent buildings to save a city from conflagration, it may not only organize and sustain a vigorous fire-department, but also prohibit altogether a particularly dangerous fire-inviting architecture. That is a poor type of statesmanship, scarcely deserving the name, which deals only with results, and does not at the same time look at and give due consideration to their producing causes. None should be permitted to prosecute a traffic for the sake of gain by pandering to the vices and inflaming the passions of those who are weak or criminally inclined. As infected ships are quarantined in the interest of the public health, so must be the grog-shops and drinking-places for the protection of the weak against undue temptation, as well as society against the depredations they may be expected otherwise to commit.

Most important of all is the religious obligation imposed by the high ideal of Christianity toward those who have gone astray and who are most exposed to wrong-doing. In the administration of prison discipline it prompts to justice, firmness, and kindness judiciously blended; in caring for discharged prisoners, it prompts to extend the helping hand to those sorely needing assistance in taking the first step aright in returning again to society from their incarceration; but especially does it exact of us all, in the presence of such responsibilities, right precept and example. Is strong drink the besetting sin of the criminal classes? Does it cause our brother or sister to offend? Then is it our religious duty to do what we may, each in our own way and sphere of activity, to discourage the drinking usages of society. How frequent and how sad are the falls from high social position to the deepest depths of misery and crime. How many households with haunting skeletons of the worse than murdered victims of the drink-demon. Especially should there be thoughtful consideration of the young. To them, and to all, we should exemplify and teach temperance, truthfulness, and brotherly kindness, and thus build upon the solid foundation, forestall crime, and inaugurate the era of a true Christian civilization.

8. PRISON REFORM IN PENNSYLVANIA.

The board of public charities of Pennsylvania, through its president, the Hon. George L. Harrison, submitted to the congress a summary of views and suggestions contained in its report for 1872. This paper, slightly condensed, is as follows:

It states the opinion that, in dealing with crime, preventive rather than curative measures ought to be mainly relied upon, among which it enumerates the following:

1. A thorough system of universal education.
2. Special and effective agencies for the care of truant, vagrant, neglected, and overtasked children.
3. A much larger provision of reformatory schools and houses of correction for the various grades of juvenile offenders.
4. Provision for the proper care of the helpless and pauper classes.
5. Effective laws for the suppression of intemperance.
6. Adequate provision for the restraint and employment of all idle vagrants.
7. Provision, in the county and municipal prisons, for the separate treatment of vagrants, witnesses, and persons charged with crime, as well as convicts.

The remedial system, or prison discipline proper, should be based on the fundamental principle of reformation through punishment, and not of punishment as an end. Such a system should contain, among others, the following features :

1. Sufficient provision for the separate confinement of each prisoner.
2. After a suitable period of separate confinement and the performance of certain prescribed tasks, provision should be made for the employment of the convicts in voluntary productive labor, as a means of moral improvement and a preparation for their future self-support.

3. Unless solitary labor should be preferred by the convicts, this labor to be performed in small companies or families, properly selected, the members having free intercourse together, and being mutually responsible for each other's conduct.

4. The proceeds of the labor to be appropriated: *a.* To defray the current expenses of the convict, and to indemnify the State. *b.* To contribute to the support of the convict's family, if necessary. *c.* To the convict himself, to go partly to form a reserve fund against the time of his release, and to be used partly as he may choose for procuring present alleviations and comforts.

5. Instruction should be given to all the convicts as they may need: *a.* In some trade or handicraft. *b.* In the elements of learning and knowledge. *c.* In the principles and practice of morality and religion.

6. Considerate and humane treatment to be emphatically insisted on, using, as far as possible, moral influence instead of physical force, and endeavoring, above all things, to develop the self-respect and manhood of the prisoners.

7. A careful classification of the prisoners to be constantly kept up, and from time to time corrected—a classification based not upon any extraneous or arbitrary considerations, but upon character and conduct.

8. Provision to be made for securing a corps of judicious and, eventually, experienced prison keepers, so as to render the profession of prison-keeper honorable and respected, to which end special schools for their education and training should be established.

9. The substitution of meritorious conduct and probable reformation for mere lapse of time, as the ground of final discharge; that is to say, until convicts have earned their release by such evidence of good conduct and habits as will rationally imply their permanent reformation.

10. There should be, in the case of each convict, a certain time-sentence, graduated according to his offense, but always long enough to give full opportunity for reformatory processes to take effect.

[The board is aware that the ideal perfection of the plan which makes the discharge of every prisoner dependent on his reformation, would require too great a revolution in legal and popular ideas to be as yet expected or asked for.]

11. A system of marks to be instituted which, under fixed rules, may be a guide for classification and rewards, as well as for the final judgment; having a debit as well as a credit side, and providing for loss of standing and class, or even for remanding to the cell, in case of misconduct.

12. Intermediate prisons to be provided, where the prisoners, still remaining undischarged, may be finally tested, by being trusted with a great degree of liberty, and left in large measure to control themselves, under most of the ordinary temptations of free life, yet liable, for unfaithfulness, misconduct, or attempted escape, to be degraded and sent back to begin their work over again.

13. Refuges to be provided for released prisoners, to facilitate their return to society, where they can have, at their own expense, lodging, maintenance, and means of employment, until they can procure employment elsewhere.

The board express the opinion that such a system would, as a matter of course, require unity of control. All the prisons and houses of detention in a State, of whatever kind or class, should be placed under the supervision and general direction of one head or of one board of managers, representing the authority of the State. In respect to all matters of prison construction and prison discipline, the county and municipal authorities should be required to act under direction and control of this central and supreme authority.

9. HOPE THE GREAT REFORMER :

By Hon. B. F. Butler.

MY DEAR SIR: I have but this moment got round to the matter of your inquiry among other more urgent duties. You desire me to state to you the method by which I conducted the military prisons and governed the prisoners during my command of the Department of Virginia and North Carolina, in 1864.

First thanking you for the compliment of commendation of the manner of managing prisoners, I grieve that I shall be unable, being entirely without the statistical details of the subject, to give you any exact statistics. I will try, however, to state, in a manner that will be understood, the plan upon which perfect discipline was enforced.

When I took command in November, 1863, at Fortress Monroe, I found a large number of deserters, thieves, and bad criminals of the Army, sentenced by court-martial to hard labor for longer or shorter periods. They were confined in an old naval depot, known as Fort Norfolk, and their hard labor seemed to be, substantially, sleeping all day and playing cards all night; so that the sentence to hard labor at Fort Norfolk was rather a favorite method of passing their term of enlistment by the wicked and perverse of the army; both may be comprehended under the name of "shirks." I looked around for some suitable place for confinement at hard labor, but found none. I have a Yankee horror of what is known as the "chain-gang," and therefore did not like to work these men chained together. I was told that it was impossible to make them work without paying them wages. Upon that I doubted. I agreed that it was impossible to make men work to any effect without fear of the lash or other punishment, or the hope of some reward. I therefore sent to Massachusetts and obtained some of our Massachusetts correction-uniforms, which consist of a gray and black suit, half and half, cut down the center, and a scarlet cap. I clothed my prisoners in this uniform, which, as you see, was very distinctive. I put them under the charge of the proper officer and a superintendent, who had at first some men to guard them, and put them to work in the spring in cleaning up the streets, and alleys, and lanes of the city of Norfolk, much of it very offensive and troublesome work. I gave those that worked in the midst of nauseous effluvia and in unhealthy situations a ration of whisky; I gave all that used it a ration of tobacco. I saw that they were well fed with wholesome and nourishing provisions. They were taken to their cells at night to sleep, and, after a day's work of ten hours, they were quite ready to do so. I then directed the superintendent to keep a roll of merit of the men, of which they were informed, and empowered

him to recommend me to have stricken off from the sentence not exceeding ten days in each month, according to the diligence and steadiness with which men performed their duty; and in cases of great merit a larger portion of the specified time of punishment might be remitted. In case of refractoriness, solitary confinement, loss of the ration of tobacco, and bread and water, were the punishment.

The sequence—and perhaps I may say the consequence—of this was, that a better gang of laborers, more orderly and more quiet, I have never known. I never lost one by running away; I never had but one attempt to get away, and he failed; and after being shut up a week he begged so abjectly and persistently to be allowed to take his place in the working gang again that it was permitted; and he finally got $33\frac{1}{3}$ per cent. of his time of punishment remitted for good conduct. I even took the gang out into the swamps on the Chesapeake and Albemarle Canal to repair a break, and although the country was overflowed, I only lost one there, and am uncertain to this day whether he deserted or was drowned.

The prisoners under this system did work which, at any reasonable price—and an account was kept with the city of Norfolk of what they did do at a price—would have several times compensated for the cost of their keep. I insisted upon three things: perfect cleanliness and purity in their cells and places of sleep during the night; nutritious and wholesome food three times a day, viz, before they went out, at noon, and after they came back; and diligent, industrious, hard labor of ten hours each day, with a reward for labor that was meritorious by remitting a portion of the punishment.

I have long thought that the system of labor in our prisons, where the laborer had no hope and nothing to labor for, was upon a wrong principle. My acquaintance with prisoners as a criminal lawyer taught me so much. I had an opportunity to try a different theory and availed myself of it, and that is all.

Renewing, my dear sir, my assurances of highest regard and respect,
I am, yours truly,

BENJ. F. BUTLER.

DR. WINES.

19. THE FINAL CAUSE OF CRIMINAL LEGISLATION AS AFFECTING MODES OF PUNISHMENT:

By James Freeman Clarke, D. D.

I. Whatever may be thought of the study of final causes in science, it is certain that, in regard to all social questions, it is very useful to inquire often: What institutions are for? What is the purpose of such and such customs? What is the end proposed by this or that course of action? These questions are the surest tests to apply to human institutions in order to learn whether they are working well or have fallen into ruts, so that things are done to-day because they were done yesterday. If I wish to apply a sharp test to any social arrangement—to a college, a church, a law, a society, a hospital, &c., the best thing to do is to ask, (1.) What is it for? What is its aim and end? And then, (2.) Is it accomplishing that purpose, or is it not?

II. In regard to criminal legislation, several different objects have been assumed. It is important, therefore, to ask what are the true ones, and, among these, which are the most important purposes? Thus criminal legislation is sometimes regarded as penal or punitive. Its object is supposed to be to punish the criminal for his guilt. Again, it is

thought to be reformatory. Its object, according to this view, is to improve the morals of the man who has committed a crime. Lastly, the purpose of these laws is considered to be to protect the community. They are to prevent crime by making it dangerous and disagreeable in its consequences. Let us consider these three supposed purposes of criminal legislation, and find which is the truest and most important.

III. If the object of criminal legislation is to *punish* crime, we naturally ask, what right has society to punish, and how is it able to do so? "Vengeance is mine, I will repay," says the Almighty. Only God can punish justly, for only God can read the heart.

If God has delegated to society the right to punish, he must also have given the power. But evidently society has not the power to inflict just punishment on guilt, since it cannot discern motives nor allow for circumstances. It is obliged to judge the outward action mainly; and its judgments in a moral sense must always be very imperfect. Therefore, though the notion of a just retribution may enter into the idea of criminal legislation, it cannot be its main object.

The argument for punitive legislation has been stated strongly by Victor Cousin, in his notes to the *Gorgias* of Plato. He says, "Justice is the true foundation of punishment; personal and social utility only a consequence. In the intelligence, the idea of punishment corresponds to that of injustice, and when the injustice has been committed in the social sphere, the punishment ought to be inflicted by society. Punishment is not *just* because it is *useful*, but it is *useful* because it is *just*."

No doubt it is true that punishment expresses the moral indignation of the community against crime, and this is a healthy and useful result of punishment. It is good for the criminal to feel that the punishment he suffers finds an echo in the public conscience. Nevertheless, human punishments are so very imperfectly adapted to degrees of guilt, that if moral retribution were regarded as their main object, they could hardly be sustained. It can only be a secondary purpose.

IV. Is, then, the main object of punishment the reform of the offender? But what right has society to assume to itself the moral education of certain persons and sequester them for that purpose, depriving them of their liberty? Is it because they have shown themselves by their conduct to be in great need of improvement? But others need it also, in a less degree; and those whose outward actions have not been so offensive to society may, in their inward character, need reform much more. If the object of penal legislation is to reform the criminal; why select one class of offenses only? Why not imprison the covetous, selfish, untruthful, proud, vain, licentious? They need reform, surely, as much as do thieves and robbers? It is evident, therefore, that the moral improvement of the criminal can only be a secondary object of punishment.

V. The proper end of all human laws is declared by publicists to be the promotion of the temporal well-being of the community. It is also often stated that the proper end of *criminal* law is the prevention of injuries by the terror of punishment. But since crime may be prevented in other ways, a better statement would be that "The object of criminal law is the prevention of crime." This definition excludes the notion of punishing the criminal, and also that of reforming him, except so far as his punishment or his reformation may conduce to the protection of society. These two purposes become secondary and ancillary. Thus the question is simplified and put on a practical basis.

VI. We assume, then, that the object of the criminal law is the protection of the community, by preventing crime. That the community

has a right to *punish* guilt may be questioned. That it has a right to select some bad people to *reform* may be doubtful. But no one can deny that it has a right to protect itself against injury. If criminal legislation has this for its avowed object, it rests on a perfectly firm foundation.

Now, penalties inflicted on crime may protect the community in several ways. 1. By fear of suffering, which prevents the commission of crime. 2. By the actual restraint of the criminal, which disables him from committing crime. 3. By the education of the conscience through the act of public justice. 4. By the reform of the criminal. We will consider them in order.

VII. Criminal law in its early stages lays most stress on terrific punishments. Its laws are written in blood. The death-penalty is applied to numerous crimes. The prisons are places of torture, and any attempt to alleviate the sufferings of the prisoner is regarded as rose-water sentimentalism. Wright, in his "*Homes of Other Days*," describes the English prisons after the Norman conquest thus: "Imprisonment, even before trial, was made frightfully cruel; the dungeons were filthy holes, in which loathsome reptiles were bred, and the prisoners were insufficiently fed, and sometimes stripped naked." In the middle ages, he adds: "The gallows and the wheel were so commonly used as to be continually before people's eyes. Every town, every abbey, and almost every manorial lord had the right of hanging, and a gallows or tree, with a man hanging on it, was so frequent as to be almost considered a part of every landscape."

But as society advances these punishments appear shocking to the community, and it is found that severity in punishment leads to impunity. When punishments are more severe than the public sentiment approves, they are not inflicted, and the criminal escapes all punishment. One of the accepted maxims, therefore, of modern criminal jurisprudence is, "Crime is not prevented by the severity but by the certainty of punishment."

VIII. When criminals are in prison they cannot commit crime, and the community is thus protected by any kind of incarceration; but most terms of imprisonment are too short to do much good in this way. Short imprisonments also interfere with the reformation of the prisoner. He is thinking more of getting out than of reform; he has no time in prison to break up bad habits, or form good ones; he has no time to learn a trade, or to get any education, and so he usually goes out as bad as he came in, and is prepared to begin immediately a new career of crime. The protection of the community, therefore, seems to require that instead of short terms there should be substituted a sentence of indefinite confinement, the termination of which should depend on the behavior of the prisoner. An ignorant prisoner might be sentenced until he should have mastered a trade and acquired the rudiments of education. Fixed terms of imprisonment of different duration have probably come from the notion that the chief end of penalty is to punish guilt. Such a crime, it is thought, deserves ten years' imprisonment; such another merits only five; another only six months, &c. But if the purpose of imprisoning criminals is to protect society, they ought not to be set free until they have formed such new habits as will make it probable that they will lead honest and industrious lives.

IX. It is no doubt true that a public trial and conviction, if conducted properly, tends to educate the general conscience. But this result depends on the public belief that the innocent man will be generally acquitted and the guilty condemned. Justice becomes a farce when great

criminals, known of all men to be guilty, can readily escape punishment by the help of able lawyers, skillful bribery, absurd forms of law or iniquitous judges. Hence criminal legislation should aim at embodying the results of the largest experience and wisest study, and hence, also, the pardoning power of the executive should be limited.

X. Society is protected by the reform of the criminal. It is only on this ground that we can properly advocate such measures as will lead to this result. But it is evident that, if no criminal is allowed to leave prison except when he has become an honest man, the most fruitful source of crime would be stopped up. If a man come from prison unreformed, he comes out hardened, and becomes the most daring leader in outrages on the public peace.

Now the opportunities of reforming a criminal while in prison are very great if they are rightly used. He is absolutely separated from temptation, from evil companions, and bad influences. He is placed in a comparative solitude, where, if ever, he must reflect on himself and his conduct. We have the power of shutting out all bad influences, and letting all good ones in. We can give him the industrial education and intellectual education in which the majority of criminals are deficient. And finally, when he leaves the prison, he comes out ready to pursue some honest trade, and to commence a new mode of life.

XI. All these ends are attained by what is commonly called the "Irish system." Under this plan a prisoner is sentenced for an indefinite period, the duration of which he can greatly determine by his own good conduct. There are graded prisons, rising from those where there are the least liberty and the greatest hardship, to those in which are the most liberty and the least hardship. The prisoner, as his conduct is good, is gradually transferred from the lower to the higher prison, and thus is under the influence of hope no less than that of fear. He cannot leave the prison regularly, except by graduating from the highest class, and so coming out as a man proved to be a reformed man, not by plausible speeches, but by a long course of good behavior. Leaving the prison thus, known to be a reformed man, he has no difficulty in finding employment, and the taint of the prison does not adhere to him, to interfere with his attempts at earning an honest living. He finds work easily, and starts with a good standing in society.

XII. Therefore, if we consider the protection of society as the final cause of prison legislation, we are led directly to this system of "Irish prisons," as best accomplishing the end. Of course we include in this term all the methods which belong to this general plan. We advocate the reform of the prisoner, not in the interest of philanthropy or religion, but in that of society. We reform the prisoner in order to protect society. We abolish cruel punishments in order to protect society. We introduce hope into the prison to protect society. And in doing this, there is no danger that the prison will become too attractive; for this plan does not diminish restraint, but rather increases it; and with this plan naturally belong more certainty of conviction, less hope of pardon, and no prospect of leaving the prison except by genuine and demonstrated repentance and reformation.

11. THOUGHTS ON PRISON TREATMENT:

*By Alfred H. Love.*PHILADELPHIA, *Firstmonth* 20, 1873.*To the National Prison Association of the United States in convention at Baltimore:*

RESPECTED FRIENDS: I rejoice that you are holding a convention for the consideration of the highly important subjects connected with prison discipline. I thank you for your invitation, and regret that my engagements are such as to prevent my accepting.

For fifteen years I have been a visitor of our Eastern penitentiary, and am satisfied that kind and humane treatment of prisoners is the best.

Treat crime as a disease and the criminal as a patient. Hence, room, light, air, and judicious labor. Banish the idea of mere punishment and a machinery system of treatment. Study dispositions and graduate the penalties and premiums.

Start with the idea that those in prison are not the only criminals, the difference between detected and undetected criminality being very slight. Appeal to the manhood and womanhood of your prisoners, and do nothing to break the spirit of self-respect. Place first the reformation of the criminal; secondly, protection of the community; and, thirdly, opportunity for restitution for the wrong committed. Abolish all time sentences. As we would prescribe for a sick person until he was restored, and cease giving medicine to one who has recovered, so should we release the prisoner when reformed and safe to go abroad, and withhold discharge when not cured and when unsafe to be out. As it is now, the unreformed can claim discharge when the time has expired, and they are almost certain to return to their criminal pursuits; while, on the other hand, the law holds the penitent and reformed long after they may be worthy of another trial.

If it is objected and you say that this will cause hypocrisy, I reply, if the prisoner should be discharged after a committee had watched and tested his conduct, under the plea of reformation, it will be an evidence that it *pays to be good*, and if he go on all his life pretending to be good, the community will be safe and his pretense become a reality.

May you feel drawn to devote some time to the very important work *preceding prison life*. It is not enough to care for the prisoner while in prison, nor, indeed, after his discharge; we must have a constant care to prevent prisoners being made. Take care of the erring before the error leads to prison.

With my kindest regards, yours, cordially,

ALFRED H. LOVE.

12. A NOBLE TESTIMONY.

*Letter from Rev. C. C. Foote.*DETROIT, *January* 11, 1873.

MY DEAR FRIEND AND BROTHER: I am in receipt of your invitation to attend the Prison Reform Congress at Baltimore, for which I thank you.

What a glorious congress we had at Cincinnati. May yours at Baltimore excel it in glory. How happy should I be to be with you. But my labors for this world are apparently finished. For the past nine months I have been a helpless invalid. I put my very life's blood into my four years' chaplaincy in the Detroit house of correction. Blessed years of precious fruit and fatal toil! The field was so constantly whitened for the harvest that it seemed impossible to avoid over-labor. I know of no place so hopeful for winning men and women back to the knowledge and service of God as a properly conducted prison.

May Heaven hasten the day when the *radical reformation* of unfortunate criminals shall be the first and highest aim of our prisons, rather than the saving to the community of a few paltry dollars. "This," said the great Teacher, "ought ye to have done, and not to leave the other undone."

With high esteem and true affection, yours, &c.,

C. C. FOOTE.

Rev. E. C. WINES, D. D.

IV.—REPORTS ON THE PENAL, REFORMATORY, AND PREVENTIVE INSTITUTIONS OF STATES AND TERRITORIES.

1. CALIFORNIA.

By Rev. James Woodworth, corresponding secretary of the California Prison Commission.

The extreme length of the State of California is about eight hundred miles, and the width from one hundred and fifty to two hundred and forty miles, with a coast of nearly one thousand miles. The number of inhabitants is probably over 600,000. Though young in years, with a small population in proportion to its size, yet having a water-front, with so vast an extent of country lying back of it, and looking out, through the Golden Gate, directly across the sea, to Japan, China, India, and Australia, with its fertile soil, its wondrous climate, and its inexhaustible stores of mineral wealth, California is destined, at no distant day, to equal in importance, commercially and otherwise, the most favored States of the American Union. This importance will extend to social and moral, as well as material, interests.

Such being the position and prospective power of California, her influence will extend over the whole of what is known as the Pacific coast, embracing nearly all the country lying west of the Rocky Mountains. Of this entire territory, California must take the lead. The character of her institutions, including those which look to the prevention and repression of crime, must, to a great extent, impress itself upon the institutions of her neighbors. This is already becoming apparent; unpleasantly so, too, for while endeavoring to pattern after us, a want of due discrimination causes them to copy our defects as well as our excellencies.

This State was at first little more than the mere camping-ground of adventurers, who had come here only for a temporary sojourn. The consequence was that almost everything was temporary in its character, being designed merely to meet the needs of the actual present, with little thought or regard to what should be afterwards. In hardly anything was this more apparent than in the provisions for punishing crime, so that before any regular system had been thought of, the plan adopted had become so expanded that it was difficult to change it.

Nevertheless, important reforms have already been inaugurated. Our criminal laws and judicial system have been greatly improved. Our penal and civil codes, the result of four years' labor by a commission appointed to prepare them, have already received high praise from jurists fully competent to form a judgment of their merits.

Our penal institutions are a state prison, a jail in each of the fifty counties into which the State is divided, a city prison and jail in San Francisco, and station-houses or lock-ups in the principal cities. There is no central or general authority, charged with the administration of our entire prison system. The state prison, the most important of our penal establishments, is managed by a board of directors, consisting of the governor, the lieutenant-governor, and the secretary of state, all constituted directors by their office. The board has no official connection with any other penal or reformatory institution in the State. The members are all elected at the same time for four years; and, as a matter of course, their terms of office expire together. Each receives as state-prison director \$75 per month. The law gives the directors full power to create and fill offices, to fix the salaries of officers, to remove them at pleasure, to let the labor of the convicts to contractors, and, in short, to do whatever they may think necessary or expedient for the good of the institution. These powers are not suffered to rust for want of use. They are exercised to the fullest extent, so that an entire change of the prison staff follows every change in the political complexion of the board.

Though the lieutenant-governor is not made *ex-officio* warden by the statute, yet, as no salary is attached to the office to which he is elected, and as his duties as president of the senate occupy but a fraction of his time, the custom of making him warden, or "resident director," has become a settled one; so that an election to one office is virtually an election to the other. This the law indirectly contemplates by providing that he shall be "paid the sum of ten dollars per day for each day's services rendered for the performance of any duty at the state prison."

In the early history of the State the convicts were, for a short time, kept in a hulk known as the "prison brig." As the number increased and additional accommodations were needed, a prison building was erected. The security of the convicts being at that time considered the main thing, the prison was built between two ranges of hills, affording excellent facilities for guarding the inmates by means of cannon planted upon them, which swept the entire grounds. The only disadvantage of this locality is that it prevents any extension in the direction of the hills, and compels every enlargement to be made on a line parallel to them. With this exception, a more desirable site could hardly have been selected. The prison originally consisted of one stone building, 180 feet long by 28 wide, and one story high. It is said to have contained at first but one room, into which were crowded three hundred prisoners. It has since been divided into rooms and another story added. Other cell-buildings, workshops, offices, &c., have been constructed from time to time, but so irregularly that the additions have made it a mass of patch-work.

The prison is situated at Point San Quentin, twelve miles north of San Francisco, on an indentation of the bay of that name, and within three miles of the popular watering-place of San Rafael. The location is both healthy and beautiful. It is surrounded by some of the finest scenery of the coast, forming a panorama of rare magnificence, the value of which, in its elevating and refining influences even upon men who are imprisoned as felons, can hardly be exaggerated. The prison premises embrace about one hundred and thirty acres, most of the land, how-

ever, being of little value except for grazing. The prison grounds proper are surrounded by a wall 25 feet high, forming an inclosure of some six acres. Within this inclosure, besides a great number of other structures, there are three prison buildings, one of which has common dormitories. The other two have an aggregate of four hundred and twenty cells, each 9 feet long, 4 feet wide, and 8 feet high, designed as the dormitory of a single prisoner, but often receiving two. Each cell is supplied with a bunk, a straw bed, two blankets, a night bucket, and such other articles of convenience or luxury as the taste of the occupant may suggest and his ability enable him to buy.

On the hills flanking the prison are immense reservoirs, one of which, now in process of construction, will, when completed, hold 250,000 gallons. Through it the prison will be supplied with pure mountain-water by an incorporated company.

The prison staff consists of sixty-three persons, and their salaries aggregate \$50,340 per annum, over and above the supply of the warden's table and the board of the other officers, making together more than one-third of the entire yearly cost of the establishment.

The industries carried on are the manufacture of furniture, saddles, harness, wagons, and boots and shoes; to which is added, in summer, brick-making. These give employment to about five hundred and forty men, whose labor is let to contractors at 40 cents a day. The average number of prisoners is about 900, two per cent. of whom are women. The chapel will seat five hundred persons. It has a handsome pulpit and sofa, and an excellent cabinet organ, all purchased with money contributed by the prisoners. The organ is played by one of themselves. There is no regular chaplain, and never has been. Public worship, however, is held every Sunday, conducted by ministers of different denominations from San Francisco, who volunteer their services. All the prisoners are permitted, though none compelled, to attend. About three hundred are usually present. The prison choir is composed of convicts, who perform well that part of the service.

After divine service the prison school is convened, in which one hundred and fifty to two hundred prisoners are instructed in the elementary branches of an English education by some of the better educated of their own number. During the first eighteen months of the existence of the school one hundred and eighty prisoners were taught to read and write, and though many of them had been discharged, not one had come back to prison. When the school closes, some twenty of the prisoners, who profess to be striving to serve the Lord, meet for prayer and conference, and an hour is spent in those exercises.

The prison library contains about 3,000 volumes, and is well patronized, 1,600 books being taken out every month. Occasionally the prisoners have an entertainment of their own, which consists of readings, recitations, and compositions prepared by themselves. Once in a while, also, a familiar lecture is delivered to them by some person invited to that service, professors in the State University sometimes visiting the prison for this purpose.

Formerly the principal means of discipline was the lash. This is now not often used. The punishments at present employed are loss of time gained under the commutation law, the dark cell, a reduced diet, and the shower-bath applied by means of a hose and nozzle. The commutation law allows the convict a credit of five days for every month of good behavior for the first two years, and an additional day during each succeeding two years up to ten, after which he gains ten days per month. This law has worked admirably, and has very much reduced the neces-

sity for actual punishment. Aside from this, no rewards are given for good conduct.

Every convict, if without clothing of his own, is supplied, on his discharge, with a suit by the State, consisting of a coarse shirt, a pair of pants, a woolen jacket, a pair of brogans, and a cheap hat; and, in addition, \$5 in money are given to him.

The prisoners' food, though plain, is of good quality and in abundant quantity. On Thanksgiving and Christmas a sumptuous dinner is served to them, which is usually provided by the benevolent citizens of San Francisco through a committee of the California prison commission.

The sanitary state of the prison is good. Only eight deaths occurred last year, being a little less than one per cent.

The expenses of the prison for the past year have been \$166,790, and the earnings \$67,650, leaving a deficiency of \$99,140.

The fees allowed the sheriffs for the transportation of prisoners after conviction are 50 cents per mile for a single prisoner, and 25 cents for each additional prisoner. It thus costs, to get a convict to the prison from some of the more remote counties, \$260. The entire cost of transportation for the twenty-second fiscal year of the prison was \$19,997.50, or about \$72 per prisoner.

The governing authorities of the county jails are the boards of county supervisors, but the sheriffs of the counties, elected for two years, are in immediate charge. These appoint their deputies, so that change is as much the order of the day here as in the state prison.

The prison accommodations of San Francisco are not sufficient for its needs. The city has two prisons—a police prison and a city jail. The police prison is in the basement of the city hall. It is damp, dark, ill-ventilated, and greatly overcrowded. The city jail is a substantial and handsome building, but quite too contracted in dimensions for present necessities. Sixteen Chinamen have been confined in a cell 10 feet by 8, with a ceiling only 8 feet high. The necessity for such cruel overcrowding has been, in some degree, obviated by the erection of a small additional building in the yard of the jail. A house of correction has been resolved upon, which, when built and in operation, will afford all the relief required for the present.

There can be no doubt that our prisons themselves are schools of crime. Many are made confirmed criminals by being sent there, who, in all probability, would not become such if, while undergoing their punishment, they could escape the moral contagion with which these places abound.

There is but one reformatory for juveniles in the State. This bears the name of industrial school, and is situated in the immediate neighborhood of San Francisco. The average number of inmates is two hundred and fifty, all boys. The school has a farm of one hundred acres, which gives employment to quite a number of the children. Others are engaged in shoe-making, tailoring, and household duties. A good many are too young to labor. The forenoon is devoted to work, the afternoon to study, and the evening to music, vocal and instrumental. There is a band composed of thirty boys, one of their number acting as leader. The punishments are severe whipping with a cowhide or leather strap, standing in a stooping posture on a wooden box or iron safe, dark cell, &c. Escapes are frequent. Recently thirteen got away within a fortnight. The history of the institution for some years past has been deplorable; but details would scarcely be to edification.

Of preventive measures in operation among us I place first the earnest, prayerful efforts of Christian men and women; and chief of all the

influence of wise and godly parents. Next are the preaching of the word, the Sunday-school, and other agencies for giving effect to the gospel. Closely following these are public and private schools. Our orphan asylums, where the lack of parental culture is, to a great extent, supplied, are greatly preventive of crime. So is the Ladies' Protective and Relief Society, with its "home," in which one hundred and seventy-three children, though not orphans, are cared for and educated. Temperance societies, young men's Christian associations, and the various other benevolent agencies with which our State, and particularly the city of San Francisco, abound, are all doing their part in this great preventive work.

Little or nothing is done for the aid of discharged prisoners, except by the California prison commission, an institution organized in 1865, with this as its primary object. Its office is in San Francisco. The general agent gives his whole time to the work. He visits regularly the city prison and county jail here, and the state prison at San Quentin. This he does, not only to converse with and counsel their inmates, but also to learn their purposes and necessities, so as to be better prepared to deal with them when, on their release, they call upon him at his office. Having myself occupied the position for nearly five years, and having been ever since familiar with the operations of the association, I am prepared to speak in emphatic terms of the success of the agent's efforts. The number of discharged prisoners variously aided by him during the past year was 462; the number of prisoners aided with legal counsel, 116; aided by mitigation of punishment, 70; discharged through his interposition, 46; aided with board and lodging, 101; helped with small sums of money, 198; supplied with clothing, 8; furnished with means to leave the city, 141. The whole number of prisoners conversed with, counseled, and in some way aided, materially or morally, was 1,387; whole number of interviews had with these, 2,827.

2. CONNECTICUT.

By Rev. J. K. Fessenden, secretary of the Connecticut Industrial School for Girls.

I. *Preventive institutions.*—By these are meant institutions designed exclusively for children under eight years of age, who, by the death, abandonment, incompetency, or vices of their parents, are thrown upon society, but in no proper sense to be regarded as criminals. Of these there are four Protestant orphan asylums, open to children of every nationality and faith. The first was established by ladies at New Haven in 1833. Commencing without funds and in a very humble way, its assets now amount to \$36,500, with several large legacies in prospect. There are now one hundred and twenty-six inmates, more than one-half of whom are of American parentage.

Next to this a similar institution was established at Hartford, which has about the same number of inmates, and is already the recipient of large donations and legacies.

Third in order is the Bridgeport asylum, which is of recent origin. It was designed especially for the children rescued from the city almshouse.

The fourth is a small family-home for poor children. This was started by, and is under the control of, a benevolent lady in Danbury.

All these institutions are private charities, under the management of boards of women, and are accomplishing a great amount of good.

There are two Roman Catholic orphan asylums, designed exclusively for the children of Catholics. They are at New Haven and Hartford. Respecting them, I have been able to obtain no definite information.

During the late civil war much interest was excited in behalf of the children of soldiers killed in the service of our country. An association was formed for their care, to which was given a home at Mansfield. Its noble-hearted and Christian donor devoted himself to its superintendence during his brief life, with the sole reserve of a bare maintenance. The school was opened in 1866, and up to 1st of June, 1871, had received one hundred and thirty-two children, of whom sixty-eight were admitted during the past year. It is supported largely by the contributions of the common and Sabbath-schools of the State, aided by donations from other friends, and by an appropriation of \$1.50 per week for each inmate.

A similar, though smaller institution, was established at Darien by the liberality of a wealthy gentleman, who has largely contributed in various ways to its support.

Of late there have been several other charitable institutions started at Hartford and New Haven, which cannot fail to be preventives of crime. I refer to associations for the aid of the poor, under the care of the city missionaries, and also to reading and refreshment rooms for news-boys and laboring men. There has also been established at Hartford a boarding-house for respectable young women, where they can find homes at a moderate cost and enjoy the associations and benefits of a respectable and virtuous home.

II. *Reformatory institutions.*—These are the State Reform School for Boys, at West Meriden; the Connecticut Industrial School for Girls, at Middletown; and the Home for the Friendless, at New Haven.

The State Reform School for boys was established in 1854. It is a State institution, created, owned, and, through a board of eight trustees, controlled by the State. It has a valuable, well-watered farm of one hundred and sixty-three acres, which has become one of the model farms of the State. The institution has ample accommodations for three hundred boys, with model dormitories, school-rooms, workshops, chapel, offices, and all the modern appliances for the proper care and discipline of the inmates.

The barn and other out-buildings are substantial and convenient, and the stock of the farm very choice and valuable.

The system on which the institution is conducted is that known as the congregate, in distinction from the family plan. It is so administered as to be pervaded by a spirit of wisdom and kindness—by the mingling of authority with constant appeals to the intelligence, the best convictions, and the noblest aspirations of the boys who are gathered under its care; every day the family of the superintendent and the boys unite in morning and evening devotions, accompanied with the inspiring singing of hymns and with such advice as its gifted superintendent thinks proper to impart. God's providence and goodness are recognized in the convocations for morning and evening prayer, and at each successive meal. For several hours every one daily attends one of these graded schools of the establishment, under the general care of the assistant superintendent, who from the beginning has managed this department with conscientious devotion and consummate ability, and who has all the assistance needed in his work. Several hours are each day devoted to labor on the farm or in the

workshop, under the direction of skillful overseers, and with all the necessary stimulants to skill and industry. The food and clothing are, both in quantity and quality, all that health and comfort require; cleanliness is exacted, and order and unhesitating submission to authority enforced by special religious services on the Sabbath, and by a constant reference at other times to the laws and claims of God.

More than eighteen hundred boys have been connected with this school during the nineteen years of its existence. The limit of their age is from eight to sixteen. Originally none could be sent to the school who were not convicted by the justices of the peace or some criminal court of an offense punishable by law. But since 1869 many have been committed under the truant law.

The results—financial, moral, and social—of this school are believed to be as favorable as those of any other institution of the kind in the United States. The superintendent believes that three-fourths of the boys become as respectable, virtuous, and useful men as the average of the common classes of society.

The counterpart of the boys' reform school is the Connecticut Industrial School for Girls. This is in the beautiful town of Middletown, on a finely situated farm of forty-five acres, a mile and a half from the center of the city. This site was the generous gift of the town, at a cost of \$11,500.

Unlike the boys' school, this institution is a private charity, incorporated by the State and employed by it to take charge of the viciously-inclined young girls who may be sent there. For this service the State stipulates to pay \$3 per week for each girl thus sent. Unlike the boys' school, too, this is organized upon the family plan, with houses having accommodations each for thirty girls.

The school has been in operation three years, and has received one hundred and sixteen inmates, of whom eighty-one still remain. The distinctive features of this school may be thus concisely stated:

1. Its name is the *industrial*, not the *reform*, school for girls.
2. Its *proper* subjects are *viciously-inclined girls*, between the ages of eight and sixteen years. They are not simply orphans, or the neglected and foundling, nor yet are they those who, as a class, have fully entered upon a course of vice and crime. They are rather neglected and abandoned children, thrown out, from whatever cause, upon the wide world, friendless, ignorant, and under the depraving and debasing influences of abject poverty and vicious associations. Sixty per cent. of them are wholly or in part orphans. More than 75 per cent. are the children of drunkards and criminals—of abandonment and prostitution. Most of them were paupers, beggars, vagrants, petty thieves, and too many of them have already been drawn into the society, if not the practice, of lewdness.
3. They are regarded and treated by the law of the State, not as criminals to be convicted and punished, but as ignorant and exposed children—as sinned against rather than as sinners, and as such to be pitied and educated. The State stands in the place of a common parent, and, as such, cares for them where their parents or other natural guardians are dead, or are incompetent or unwilling properly to train and educate them. Upon due evidence of this fact, the State intrusts these children to the care and guardianship of the directors of the industrial school till they are eighteen years of age, with the power to restore them to their natural parents, to bind them out, or to intrust them to adopting parents, or suitable guardians.
4. At the school the aim is to bring the girl at once under the nearest

possible approach to the influences of a well-regulated Christian family, with its household worship, sweet songs, its motherly watchfulness, and its pious counsels and steady and gentle but firmly authoritative and constant training. All in turn are taught the duties of the household—to wash, to iron, to cook, to sew, and to give to everything a look of tidiness.

5. Careful attention is given to scholastic and religious culture and thrift and training; but it would occupy too much space to go into detail upon these points.

6. A residence at the school is not to be too long protracted—not longer than is needed to fit the girl for a useful residence in a private family, and the almost equally difficult task of finding a family that will be willing to take a friendless and often froward girl, and seek as earnestly to complete the good work begun as to obtain her labor at the lowest possible cost.

7. It is designed to leave the door wide open at all times for the girl's return to the school if, for any cause, such a return is thought best, and to follow those who have gone from it until there is reason to believe that they are beyond the need of its guardian care.

There is promise of the best results, but it is too soon to speak with confidence on this point.

There is a third reformatory institution, viz, the Home for the Friendless, at New Haven. This is designed for friendless, outcast, and neglected women of every age and condition. The Industrial School could not receive those who were far advanced in a life of crime. Hence Christian women sought to provide for all such a refuge whenever they were disposed to turn from their evil courses. Here, they say in one of their reports, "from the hospital the convalescent, from the jail the culprit, from the alms-house the friendless, find a gateway through which they can enter the higher and purer paths to virtue and independence." For this purpose they have purchased and fitted up a comfortable dwelling a few miles from the city. It is under the care of a board of ladies who superintend all its concerns. The charity of the benevolent has thus far abundantly supplied them with the funds needed for their work, and in many cases they have had the joy of knowing that their work of love has not been in vain.

III. *Penal institutions.*—Of these there are three classes, the town work-house or house of correction, the county jail, and the state prison.

The several towns have power to establish work-houses or houses of correction, to erect and provide suitable buildings, with cells or apartments for the confinement of offenders sentenced thereto, and to compel the labor of the inmates. These are under the care of the selectmen, who appoint the keeper and regulate his pay. It is a sad fact that in these town-houses are frequently found, indiscriminately mingled, the virtuous and friendless poor, the demented, the imbecile, and the miserable tramps, vagrants, and drunkards, who infest the streets, and steal their living so long as they are able, and then perhaps apply to the town-officers for a brief shelter. With these, too, are found the refuse of the towns and cities, sentenced there, time after time, for sixty days, for drunkenness, prostitution, and petty thefts. This class of institutions are a disgrace to the State, and will continue to be so, until their true character and their enormity shall be brought to light by a careful official investigation, and remedied by the strong arm of State authority.

The second class of penal institutions is the county jails. Of these there are eleven, or one for each of the county towns. As their names

indicate, they are county institutions, built, owned, and managed exclusively by the counties. The result of this is a great want of uniformity in their construction and management, and as great a difference in their general character. They are used only as places for the detention of persons committed for trial or convicted of minor offenses.

Full returns are made yearly through the county commissioners to the secretary of state of the number, color, sex, age, and nativity of the prisoners, as also of their social condition, habits, education, causes of commitment, method of discharge, and of the receipts and expenditures of each jail, an abstract of which is submitted to the legislature. From this we learn that there were committed to the jails during 1871 two thousand seven hundred and forty-five persons. The average number confined was three hundred and thirty. Of these, five-sixths were males, thirteen-fifteenths of foreign birth, more than half were committed for drunkenness, and only one hundred and forty-seven were strictly temperate. In most cases there is no other separation of the prisoners than that of the sexes. There is no provision made by law for their secular instruction, and but little if any given. The jail in New Haven is of modern construction, and is the only one in the State which is in any respect what it ought to be. In Fairfield and Hartford Counties new buildings are in process of erection on the most approved models.

The character and influence of our jails is thus sketched by the special commission on the state prison in their report to the legislature of 1872:

Many of our jails and houses of detention for the idle and vicious hold about the same relation to the state prison that the common schools do to the colleges. We cannot now enter into the sanitary condition of our jails and work-houses, though we are certain that it is bad enough in most of them. But we call your attention to them as nurseries of crime with regard to the state prison. In the poor-houses the innocent poor are brought into contact with the abandoned and profligate; and those who have only slightly and for the first time, perhaps, departed from the way of decency, associate with those skilled in crime and hardened in shame. In the jails those committed for trial, charged with a first offense and presumed by the law to be innocent till proved guilty, and those young in sin, have opportunities of association with the vilest and most abandoned criminals, and the result in both cases is deplorable. The minor jails are not simply *feeders* of the penal prisons, but they offer *uncommon facilities* for the production of criminals. There are jails in this State which are as wisely and humanely managed as is possible under our prison system, or rather our want of system. But we are convinced that the jails and poor-houses of this State need a thorough examination, and that it is time that we had a comprehensive system for all such institutions.

3. *The State prison.*—From 1773 to 1827, the State prisoners of Connecticut were immured 60 feet under ground in an abandoned copper mine at Simsbury. The prison was known as the Newgate of Connecticut. The history of that long period is one of the saddest proofs of the barbarities then practised by Christian States upon the criminal classes.

In 1826 the present state prison at Wethersfield was built, and in 1827 was placed under the superintendency of Moses Pilsbury, with the assistance of his son Amos Pilsbury, now of Albany. The latter succeeded his father as superintendent in 1830, and remained in that position for fifteen years. There is scarcely to be found in the history of state-prison management a brighter record than that of these years under these remarkable men. The Connecticut state prison became the model institution of the United States, and was assigned the first place in the report to the French government of the distinguished French commissioners on prisons, de Tocqueville and de Beaumont, in 1830.

This pre-eminence, however, has long since passed away. A new order of things in respect to prison discipline has dawned upon the world, and

has greatly modified the systems and management of other States, while in Connecticut they have remained essentially the same.

The very able report of the commissioners of 1872, which has been already cited, makes the following statements:

The commissioners entered on their work in the belief that the present prison might be so repaired and modified as to suit modern ideas, but they were brought to the decided conclusion that the State needs a new prison on a more favorable site, and constructed on an entirely different principle and scale. Among the reasons given for this conclusion are the dilapidated condition and utter inadequacy of the present buildings; that there are no suitable accommodations for the officers; that there is no suitable drainage of the premises; that the cells are too small and admit of no ventilation, and many of them damp and unwholesome; that a proper separation of the sexes even is now impossible, and, indeed, cannot be secured in the same prison. While they would retain the present silent system, they would greatly modify it. They recommend the construction of a new prison which shall admit of a proper grading of the prisoners, the discontinuance of the parti-colored prison-dress, the cropping of the hair, and, indeed, everything which disregards the manhood of the prisoner and extinguishes hope. They would treat him as a man and a brother, though erring and fallen and degraded.

The industries pursued are shoe-making, the manufacture of carpenters' rules, and the burnishing of silver ware. The gross earnings of the last year were \$26,399, and the ordinary expenses were \$23,187, leaving a balance in favor of the State of \$3,212.

Religious and educational agencies are employed to a limited extent in the discipline of the prison. A chaplain is employed, who conducts religious services daily and also upon the Sabbath, in which he reports most of the prisoners manifesting a commendable interest. A Sunday-school is held every Sabbath afternoon, and the men are visited during the week by the chaplain in their cells. Much interest was awakened last year by addresses on temperance, made by members of the Good Samaritan Association, of Hartford. Secular instruction is given in the evening to a few prisoners in their cells.

The commissioners recommend that the new prison shall have every needed facility for the mental and religious instruction of its inmates.

Prisoners have the power of shortening their terms of sentence by good conduct, a measure which has shown itself useful both in a disciplinary and reformatory point of view. No provision for discharged convicts is made beyond that of giving them a suit of clothes and \$10 in money on their liberation. Reform is urgently needed in this direction, either through legislation or private benevolence.

3. ILLINOIS.

By Rev. Fred. H. Wines, secretary of the Board of State Commissioners of Public Charities.

The prison system of Illinois may be said, as in all the Western States, to be still in its infancy; and although a new State has one great advantage over those which are older in the opportunity thus afforded of profiting by the experience of those who have trodden the path before us, we cannot in Illinois boast of having improved our opportunity, in so far as relates to the laws and usages of prisons. The reason probably is found in the existence of an almost universal apathy and indifference upon the subject. The reformation of criminals is regarded as a hopeless undertaking. The substitution of district prisons for county jails is resisted by those who depend in part for their income upon the profits

of jail-keeping. The result is, that any intelligent, systematic effort at the introduction of labor into prisons designed for criminals of the lower grade, or at intellectual or moral culture of criminals of this class, is at present impossible. In presenting the following brief sketch of the prisons of the State, therefore, my only object is to state what is, not to depict what should be. For the realization of the desired reform in our prison system we may be compelled to wait many years, until persistent agitation and the advance of popular intelligence have accomplished their work. Reform, at some time, is certain.

The county jails.

There are, in this State, one hundred and two counties. In nearly all of them, at the county-seat, there is a jail, varying in size from a single cell to fifty, and in cost from \$1,000 to \$90,000. A dozen of our jails, at least, have cost over \$20,000 each. Nearly one-fourth of the whole number probably are substantially and handsomely built, commonly of stone, and are furnished more or less fully with approved appliances for heating, ventilation, sewerage, and bathing. Of the remainder, some are under-ground dungeons in the basements of court-houses or of sheriffs' residences; some are old-fashioned block-houses, sheathed on the inside with iron; some are iron cages, set like safes for moneys and valuable papers, in the entry or in the upper story of the jailer's house; some are virtually privies, placed over open vaults, whose noxious gases circulate through the cells and corridors above without let or hinderance. Most of them are very small, and it is a pleasure to be able to add that many of them are nearly always empty. The number of prisoners in confinement at any one time in Illinois is never large, if we except the convicts in the penitentiary.

The following extract from the (unpublished) report of the board of charities will furnish a somewhat fuller account of the jails of this State:

Our deliberate judgment is, that the practical value of jails, whether as means of prevention or of cure of crime, compared with their great cost, is very trifling. We find, upon inquiry, that others have arrived at the same conclusion before us. In fact, this opinion is shared by nearly all who have given the subject any attention. Probably no other equal expenditure of public money is equally unprofitable.

In the first place, the county jails of Illinois, as of other States, are for the most part badly planned, if not badly built. Some of them are very unsafe; and but for the vigilance of the jailers in charge, escapes would be an every-day occurrence. They are unsafe, either through the weakness of some particular portion of the structure; or on account of the facility of communication in them, among the prisoners, and even, in many instances, with the outside community; or because they afford no adequate protection to the turnkey against sudden assault.

Others are as secure as any jail can be made, but are wholly deficient in the essential conditions of life and health. They have ordinarily no sewerage; they are illy ventilated, or not ventilated at all; they are very imperfectly lighted; some of them are destitute of any means of warming the air in winter, and scarcely any of them have proper provision for bathing by the prisoners.

A jail may be safe and comfortable, and yet be so constructed as to render the classification of prisoners impossible. There is not a jail in the State in which the accused are separated from the sentenced. Witnesses are often, but not always, confined in a separate apartment, known as the "debtors' prison." In some of the jails there is no means of separating the sexes; in others, the only separation is by cells, opening into a common corridor; in others, female prisoners are confined in the debtors' prison; in others, a female department has been extemporized in the sheriff's private residence, by sheathing an ordinary window with sheet iron; in a few, the female prison is properly planned and built. The number of witnesses and women, however, in confinement in this State, at any one time, is very small.

As to the internal management and discipline, generally, there is not much occasion for complaint. We are satisfied that where food is so abundant and cheap, the temp-

tation to stint prisoners in their diet is wanting; and in many counties they are fed from the jailer's own table; many counties even furnishing clothing, in extreme cases, at public expense. The jails are not always as neatly kept as they might be, and personal cleanliness on the part of the inmates is not sufficiently insisted upon. In some cases, a little more care to provide reading matter would be commendable. But in all our experience, we have found no evidence or intimation of personal cruelty to prisoners.

There are two particulars, and these of paramount importance, in which the very best jails in the State are as objectionable as the worst. We refer (1) to the hourly intercourse of prisoners with each other, and (2) to their lack of any useful, honorable employment. It is this *association in idleness*, which is the curse and condemnation of our present jail system.

Confinement in separate cells is a partial but very imperfect barrier to association; because communication between the cells is not impossible, and communication in the corridors is generally allowed, to a certain extent. It is also customary to place from two to six prisoners, when necessary, in a single cell, on account of the want of sufficient room in the majority of jails.

The effect of association is to increase the number of criminals, and to develop their criminality. The innocent and the comparatively innocent are corrupted by the example, the conversation, and the direct teaching of more experienced transgressors. The lessons taught in county jails are, contempt for authority, human or divine; hostility to law and to its officers; the delights of vicious indulgence; the duty of revenge upon society for imaginary wrongs; the necessity of violence, of daring, and of sullen submission to punishment; the hopelessness of all effort at amendment; and the best methods of success in criminal undertakings. Past exploits are here recounted; future deeds of darkness are planned. The history and character of noted criminals and of well-known officials are discussed. Lewd songs and conversation, profanity and ribald jests, fill up the day. In many jails card-playing is freely allowed. In a few, liquor is not absolutely prohibited, provided that the prisoner ordering it is able to pay liberally for the indulgence. Every jail is a school of vice. More than one hundred of such schools are maintained in Illinois, at public expense; and the public furnishes an education in crime, at its own cost, annually, to hundreds of criminals, in this State alone. We admit the necessity for prisons; but are we not right in asking whether prisons of this particular class do not work as much harm as good to the community?

But the evils of promiscuous association are enhanced by the universal reign of idleness in county prisons. This idleness is compulsory; it is a necessity of the situation. The State appoints as the presiding *genius loci*, the mother of all villany, instead of labor, the mother of every virtue. No policy could be more shortsighted.

Idleness, in prison, is a premium upon crime. Multitudes of men commit larceny every autumn, simply to secure, free of cost to themselves, comfortable board and lodging, with agreeable company, through the winter months. They do not dread the confinement, and care nothing for the disgrace.

In enforcing idleness, the State voluntarily relinquishes the most effective means both of the punishment and of the prevention of crime. What makes men criminals? In nine cases out of ten, it is aversion to labor, and the conviction that a life of crime is easier and fuller of enjoyment than a life of industry. Make labor compulsory in all prisons, and the prison at once becomes a terror to evil-doers. Confinement at hard labor is to the majority of criminals the severest possible punishment. But the present system ignores this most obvious truth.

The physical and moral effect of protracted idleness upon individuals is deterioration. The muscles become flaccid, lymph accumulates, the nervous system loses its tone, the will is enfeebled, the moral nature is depraved; and at the expiration of his imprisonment, the offender goes forth, to recommence his criminal career, with his power to earn an honest livelihood and to resist temptation diminished instead of augmented.

These facts are well known to all county officials, and give rise to much lamentation on the part of all sensible men who have the cause of public virtue at all at heart. One of the worst effects of the present system is its influence upon circuit and county judges, in inducing them, against their own inclination, to sentence men for the shortest periods, when justice demands a maximum sentence, instead. But a judge inevitably thinks of the cost to the county of protracted imprisonment; he knows its futility; and he asks himself, what is the use? The consequence is, that crime is not adequately punished; transgressors are emboldened; crime increases; and too often an outraged community takes the administration of justice into its own hands. This is the origin of lynch law, that blot upon American civilization. Lynch law is nature's own remedy for weakness in the criminal administration of any government.

The penitentiary.

The Illinois State penitentiary, at Joliet, is one of the largest and most magnificent structures in the United States. It is constructed on

the plan of a center building with two wings, and the necessary shops are in the yard. The number of prisoners averages about twelve hundred and fifty, of whom, perhaps, twenty are women. The cellular system is followed, in the arrangements for eating and for sleeping, but the labor is on the congregate plan. Solitary confinement during the term of sentence is resorted to in the last extremity as a punishment for the incorrigible refractory. The branches of labor pursued are cigar-making, cooperage, the manufacture of shoes and harness, and also of butts, and stone-cutting. For stone-cutting and quarrying, the immense fields of stratified limestone, at Joliet, afford peculiar facilities. The new state-house now building at Springfield is constructed of this stone, and the cutting is done by the inmates of the penitentiary.

The average sentence of convicts at Joliet is about three years. Seventy criminals have been sentenced to imprisonment for life in Illinois during the past seventeen years; of whom seven died in prison, one was sent to the insane asylum, and twenty-three have been pardoned, after serving for a longer or shorter time, as shown in the following statement:

Three served 1 year; 2 served 2 years; 4 served 3 years; 2 served 4 years; 1 served 5 years; 6 served 6 years; 2 served 7 years; 2 served 8 years; 1 served 10 years—23 served, on an average, less than five years each.

Of the thirty-nine life convicts still in confinement, 2 have served 11 years; 1 has served 8 years; 2 have served 7 years; 5 have served 6 years; 6 have served 4 years; 7 have served 3 years; 6 have served 2 years; 3 have served 1 year; 7 have served less than one year—39 have served, on an average, about three and one-half years each.

About four-fifths of the commitments are for crimes against property, and one-fifth for crimes against the person. About one-fourth of those committed are foreigners. The ratio of foreign convicts to the foreign population of the State is no larger than that of native convicts to the native population, one-fourth of our entire population being foreign-born.

A library of three thousand volumes has been provided for the use of prisoners. A school, numbering two hundred or two hundred and fifty, has been organized, and a teacher employed. Religious services are held in the chapel on the Sabbath, and the chaplain visits the men nightly in their cells.

For many years this penitentiary was leased by the State to the highest and best bidder. A few years ago the system of leasing was abandoned, and the discipline and financial management on behalf of the State were placed in the hands of the warden, subject to the direction of a board of commissioners. On the 1st of December, 1870, the indebtedness of the institution was stated by the warden at \$332,832.18. The general assembly, after making an appropriation for the payment of the existing indebtedness, authorized the leasing of the *labor* of the inmates, retaining the general management and discipline in the hands of the prison officers, and the result is that during the past year, for the first time in its history, the penitentiary has earned \$35,000 or \$40,000 above the actual expenses.

The State reform school.

At Pontiac, on the Chicago and Saint Louis Railroad, a State reform school has been established, which was opened June 1, 1871. One hundred boys have been received as inmates since that date.

The reform school of Illinois differs from similar institutions in other States, in the light in which it is regarded by the supreme court, namely, as a *prison* for juvenile offenders. No boy can be received except under sentence of a court, nor can any boy be retained during his minority, but all must be discharged on the expiration of the sentence. All the inmates have been committed for high crimes, and for periods varying from one month to ten years. The average sentence is one year and nine months. Under the decision of our supreme court, the institution fails to meet the design of its originators and best friends; but the internal discipline is like that of a reform school, and the authorities are allowed to discharge boys on ticket-of-leave.

Discharged convicts.

No agency exists in this State for the aid of discharged convicts, nor is there any voluntary society to take the place of a State agency.

*Central oversight.**

Illinois has a "board of public charities," charged with the duty of annual visitation and inspection of all county jails and almshouses within her borders, but the commission has no authority or power beyond that of inspection and report.

4. INDIANA.

By Charles F. Coffin.

The State of Indiana was admitted into the Union in 1816. The population was then small, probably not exceeding 20,000. Most of its territory was thickly covered with trees, and the labor of clearing and rendering it habitable was great; hence its progress for several years was slow. Its inhabitants were mostly farmers, crime was rare, and punishment speedy and of a primitive character. By a statute of 1807, horse-stealing, treason, murder, and arson were punishable with death. Whipping might be inflicted for burglary, robbery, larceny, hog-stealing, and bigamy, also for striking a parent or master. Provision was made for confinement in jail for some offenses. The first jails erected were merely small buildings of squared logs so arranged as to keep a criminal safely. The writer well remembers one of this kind in which a murderer, who was afterward hung, was confined some time. With the gradual growth of the State these were, in most cases, replaced with small brick buildings, often with but one secure room, having a small grated window, and no other provision for light or ventilation. Into this were put indiscriminately all who violated the statutes of the State and subjected themselves to imprisonment. Food was provided and brought by the jailer, and of course its quality and quantity depended much upon his will, and such attention was paid to the neatness and cleanliness of the cells as he thought proper, subject to an occasional inspection by the grand jury or county commissioners. Courts were but seldom held, and often prisoners remained several months awaiting trial. Many such jails are still found in the agricultural counties where there are no large towns and but little crime exists, and they are much of the time without a tenant. But the State has grown rapidly and now num-

bers about 1,800,000 inhabitants; railroads and turnpikes have been constructed in almost every part of it; vast bodies of coal and other minerals have been found, which have already given it, in many places, the characteristics of a manufacturing and mining community; large towns and cities have grown up, and as a natural consequence crime has increased. In some of the county-seats new jails have been built, in which much more attention has been paid to the laws of health and to the physical comfort of the prisoners, and yet too many of these have been built with iron cells and grated doors, affording little obstruction to free conversation and communication among the prisoners; a mistaken idea of kindness has caused most jailers during the day to allow the prisoners promiscuously to intermingle in the halls and corridors, thus opening the way for the hardened criminal to indoctrinate those less so, and for the younger to take lessons in crime from the older. We believe, however, that as public attention is called to the matter, more care will be taken in the construction and management of jails; and already, in some counties, fine buildings are being erected for prisons. The prisoners are not required to labor in any of these prisons, but are kept in total idleness. Books are sometimes furnished by the benevolent, and religious instruction is given occasionally by those who do it voluntarily.

A system of district prisons, in which several of the agricultural counties are united, for those convicted of minor offenses and for the untried, where the prisoners can be kept at labor and some attention given to their moral, educational, and religious improvement, is much needed, and it is hoped may gradually be introduced. There are ninety-two counties in the State; in many of them the jails are untenanted most of the year.

A state prison was first erected at Jeffersonville, opposite Louisville, Kentucky, on the Ohio River, about the year 1822. As was the case with many of the county jails, the cells were built of hewed logs about fifteen inches square, securely dovetailed together. The doors were of thick oak planks bound with iron bands. A hole in the center of the door three inches square was the only arrangement for ventilation. The first year there were seven convicts; three lessees had charge of them, who received from the State a bonus of \$300, in addition to the proceeds of the labor of the prisoners. In the course of a few years this temporary building was followed by a brick one, which was occupied until the present building was erected, in 1847 and 1848. It is of brick, and is surrounded by a brick wall $3\frac{1}{2}$ feet thick and 26 feet high, inclosing about four acres of ground, in which are situated the shops as well as cell-houses. The cells are $7\frac{1}{2}$ feet by 4 and $6\frac{1}{2}$ feet high, with no light or ventilation except through the grated door. There are now four hundred and six prisoners (about twenty of whom are women) confined in the prison. The building is considered wholly unsuitable, and the directors of the prison and the governor of the State unite in urging its abandonment. The system of leasing was abandoned in 1856, and the present plan adopted, by which the labor of the prisoners is let to contractors at a fixed price per day. Most of them are now employed in the manufacture of railroad-cars, under the direction of foremen and men furnished by the car company.

The management and government of the prison is in the hands of a board of three directors, elected by the legislature. These directors choose a warden, chaplain, physician, and moral instructor. The warden has the appointment of a deputy, clerk, and such number of assistant keepers as the directors may deem necessary. The discipline at present is kind, and the officers efficient and good men. Provision is made

by law for the moral instructor to teach such convicts as the warden may think proper "the art of reading, writing, arithmetic, and geography." It is the duty of the moral instructor to "superintend the mental and moral improvement of the convicts, instruct them once every Sabbath, visit them when sick, have charge of the library, and superintend the distribution and use of the books, and adopt such other means for the reformation of the convicts as himself, the warden, and directors may deem expedient."

The increase of prisoners, together with the fact that the Jeffersonville prison is located at the extreme southern part of the State, led the legislature, in 1859, to pass a law for the erection of another prison, at Michigan City, on Lake Michigan, in the north part of the State. This has been completed and in operation several years, and now contains three hundred and forty-one prisoners. The laws and regulations for the government of the Jeffersonville prison are in force for that at Michigan City, and the same methods of labor, discipline, &c., are used. The building is a good one, cells well ventilated and lighted, and sufficient provision is made for the health and comfort of the prisoners.

The whole number of convicts in both the state prisons at present is seven hundred and twenty-seven men and twenty women. These receive by law \$15 when discharged, "and every article of value which they may have had in their possession when received." No other provision is made by law for discharged convicts, nor are there any associations in existence for the purpose. A bill is now before the Indiana legislature providing for a State board of prison commissioners, which shall have charge of the prisons of the State, with a view of bringing about a classification of prisoners and other useful improvements in the prison system.

The constitution of Indiana (adopted 1851) contains a clause that "the general assembly shall provide houses of refuge for correction and reformation of juvenile offenders." This was not practically carried into effect until 1867, when the legislature passed a law for that purpose, in accordance with which a house of refuge for boys was built at Plainfield, fourteen miles west of Indianapolis. It is upon the family system and has two hundred boys, in four separate family buildings, who are employed at work on the farm of two hundred and twenty acres; also in cane-seating chairs, shoe-making, tailoring, and domestic work. Since the opening of the institution about one hundred and sixty boys have passed through it and been discharged, most of whom are filling useful places in the community, a few only having fallen back into crime. The results on the whole have been highly satisfactory. There is a constant pressure for the admission of boys, and it is hoped that the present session of the legislature will make an appropriation for its enlargement.

A law was passed by the general assembly in 1869, establishing "The Indiana Reformatory Institute for Women and Girls," intended as a state prison for women and a girls' reformatory, in separate departments, under the same management, and a building has been erected, but not yet completed. It is much needed, in order to furnish a place for the few women prisoners now confined at Jeffersonville, as well as for a girls' reformatory.

In four or five of the cities of the State there are "homes for friendless women," supported by private contributions.

5. IOWA.

By Martin Heisey, late warden of the State penitentiary.

The institutions established in the State of Iowa for the punishment and prevention of crime are a state prison, a state reform school, and county jails in most of the ninety-eight counties of the State.

The state prison is at Fort Madison, in the southeastern part of the State; but another penal institution is in process of construction at Anamosa, near the center. The discipline aims to be at once deterrent and reformatory. Experience has shown that in the great majority of cases kindness and appeals to reason and manhood are efficacious with the most hardened characters. Special attention is given to cleanliness, and the dietary, though plain, is abundant and wholesome. The result is that we have very little sickness, and a death very seldom occurs. The whole number of prisoners last year was two hundred and eighty, of whom only one was a woman.

The prison has a chaplain, who gives his whole time to the moral and religious instruction and reformation of the convicts, preaching to them on the Sabbath, and laboring with them personally during the week. Every convict is provided with a Bible.

There is a flourishing Sunday-school in connection with the penitentiary. The average attendance is about two hundred and thirty. The school is conducted as Sunday-schools generally are. The citizens in the vicinity show their interest by taking part in the instruction. The good effects of the Sunday-school are seen in these noteworthy facts. First, there is less punishment required to preserve the discipline of the prison by more than one-half than before the establishment of the school. Secondly, the men do more work and do it better. Thirdly, alacrity and cheerfulness have taken the place of moroseness and sullen discontent.

The common jail system needs great reforms. Numbers of the jails are deficient in nearly all the requisites for prisons of that sort.

A state reform school was established in 1868, at Salem, the results of which have been highly gratifying.

6. KANSAS.

By Henry Hopkins, warden of the State penitentiary.

It would be difficult to say what is doing, or has been done, throughout the State, by individuals, outside of the officials immediately connected with the prison. We have to contend with a very general feeling of indifference as to present or future welfare of those committed to or discharged from prison. This is apt to be greater in new than is usually the case in older States. Crime is more prevalent in States newly organized, into which the criminal class has been driven by advanced civilization from other localities.

The principal institution organized for the treatment of criminals is the State penitentiary, at Leavenworth, now only about one-third completed. It is to consist of a main building, composed of two wings of 250 by 60 feet each, with a cell block of four tiers, numbering six hundred and eighty-eight cells in all. Between these wings will be a building 80 feet square and four stories high. A wall 6 feet thick and 24 feet

high incloses a space of ten acres. This inclosure will contain all the necessary out-buildings and workshops.

The discipline is intended to be reformatory in its administration, the prison being conducted on the congregate silent system. Chapel services are held every Sabbath, and all prisoners are required to attend. After the general services a prisoners' meeting is held, at which any who wish may remain and take a part in the exercises. A school is also organized for secular instruction, in which reading, writing, and arithmetic are taught to those who are deficient. The prisoners participate in their earnings to the amount of about \$12 each year, conditioned, however, on obedience to the prison rules. The prison is supplied with a well-selected library. The prisoners are allowed to apply their earnings for the purchase of books and literary papers, or for the benefit of their families.

Commutation, that is, abbreviation of sentence and a restoration to the rights of citizenship, are allowed to all who by good conduct merit these rewards. Permission is given to write letters once each month, and to receive letters once each week from relatives and friends.

The object is to establish such trades as can be followed in this State after discharge, and to every prisoner, whenever possible, is taught either an entire trade or so much of a trade as will enable him to gain a livelihood when discharged. For the general good of the prisoners sedentary trades are excluded as much as possible.

Punishment is avoided in every case where the same result can be obtained by other means. Violations of prison rules are always noticed in some manner, and the punishment of offenders is only administered by the warden or his deputy. Close attention is paid to the physical requirements of the prisoners, and a ready and diligent performance of labor is demanded. The intention is to make the prison pay all expenses, and, if possible, to produce a revenue, because we believe that so the prisoners may be most certainly reformed.

Employment is provided for as many as desire it, on discharge, whenever it can be found. This duty devolves especially on the chaplain, who resides at the prison and devotes his entire time to the duties of his office.

The contract system is not in use here, the industries being carried on by the State, with the exception of twelve men. This I consider far preferable to contracting, as it is seldom that a contractor takes any interest in the reformation of the prisoners, his great aim being to make as much money out of them as possible. The idea of the discipline in this prison is to make better men of those sent to it, and at the same time to so administer it as to deter others from making it necessary to send them here. Make it corrective, and you thereby make it repulsive. Correction is naturally repugnant to the human heart.

We have, as yet, no preventive institution in Kansas under that name, but the Home for Friendless Women, at Leavenworth, subserves that end very effectively, as far as it goes, as the following extract from its first report shows:

Much good has been accomplished by this agency, as it has been the means of saving many from a criminal life.

Two years since the Kansas legislature gave \$10,000 with which to build a "Home." The city of Leavenworth gave lots worth \$2,000, on which to build. The edifice is now completed. It is 43 by 36 feet, composed of four stories, including basement; is of brick, and of tasteful design. It was formally opened October 3, 1871, and has met the needs of the association. With barn, fences, substantial stone walk, and grounds filled with fruit trees and shrubbery, it is an ornament to the city, and stands a perpetual encomium of the liberality and charity of the State which built and the towns

which furnished it. There is no endowment, and no one connected with the institution receives a dollar's pay for time or labor, except its matron. Even our physicians' onerous services are gratuitous. It has extended aid to over two hundred and fifty women. During the last year one hundred and ten have been admitted, and twenty children have been born under its roof. Of these inmates comparatively few have belonged to Leavenworth. The poor and friendless, whom we feed, shelter, and befriend, are not ours alone. They come from other towns and neighborhoods. They comprise respectable women who reach Leavenworth out of money, and needing temporary help, a few meals and lodging, until they can hear from friends. Or they are forsaken wives, who, perhaps, find themselves on the eve of maternity without friends or shelter. Often they are young girls from the country seeking employment, and while doing so come to us for refuge, and if we fail to give it they are easily found of "her whose house inclineth unto death and her paths to the dead." We also have many cases of young girls from other localities, who leave their homes hoping to hide their shame among the crowds of a strange city. Caring for these through the hour of woman's greatest trial—and, when they wish it, adopting their children—we can often save those unpitied mothers from further degradation, and return them to their homes and better lives.

And last, but not least, we wish to keep open a refuge for the only class against which a cold world seems savagely to bar the door of reform—*fallen but repentant women*.

There are two orphan asylums (one Protestant and one Catholic) organized in the State, which are doing much good for the outcast youthful population. Good homes are secured for all when they arrive at suitable ages, and they are watched over after discharge from the institutions.

It is in contemplation to organize a house of refuge at an early day. All these indications show that the *people* are becoming aroused to the necessity of providing for existing wrongs.

Our system of free schools is not excelled by that of any State in the Union, and its fund is inexhaustible. Two State normal schools are now organized, and every school district in the State has its substantial school-building, and is supplied with competent teachers.

Compulsory education is gaining favor throughout the State. This, if properly applied, will act as a great preventive of crime. Would it not be well to re-establish the old Jewish law, and require every boy to learn a trade, as it is seldom, indeed, that a good mechanic is sent to prison from any cause?

7. MAINE.

By Rev. J. K. Mason, former chaplain of the state prison.

The State of Maine was formerly a "district of Massachusetts," and, singular as it may seem, presented the phenomenon of a district several times larger than the State to which it belonged. In 1820 it became itself a State.

In regard to penal and reformatory institutions, Maine is behind several of her sister States. This results in part from having given her attention more to the causes than the cure of crime; to what makes criminals of men than to what will make men of criminals. The grand question has been how to preserve her population industrious, sober, and moral, and thus safe and prosperous. Thus reformatory systems and discipline have been somewhat overlooked, until of late. Maine is clear in her conviction that something more is to be done for her fallen ones, but is nevertheless quite as clear that she must look first at the causes of their fall. The so-called Maine law in regard to the sale of intoxicating liquors is one of the results of this conviction, and not a mere "fanatical

whim," as some have thought. If it be true, as facts demonstrate, that at least three-fourths of all the convicts in the State penitentiary are there through the influence of intoxicating liquors, it has seemed that *wise* men, and certainly *good* men, could not be at a loss where to apply some State force. The wonder is that any are blind enough, either through prejudice or ignorance, to suffer an evil that is so monstrous to continue its havoc and necessitate these penal institutions everywhere as exponents of its accursed entail.

The State penitentiary is located at Thomaston, and is in a condition of great industrial and financial prosperity. In this respect, the past year has exceeded every other in its history. I think I hazard nothing in saying that it is unexcelled. It is conducted on the congregate plan, and every man who is physically able must work at some trade, which he is stimulated in various ways to become master of, so that he may have resources within himself that will in the future diminish his temptation to crime. His educational and religious wants are so cared for, under the direction of a chaplain, that he has no excuse for further ignorance or wickedness. The amount of instruction, however, in both, might be largely increased by means of additional facilities. The sanitary arrangements are good; food plenty and wholesome; an occasional holiday granted, when a sumptuous dinner is given and opportunity afforded for social intercourse for an hour or two, under the eye of the officers and a few friends. Personal cleanliness is insisted on as a virtue indispensable to both physical and moral health. It is the aim of the government in all its rules and practical applications to inspire courage in the convicts—to lift them into as high a measure of manhood as possible with their present surroundings—and to fit those whose sentences are not perpetual to go forth to society and the world again with habits of patient industry, a remunerative trade, and some educational acquirements; controlled by principles or purposes of integrity and sobriety, and stimulated to a faith and hope that will help them through a great many unavoidable difficulties and discouragements.

The Hon. W. W. Rice, who has been warden for the past nine years, not believing in the policy of the contract system of labor, has held the specific control of the industrial and business matters in his own hands, giving personal attention to the various details. He believes that *that* has been one of the grand secrets of its industrial and financial success. Under a less energetic and able financier, the balance-sheet might show footings not so favorable.

The warden is appointed by the governor and council for the term of four years, and has control and is made responsible for all the subordinate officers, concurrently with the inspectors. One of the inspectors, who are also appointed by the executive of the State, is required to visit the prison at least once each month, and the entire board once in three months, to make careful investigation in regard to all the interests of the prison. There is a commutation law by which the executive may deduct a certain portion from the sentence of every convict for industry and obedience. This operates as a constant incentive to all who are not utterly and hopelessly incorrigible.

The present number of convicts is one hundred and sixty-four, one-fifth of whom are under twenty-one years of age. About two-thirds under twenty-seven.

Our county jails are by no means what they should be, but I forbear a description of them as they are, since they are now undergoing careful study, and the probability is that they will be speedily reconstructed in such manner, as to have connected therewith facilities for vari-

ous industries, and for classifying their inmates; and some of them appointed as places of detention, discipline, industry, and other appliances of penal and reformatory treatment for a class of criminals whose antecedents hardly warrant the practice hitherto followed of degrading them as the worst of criminals by commitment to the state prison.

Our State Reform School for Boys is located at Cape Elizabeth, a suburb of the city of Portland, and is at present in charge of the Rev. E. W. Hutchinson as superintendent. It has existed for nineteen years and been attended with somewhat varied success. This school, for certain reasons, does not accomplish all that was hoped from it. One of these is, doubtless, to be found in the statutory provision that, under certain specified circumstances, the several towns or cities patronizing it shall contribute \$1 per week for each inmate they furnish. The result is that they send as few as possible, and the rural towns ignore it almost wholly. Of the fifty-nine commitments the past year nearly one-half were from the single city of Portland. From three other principal cities not a single commitment was recorded. If that provision of the statute were repealed and another substituted requiring the parents to pay such a part of the expense as the town or city assessors might consider them able to do, a demand of justice would be met, a difficulty remedied, and, perhaps, a stimulus created that would operate favorably in regard to home discipline.

This institution is conducted after the congregate system; is under the general direction of a board of trustees, who appoint the superintendent and assistant superintendent, matron, physician, and chaplain, and all the subordinate officers, and assign their position and duties. The whole is under the general supervision of the governor and council. There is a large farm connected therewith, the cultivation of which is carried on by the labor of the boys with a moderate degree of success. The shoe business affords employment for a score or two of the boys, and chair-bottoming for as many more; and a large number of the youngest are employed at knitting, sewing, &c., for the older ones. The various other kinds of work about the institution are done by the inmates, under the direction of departmental overseers. The educational department is in charge of several teachers, selected with reference to the different grades, according to which the inmates are classified. Most of the boys make good proficiency.

The Sabbath-school work is carried on by the voluntary efforts of Christian men and women from the city. Based on the influence of this and on the acquiring of habits of industry, of which, on entering, nearly all are destitute, the friends have learned to recognize their main reliance for reform. At the close of 1871 the school numbered one hundred and thirty-four, twenty-six less than the preceding year. The whole number committed in eighteen years of its history is one thousand two hundred and eighty-one, of ages varying from seven to nineteen years.

Of the whole number, more than one-third had intemperate parents; another third had relatives in prison; two-thirds were habitually idle. More than two-fifths were truants; nearly one-half were Sabbath-breakers; more than three-fourths were untruthful, and more than two-thirds were profane: a sad commentary on the places many children are allowed to call "home," and still worse on the character of their parents.

The institution is sustained by the products of its own labor as far as that will go; the residue, about one-half or two-thirds of the expenses,

being provided for by appropriations direct from the State treasury. All its business transactions are conducted on the cash basis.

An industrial school for girls is partially inaugurated, and it is expected that the current year will see it in operation.

Maine believes that penalty should be administered as far as possible in the interest of reform.

8. MARYLAND.

By G. S. Griffith, president of the Maryland Prisoners' Aid Association.

The prominent penal reformatory and preventive institutions of Maryland are situated in the city of Baltimore and its immediate vicinity.

The prisons, properly so called, are the State penitentiary, the Baltimore jail, and twenty-one other jails in the several counties additional to that of Baltimore.

The State penitentiary is in Baltimore. The whole number in the prison at the close of 1872 was 598; of whom 541 were males, and 57 females; of the males, 371 were colored; of the females, 52. There were received into the prison in 1869, 317 prisoners; in 1870, 280; in 1871, 262; in 1872, 188. This statement would indicate a gradual decrease of crime in Maryland within the last four years.

While the discipline is positively deterrent, it earnestly aims to be reformatory. The agencies employed are *moral suasion, positive discipline, labor, and rewards*. Rewards, however, are more relied upon than punishments, and with the best results.

The general condition of criminals in point of education, on their commitment, is lamentable. Unhappily no systematic effort is made for their mental improvement while in prison. The penitentiary, however, contains a very good library for the use of the convicts.

The labor of the prisoners is let to contractors. It is believed that this institution will be hereafter self-sustaining, the opportunities and organization of labor having been improved by the enlargement of the workshops.

There are no religious agencies officially employed, but the Prisoners' Aid Association, to be hereafter spoken of, takes charge of this work. It has established two flourishing Sunday-schools in the prison, which are taught by ladies and gentlemen who volunteer their services. These religious exercises are much prized by the prisoners, and excite the lively interest of all who witness them. Sacred music is taught to the prisoners as an element of reform. On Sunday afternoons the male and female convicts are assembled in separate chapels for divine service. The officiating ministers are selected from different denominations. It is optional with the prisoners to attend or not. Three hundred and forty-three availed themselves of the privilege last year.

The Baltimore City Jail is a substantial stone building, of striking architectural proportions. In its construction and arrangements it may be regarded as a model institution. Most of the other county jails are defective in all the attributes of a good prison. Under the auspices of the aid association, religious exercises are regularly conducted on Sunday afternoons in the chapel of the Baltimore jail.

The reformatory and preventive institutions of Maryland are the Baltimore House of Refuge, the Maryland Inebriate Asylum, the Home of the Good Shepherd for Women, the Maryland Industrial School for

Girls, the Home for Fallen Women, the Saint Mary's Industrial School for Boys, the Manual Labor School, the Children's Aid Society for Boys and Girls, the Home of the Friendless for Children, and the House of Reformation and Instruction for Colored Children.

The House of Refuge is situated two miles from Baltimore, in a high and healthy location. The building is constructed with a view to develop the physical as well as the moral and mental growth of the inmates. This is the most important reformatory in Maryland for juvenile delinquents. It is designed to receive the youth of our State who become too insubordinate to be governed by their parents or guardians, and for those who are sentenced by the criminal courts and magistrates for committing public offenses. They are sent to the care of this institution until they become of age, unless otherwise provided for by the board of managers in consideration of great moral improvement, which often occurs under the excellent administration of the superintendent, Mr. William R. Lincoln.

Religious instruction is given without any denominational bias. The institution contains a commodious chapel. Divine service is conducted every Sunday afternoon by clergymen invited from various denominations. The congregational singing is led by Mrs. Lincoln, the worthy wife of the superintendent, who presides on all occasions with perfect command of the organ.

The usual exercises of a Sunday-school are regularly observed; the helpers in this good work consist of a faithful corps of teachers, who go out from the city every Sunday morning.

Music is a particular element of education of the boys. They have organized a brass band, which is the source of much pleasure on public days and festive occasions. They are frequently invited to the city, to play at fairs, and other entertainments held for benevolent purposes. The other branches taught are those of a primary common school. The larger boys receive instruction equal in grade to that of the grammar-schools, including the elements of natural philosophy, physiology, algebra, &c. The refuge is at once a benevolent, reformatory, and educational institution. Since it was opened in 1855, 2,159 minors have passed under its control, of whom 1,942 were boys, and 217 were girls. At the present date there remain under care 331, of whom 315 are boys and 16 girls.

Labor is found to be a most desirable adjunct in the effort of reform. The workshop, next to the Sunday-school and secular instruction, is the best corrective of evil habits. Here the boys are employed in the harness shop, shoe shop, tailor's shop, broom and basket shop, in caning chair-seats, &c., and in farming and gardening, besides assisting in the work of the household. The products of the farm and garden last year amounted to \$2,248.28. The institution is in part self-supporting, yielding a profit from the mechanical labor of the inmates.

The Saint Mary's Industrial School for the city of Baltimore is a Roman Catholic institution. Its object is to receive, teach, and train to virtue and industry orphans and other destitute boys. It has an imposing building and a farm of one hundred acres. The boys are committed to this school, not for crime, but on account of destitution and to *prevent* crime. It has received in all two hundred and sixty-nine boys, of whom fifty-one have been apprenticed to farmers.

The Baltimore Manual Labor School, for indigent boys, was established in 1842, and has had an average of forty-five boys. It is neither penal nor reformatory, but preventive. It receives only orphans or half-orphans. It has a farm of one hundred and forty acres. The

boys, on leaving the institution, are apprenticed to some mechanic or farmer.

The Boys' Home is not a reformatory, such as the house of refuge, nor is it a house of correction, where coercion or force can be employed to compel obedience. It is a large household, wherein obedience is recognized as a duty, and love is the incentive to its exercise. Like any well-regulated family circle, it has its daily separations and reunions. After breakfast each member goes out to his appointed labor. The directors find the system of encouraging volunteer labor to work admirably. The boys are assisted to find work, and get fair wages. Most of them are learning mechanical trades. Those who have employment are charged the small board of \$1.75 per week. The balance of their earnings is put into a savings-box until the end of the year, and then returned to them. This arrangement generates feelings of independence and self-respect. Under the genial influences of the Home, they are taught habits of economy, cleanliness, virtue, industry, obedience, and self-reliance. It prevents vagrancy, pauperism, crime, and juvenile delinquency. This is a great saving to taxpayers, and sound political economy.

The Maryland Industrial School for Girls is designed to rescue girls between twelve and eighteen years of age, who have lost their virtue or are in danger of losing it, from vagrancy and exposure to evil influences. Since the opening, in 1868, seventy-two girls have been received. The discipline of the school is that of a Christian family. Its law is kindness. There are no walls or bolts. No corporeal punishment is permitted. Deprivation of privileges and meals, with detention of the refractory in her room until penitent, is sufficient. The ordinary branches of a common-school education are taught, with singing and Bible lessons. Instruction is also given in all branches of household labor, and in canning fruits and vegetables. The improvement of the girls in all respects has been very marked and gratifying while in the institution. Thirty-four have been restored to their friends, twenty-three have been provided with situations, two have died; the rest are either now in the school, or have been discharged for disease or other causes. Religious instruction has been regularly given.

The Children's Aid Society is a recognized temporary asylum for all truant and stray children picked up in the streets by the police, and for children whose parents have been committed to the jail or almshouse for disorderly conduct or vagrancy. In many cases they receive food and shelter until they are found by their parents, or reclaimed by others after they are released from confinement. Since the institution was opened, in 1860, 1,092 children have received its protection. At present 330 are in good homes provided for them either in Maryland or in the neighboring States of Pennsylvania and Virginia. Their foster-parents, or those who take them in charge, are required by the board of managers to make monthly reports concerning their welfare.

The Home for the Friendless is a preventive institution under a board of lady managers. It receives small boys and girls, the neglected, deserted, unhealthy, maimed, crippled, and also the incurably afflicted. The total number of inmates received since it was organized is 1,042. Of these there remain at present date 130, many of whom are under eight years of age.

The House of Reformation and Instruction for Colored Children was incorporated by the general assembly of Maryland at the January session, 1870. Maryland has a large colored population, especially since the emancipation of slaves. This population, which has heretofore been

deprived of the benefits of education, is now thrown upon us in a deplorable state of ignorance. Ignorance, idle habits, and crime generally go hand-in-hand together, and become an element of danger to the community. The board of visitors of the Baltimore city jail report the following commitments of colored persons during the past year: For the violation of the peace and for drunkenness, 1,890; for larceny, 375; for vagrancy, 70; in all, 2,335, many of whom were children between the age of eight and ten years.

A farm, containing 700 acres, in Prince George's County, has been purchased for this institution. Appropriations have been made by the State legislature of \$10,000 for two succeeding years, making a total of \$20,000. Twenty thousand dollars additional have been contributed for this object by Enoch Pratt, esq., and ten thousand dollars more by subscription.

Such is a brief and imperfect sketch of the preventive and reformatory institutions of Maryland.

What is the chief cause of crime? Neglect of the early right training of children. What is the chief preventive of crime? Increase the forces a hundredfold to save the children. The unrestrained boys and girls of our community are the roots of that cancer which grows into public injury. It is a sad, stern truth that some of those who are now boys and girls are to be the paupers and criminals of the future. No one doubts that many noble and useful citizens come from the ranks of the poor. Yet it is no less true that paupers and criminals spring almost entirely from the untrained outcasts of society, such as neglected orphans, children of drunkards, the illegitimate children of prisoners and paupers, and the children of thieves.

The situation of the reformatory and preventive institutions of Maryland is a subject worthy of note. They are located in the most healthy sections of the city or county of Baltimore, on broad streets, wide avenues, or eligible farms, the sanitary advantages having been always considered in selecting a site. The buildings are erected on high grounds, affording spacious yards or areas for exercise during the hours of recreation. They are constructed with large windows, wide passages, and broad stairways, with a view to obtain the unobstructed rays of light from the rising to the setting of the sun, and a free and full circulation of pure air. It is a fact which marks the history of these various institutions, that the inmates are exempt in an extraordinary manner from epidemics or even sporadic diseases. Their list of mortality records fewer deaths than occur in common households among the same number of children and youth.

Experience teaches that the essential elements of health will promote the moral as well as the physical growth of human nature. The genial influences of air and sunshine will penetrate the heart and generate kindly feelings, stimulate bright thoughts, and excite the hands to useful works.

The work of aiding discharged prisoners is well organized in this State. The Maryland Prisoners' Aid Society was established early in 1869, and has been ever since working with zeal, efficiency, and success. The sphere of action of this society begins in the State penitentiary, and extends to all the jails and almshouses throughout the State of Maryland. The officers and wardens seem willing to co-operate in any measures the association may suggest to improve the condition of the inmates under their charge. The principles on which it works, and the work itself, have secured the hearty approval of both the criminal courts and the prison authorities, as the following testimonies abundantly prove.

Judge Gilmor, of the criminal court of Baltimore, says: "I take great interest in the successful operations of this society, which I regard as one of the best and most important of our public charities. It has already accomplished much good, and if the welfare of that large class whose condition it is its aim to relieve, is not deriving all the benefit it should, it is only because enough of our charitable citizens have not as yet come forward to unite in and contribute toward the objects proposed by the association."

In their last annual report the board of visitors of the Baltimore city jail remark: "The Prisoners' Aid Association, of which Rev. Penfield Doll is the agent, and whose benevolent work among the fallen and guilty it has more than once been our pleasure to acknowledge, is continuously at work, and making its influence for good widely felt."

9. MASSACHUSETTS.

By F. B. Sanborn, member of the Massachusetts Board of State Charities.

Massachusetts, which by the census of 1870 had a population of 1,457,351, now contains more than a million and a half inhabitants, of whom only about 14,000 are colored persons, while nearly 400,000 are of foreign birth, and more than 630,000 of foreign parentage. It has been estimated that from 25,000 to 30,000 of these inhabitants belong to what may be called the criminal class, including drunkards and vagrants, who, under Massachusetts laws, are punishable with imprisonment. The actual number of different persons imprisoned in a single year (exclusive of pupils in reformatories) is now probably about 15,000, and steadily increasing. The number of persons convicted of greater and smaller offenses, in 1872, was about 8,000, probably; but of these only 160 were sent to the state prison at Charlestown. The average number in all the prisons, commonly so-called, including persons waiting trial, or held as witnesses, was 3,218, of whom 543 were in the Charlestown prison, and 298 in the State work-house at Bridgewater, making 841 under direct State control; something less than 2,000 were in houses of correction and other convict prisons under city and county control, and 429 were in the county jails. The whole number in prison in Massachusetts on the 1st of January, 1873, was about 3,280; namely, 576 in the state prison at Charlestown, 228 at the Bridgewater State work-house, 1,440 in thirteen county houses of correction, 582 in the Boston work-house or house of industry, and 454 in seventeen county jails. Add to these the number temporarily imprisoned that day in guard-houses, police-stations, &c., and the aggregate would exceed 3,350. The figures of the census of 1870, in regard to crime in Massachusetts, are very incorrect.

The number in the State, city, and county prisons, exclusive of the guard-houses and station-houses, on the 1st of October, 1872, was reported as 3,461, of whom 562 were at Charlestown, 267 at Bridgewater, 657 in the Boston house of industry, 440 in the South Boston house of correction, 250 in the Boston jail, 266 in the Cambridge house of correction, 152 in the New Bedford house of correction, and 112 in that at Ipswich. The whole number in the jails was then 552; in the houses of correction 1,423; and the aggregate, 3,461, was the largest ever reported in Massachusetts.

In the three large public reformatories of Massachusetts, the State Reform Schools at Westborough and Lancaster, and the Boston House

of Reformation, controlled by the city, the whole number of inmates, January 1, 1873, was 725, namely: 297 boys at Westborough, 128 girls at Lancaster, and 300 (boys 260, girls 40) at Boston. The average number for the year 1872 was something more than this, namely: 267 at Westborough, 122 at Lancaster, 75 at the School-Ship, (now discontinued,) and 280 at Boston; in all about 740. The average number confined in prisons and reformatories in Massachusetts may therefore be stated in round numbers at about 4,000, though there are a few small city reform-schools which would bring the aggregate above that amount. In the preventive schools, such as the State Primary School at Monson, with an average last year of 361, the House of the Angel Guardian, (a Roman Catholic school,) in Boston, with an average of 175 pupils, the Boston Farm School, with 100 pupils, and a few other establishments, there were between 700 and 1,000 inmates. Therefore the constant population of the penal, reformatory, and preventive establishments in Massachusetts, public and private, may be taken as not exceeding 5,000, or one in every 300 of the inhabitants.

The prisons.

I. The Charlestown state prison is one of the oldest in the country, having been begun in 1800, and opened in 1804. It has been conducted on the Auburn, or silent congregate system, since 1827, when it was rebuilt, but has since been much enlarged, containing now about 600 cells. A plan has been submitted to the legislature of 1873 for building a new state prison at a greater distance from Boston, and it is probable that the Charlestown site will be abandoned within the next five years.

No women have been sentenced to Charlestown for more than fifty years, or since 1820, and no man is sentenced there for a less period than one year. Of 562 convicts there, October 1, 1872, 62 were sentenced for life, 11 for twenty years and upwards, 50 for ten years, 31 for periods between ten and twenty years, 106 for five years, 84 for periods between five and ten years, 104 for three years, 47 for periods between three and five years, and 65 for less than three years. The number of colored prisoners was 40; 97 were born in Ireland, 30 in Great Britain, 21 in the British-American provinces, and 382 in the United States; of these, however, nearly one-half were probably of foreign parentage. Of the 562, 77 were recommitments, and of 160 convicts received in 1872, 24 were recommitments. The whole number in prison during the year was 703, of whom 19 died, 16 were pardoned, 3 sent to lunatic hospitals, and 1 escaped. The average number in prison being 543, an average of 91 were reported as unfit for contract labor. The other 452 convicts earned by contract labor the sum of \$126,010, or about \$10,000 more than it cost to support the prison. The average price per day for contract labor was 99 cents, which is believed to be 41 cents less than its real value to the contractors. The expenses of the Charlestown prison for the year 1872 were about \$116,000, of which something less than \$800 was paid for the education of prisoners, about \$37,000 for provisions, and \$42,362 for the salaries of officers. A school numbering from 100 to 150 convicts is held about two evenings in the week, and there is a Sunday-school of something more than 100 convicts. The number of volumes in the prison library is 2,236, of which about 100 are daily lent to the convicts.

II. The Bridgewater state workhouse is a new institution, being created in 1866, and opened the same year in the old buildings of the state

almshouse at Bridgewater, near Plymouth. Its inmates are mostly drunkards, vagrants, prostitutes, &c., who apply to the State or to the municipalities for support, and are sentenced to support themselves by labor. A great majority of them are women, and it is proposed by Governor Washburn, in his last message, now before the legislature, to make this workhouse a prison for women exclusively. It is, in fact, a prison of the same grade as the county houses of correction and the Boston House of Industry. The whole number of convicts there in 1872 was 596; the average number was 298, and the cost of their support was \$34,662. Their earnings from labor were \$1,654, and the net cost of their support was about \$33,000.

III. The Boston House of Industry was established about forty years ago, and is the city prison of Boston for vagrants, drunkards, prostitutes, &c., containing more convicts than any other prison in the State. A majority of these are women, as in the state workhouse. The average number of both sexes in 1872 was 576, the cost of supporting them \$76,853, and the earnings from their labor \$13,987, showing a net cost of \$62,866. This prison, like the South Boston House of Correction, is controlled by the city authorities.

IV. The county prisons are numerous and various, there being fourteen counties in Massachusetts, and each being entitled, should it need them, to maintain one or more jails, and as many houses of correction. The distinction between these two classes of prisons in law is simply that in our jails labor is not required, while it is compulsory in houses of correction. But in practice (although a few persons are still sentenced to jails) convicts alone go to houses of correction, and persons awaiting trial, or the execution of sentence, remain in jails. Where the sentence is a fine, as in more than half the cases tried in Massachusetts it probably is, the person fined, if unable or unwilling to pay it, generally goes to jail for a short time. There are, in fact, eighteen jails and sixteen houses of correction in the fourteen counties, which were used as prisons in 1872; but of these only four jails (at Boston, Salem, Lowell, and Newburyport) and two houses of correction (at Ipswich and South Boston) were separate establishments. The other fourteen county prisons contained each a jail and house of correction under the same roof and management, so that there are but twenty distinct county prisons, which are located two at Boston, and one each at Barnstable, Pittsfield, New Bedford, Edgartown, Ipswich, Lawrence, Newburyport, Salem, Greenfield, Springfield, Northampton, Cambridge, Lowell, Nantucket, Dedham, Plymouth, Fitchburgh, and Worcester. At Taunton a new jail is building, to replace an old one. The number of prisoners in these twenty establishments ranges from one to four hundred and fifty in each, and almost every variety of prison architecture and prison management, except the best, may be found in them. The largest jail is in Boston, situated on the Charles River, between the two bridges leading to Cambridge, and containing an average of more than two hundred prisoners, whose support in 1872 cost not far from \$25,000, or nearly \$2.50 a week *per capita*. The largest house of correction is also in Boston, with an average number of convicts, in 1872, of 420, who earned \$7,733 above their expenses. The whole number committed to all the jails was above 6,000, to the houses of correction above 5,000, but many were identical in the two classes of prisons. The average number in all the jails was 429; in all the houses of correction, 1,372; in all the county prisons, 1,801. The cost of all these, above their earnings, was \$154,711. There was paid for officers' salaries in these county prisons, \$82,000; for provisions, \$103,000; for

purposes of education, mostly chaplains' salaries, \$2,709; for clothing and bedding, \$21,500; for fuel and lights, \$40,000. The average net cost for each prisoner was within a fraction of \$86 a year, or nearly \$1.70 a week.

The gross expenditure was \$283,847, and the earnings from labor \$129,136. The difference between these two aggregates represents the net cost, as above given. A little more than one in ten of the jail prisoners are women, and nearly one-third of these are in the houses of correction. More than one-half of both sexes were foreign-born, and probably four-fifths were of foreign parentage.

An attempt is now making, in the legislature of 1873, to change materially the management of the county prisons. To show the need of some better system than exists at present, a passage may be quoted from a paper submitted from the United States to the London Prison Congress of last July:

There is no better illustration, probably, of the whimsical lack of all proper centralization of prison authority in the United States, than the present condition of the laws and their administration, as regards prison inspection and management, in Massachusetts—the State which is often considered, and certainly considers itself, as foremost in prison discipline, not only in America, but in the whole world. In some respects, no doubt, Massachusetts holds an advanced position, but whether this is true of her system of prison management may be judged from the facts now to be stated. Within her borders are three distinct classes of prisons—those of the State, of the fourteen counties, and of the cities and towns. There are two state prisons, viz, at Charlestown, near Boston, and at Bridgewater, not far from Plymouth, wholly distinct in their management, except that the board of State charities, which has the power of discharge at Bridgewater, has the general inspection of both, but with no authority to appoint officers or to establish rules in either. The governor and council of the State have also general powers of inspection, and can pardon convicts in the Charlestown prison, as well as appoint the chief officers of both state prisons. But, besides these two boards of inspection, there is also a board of inspectors for Charlestown, and another for Bridgewater, quite independent of each other; and these two boards, in concert with the warden or master of either prison, manage all the details of its affairs, and report both to the governor of the State and to the board of State charities. There is a prison commission also, which has no duties concerning the Charlestown prison, but which may visit and inspect the other; there is an "advisory board" of ladies, to assist the prison commission; and, finally, there is every year a prison committee of the State legislature, which visits and reports upon both state prisons, but has no power to do anything further. Thus there are seven distinct commissions to look after these two prisons, including in all no less than thirty-seven official persons, all more or less charged with the duty of inspection, but without any practical co-operation with, or subordination to, each other. Then there are fourteen counties in the State, each containing one jail, and several containing two or three each, which are under the control of the county sheriffs, chosen by the people, for terms of three years, and of a board of commissioners in each county chosen in the same way. But in the largest county (Suffolk) and the smallest (Nantucket) there are no county commissioners, the municipal governments of Boston and of Nantucket Town taking their place. These jails are also inspected by the board of charities (when it chooses) and by the prison commission, the advisory board, and the prison committee of the legislature; and may be inspected by the governor, who has power to remove the county sheriffs. There are nineteen of these jails, each controlled and inspected by six different boards, including in all about seventy-five official persons. Then there are fifteen other county prisons for convicts, called houses of correction, thirteen of which are managed by the county commissioners above mentioned; one by the "selectmen" of Nantucket Town; and one, the largest of all, by a Boston board, called the directors of public institutions of the city of Boston; which also has under its control another great Boston prison, known as the house of industry. In each county the commissioners appoint another board, called overseers of the house of correction, who are to inspect those prisons and have some control of their management; these number in all about forty, and the Boston board has twelve members, thus adding some fifty more official persons to the long list. All the houses of correction may be visited and inspected by the board of charities, the prison commission, the advisory board, and the prison committee, as well as each by its own overseers and commissioners, or directors, and by the governor and council, who have the pardoning power jointly with the overseers; so that there are eight distinct boards, comprising about 120 persons for these fifteen

prisons. The Boston house of industry, however, is exempt from all inspection save by its own directors and the prison committee of the legislature. Next come the city and town guard houses, or police stations, of which, perhaps, there are one hundred and twenty in the whole State, under the charge of the municipal governments, and rarely inspected by anybody else. The managers of these small prisons probably number about 300, and are annually elected by the people. Finally, there are the city and town work-houses, large and small, numbering, perhaps, a dozen in all, and managed by a few of the same 300 municipal officers. In all, we may count up for the Massachusetts prisons not less than 350 different official persons concerned in their management and inspection; the number of prisoners in them all never exceeding 3,500 at any one time.

From this we might infer that the Massachusetts prisons were thoroughly inspected, however perplexing might be the system under which it was done. But, in fact, there is no municipal inspector who has been in all the municipal prisons; no county inspector who has been in all the county prisons; few State inspectors who have been in all the county prisons or any of the municipal ones; and no one official person in the State who has ever visited half of the prisons it contains. Consequently, there is no proper knowledge anywhere of the relation of one part of the prison system to the rest, and no proper system at all, but only a confusion of laws, rules, boards, and details. There are wheels in plenty, and wheels within wheels, more than the sacred prophet saw in his vision; but there is no "spirit within the wheels" by which they are regulated and made to move harmoniously. Probably no other State enjoys so complicated and various a prison system as Massachusetts, in which are as many devices and contrivances as in the cabinet where the Abbé Siéyes, in Burke's famous satire, manufactured constitutions for France. Unfortunately these devices, however ingenious, result in neutralizing responsibility, deadening the public vigilance, and opening the door to culpable neglect and to petty corruption. The instruction, the reformation, the discipline, and even the life of poor prisoners may be sacrificed in the medley and delay of so much legal machinery; for each of these important things, like Johnson's hero, is

Condemned, a needy suppliant, to wait
While ladies interpose and *boards* debate.

In connection with the Massachusetts prisons, three isolated facts offer themselves to the recollection of the present writer, not connected by any necessary chain of cause and effect with the system just described, but perhaps illustrative of it. During a debate concerning one phase of the prison question in the Massachusetts legislature on the 6th of May last, a Boston member, who had probably never seen the inside of ten among the 150 prisons of his State remarked complacently, and evidently with the approval of the house, that "Massachusetts had the best prison system in the world." A few weeks previous—in consequence of the acceptance of a gift by the highest prison superintendent in the State, at the hands of a contractor, who gave it for the manifest purpose of securing a favorable bargain for himself from the prison government—the last touch had been given to this perfect system, in the same legislature, by the passage of a law forbidding any prison officer to take bribes. And just a week after the speech above cited, that is on the 13th of May, the grandson of one of the most illustrious statesmen of Massachusetts in former years, a youth of amiable character, but unfortunate habits, was fatally burned in a Boston guard house, through the neglect of the policeman who had locked him up there, alone and helpless, and in the midst of combustible materials. Thus, on one side of the official eulogist is corruption in the chief officer of the highest prison, long undetected and still unpunished; while on the other side is a horrible casualty in the lowest prison, of which official negligence was the direct cause. It may not be unjust to consider these events as a commentary on the intricate prison system of Massachusetts, itself the successive growth of many years spent in trying to avoid what can alone govern prisons well, a central, simple, and vigilant method of control and inspection.

In the above statement some repetitions of what had before been said may be noticed; and also some additional facts and some discrepancies as to the number of county prisons. The latter result from the varying use of these prison buildings in successive years, and are only apparent discrepancies. In the main the passage quoted is still true to the facts; but should the recommendations of Governor Washburn and of the prison commission be accepted by the legislature, much of this ridiculous jumble of petty authorities would be done away with. The plan is to bring all the county prisons and the Boston House of Industry under State control, by establishing a system of district prisons, the details of which are set forth in the report of the Massachusetts prison commission—

ers for 1872, lately submitted to the legislature. The districts proposed are seven in number, of very unequal population and criminal conditions, but arranged with reference to the present county lines, and to the prison buildings, which will continue to be occupied, though with a different classification of prisoners, if the new plan is adopted. The districts proposed are Suffolk and Norfolk, with a population, in 1870, of 360,245, but now increased to 380,000, and containing four prisons, three in Boston and one in Dedham; Middlesex, with a population, in 1870, of 274,353, now increased to nearly 300,000, with two prisons, at Cambridge and at Lowell; Essex, with a population of 200,843 in 1870, now increased to 210,000, with two prisons, at Lawrence and at Salem; Worcester, with a population, in 1870, of 192,716, now increased to more than 200,000, and containing two prisons, at Worcester and at Fitchburgh; Southern Massachusetts, including the five counties of Barnstable, Bristol, Plymouth, Dukes, and Nantucket, with a population, in 1870, of 208,905, now increased to 215,000; the Connecticut Valley, including the three counties of Hampden, Hampshire, and Franklin, with a population, in 1870, of 155,432, now increased to 160,000; and Berkshire, the seventh and last district, with a population, in 1870, of 64,827, now increased to 68,000. The prison population of these seven districts, October 1, 1872, was 1,406 in the Suffolk district, 358 in Middlesex, 306 in Essex, 180 in Southern Massachusetts, (exclusive of 267 at Bridgewater,) 172 in Worcester, 136 in the Connecticut Valley, and 74 in Berkshire; in all 2,632, exclusive of the 829 at Charlestown and Bridgewater, under State control.

The Southern Massachusetts district will have two chief prisons, at New Bedford and at Taunton, with small jails at Plymouth, Barnstable, Edgartown, and Nantucket; the Connecticut Valley district two chief prisons, at Springfield and at Northampton, with a jail at Greenfield; and the Berkshire district one prison, comprising jail, work-house, and house of correction, under a single roof. In each of the six larger districts there is to be, by this plan, a work-house and a house of correction in separate buildings, and generally in different cities, the former for vagrants, drunkards, &c., who now make up more than half our convicts, and the latter for more heinous offenders. In each prison will be jail-cells, to be used as the jails now are, except that in Suffolk County the Boston jail will receive all such prisoners. Each of the seven houses of correction is to be governed by a resident master, appointed by the governor and council, and each master is to appoint a resident deputy to govern the work-house in his district. The jails are to remain in part under the control of the county sheriffs, as at present.

The new scheme is by no means free from complications and inconsistencies, and is probably too extensive to be carried as a whole; but it is a great improvement on the present system, and some part of it will probably soon be adopted. Gradually the superior advantages of district prisons over county prisons will be seen, and the so much needed classification of prisoners, now almost wholly neglected in Massachusetts, can in time be attained. With that will come better prison schools, a better-organized system of labor, and more thorough and therefore more successful efforts to make our prisons truly reformatory. At present they are so only to a very slight degree; nor do they perceptibly check crime, which, since 1864, has apparently increased in a much greater ratio than our population. In 1865 there were less than 2,000 inmates of all the Massachusetts prisons; five years later, October 1, 1870, there were 3,121; at the same date in 1871 there were 3,224; in 1872, 3,461; and at the beginning of 1873 about 3,280, as has been said. The average

prison population in 1870, was 2,971; in 1871, 3,145½; and in 1872, 3,218. There has, therefore, been in seven years an apparent increase of more than 60 per cent. in the number of criminals, while the population has not gained more than 25 per cent.

Prisons for women.

There is not in Massachusetts, nor has there ever been, a distinct prison for women, though the average number of women in prison here has been from 600 to 800 for the last eight years. Of the prisoners in confinement October 1, 1870, 754 were women; at the same date in 1871, 758 were women; October 1, 1872, there were 770 women in prison. The recommendations of Governor Washburn, seconded by the prison commission, include the conversion of the State work-house at Bridgewater into a State prison for women alone, to which those now in the county and city prisons would be sent. It is probable that this plan, which meets with much popular favor, will be put in practice the present year.

Prison schools.

Little has yet been done in Massachusetts to give school instruction to prisoners. The importance of this branch of prison discipline has been urged upon the legislature and the prison officers by the board of State charities ever since 1865, and, in consequence, a few prison schools have been opened. That at Charlestown is the largest and the most useful, but is far from equaling, either in plan or management, the excellent schools of Mr. Brockway, at Detroit. In the county prisons and at the Bridgewater work-house a few prisoners have received instruction. But the officers, as a rule, do not understand the necessity for prison schools, and the contractors are practically opposed to them. Should the proposed changes in our prison system be made, the education of prisoners could and probably would be much better cared for.

Cost of our prisons.

The cost of the present prison buildings and lands, incurred during the last seventy-three years, cannot have been less than \$3,000,000, although an exact computation is impossible. About a third part of this sum has been paid for construction, enlargement, &c., at the Charlestown prison alone; and the estimated cost of a reconstruction of that prison at Newton, or in some other convenient locality near Boston, is a million of dollars, to be re-imbursed in great part by the sale of the estate at Charlestown. The annual interest on \$3,000,000 is \$180,000, or an average for each prisoner of more than \$50 a year, or about a dollar a week. The actual current expenses of the prisons above named, for the year ending October 1, 1872, were about \$511,000, to which, if we add the cost of maintaining the one hundred and thirty town and city prisons for temporary detention or occasional sentence of petty offenders, we shall have a total of about \$550,000. From this should be deducted the earnings from labor of convicts, fees of visitors, and petty sales, amounting, in the year 1872, to about \$275,000; leaving, as the net cost of maintaining some 3,300 prisoners, (the constant average,) about \$275,000, or more than \$80 each. This is a larger net cost and a greater number of prisoners than for several years past, but the prison earnings are also greater than in any year before. In the county prisons these earnings have very much increased since

the close of the war. In 1865, with an average number of 1,050, the county prison earnings were but \$34,694; in 1868 they had more than doubled, being \$69,625 for 1,554 prisoners; and now they have almost doubled again, being \$129,186 for 1,850 prisoners. Yet even now they are from \$50,000 to \$100,000 less than they might be if the county prisons were properly classified, and the most thorough labor system employed. We see that 543 convicts at Charlestown have earned almost as much as 1,850 in the county prisons; or to be more exact, as much as 1,370 convicts in 16 houses of correction, for the jail prisoners, mostly waiting trial, are not compelled to labor. There is no good reason why, with the exception of these jail prisoners, averaging from 400 to 500, and costing from \$75,000 to \$100,000 a year for their support, the whole annual cost of our prisons should not be paid by the labor of the convicts, who would thus become self-supporting. Few of them are too feeble to do any work, more than two-thirds of them are men, and the demand for such work as they can do is constant and remunerative. The largest contractors for prison labor in the State, the Tucker Manufacturing Company, who grumbled because the authorities made them pay \$1 a day for skilled mechanics, have lately paid to another contractor \$15,000 for the right to use his 100 men at 90 cents a day, for a single year. This is about 50 cents a day additional, or \$1.40 for each man, which the state prison inspectors say is a fair contract price for them. Probably they earn for the contractor at least \$2 a day. In the county prisons the labor is not so well trained nor so valuable, but at the South Boston house of correction the whole number, some 450, both men and women, earn their support, and something more; and the surplus that might be earned by the strong and more skillful would make good the deficit on the weaker and worse trained workmen in the county prisons. At the same time, such a classification of the convicts as would make their labor most profitable would render it easier to give them school instruction, religious discipline, sanitary advantages, and all that tends to make prison life reformatory.

The reformatories.

If an examination of the Massachusetts prisons is far from satisfactory, and shows that they need immediate and thorough re-organization, this is by no means the case with the reformatories for young offenders. These were never in so bad a condition as our prisons, and they have been for several years growing better, and doing their work more thoroughly. The nautical reformatory, or school-ship, which had outlived its usefulness, and become a burden instead of a help to the reformatory work of the State, was finally abolished in July, 1872; the preventive institution at Monson, known as the State Primary School, established by law in 1866, has gone steadily forward in a very useful work; while the "Visiting Agency," providing homes in families for young delinquents, and neglected or orphan children, has almost revolutionized the old policy of the State and of the courts. All these changes may be said to have grown out of the action taken by the board of charities, which first established a visiting agency in 1866, in connection with the Monson Primary School, and first called attention to the defective condition of the nautical reformatory in the same year. In the six years that have since gone by, such changes have taken place as would scarcely be credited but for the unimpeachable evidence of statistics. In 1867, when the new policy first began to take effect, the average number of pupils at the State reformatories was 752, and the

sum drawn from the State for their support was more than \$140,000; in 1872, the average number of pupils was but 464, including 75 on board the school-ship, and the sum drawn from the treasury for their support was but \$96,695, including \$23,703 for the school-ship, now abolished. During the current year, 1873, the average number of pupils will scarcely equal 400, and the sum drawn from the treasury will be but little more than \$70,000, or half what it was six years ago. In the mean time our population has increased about 200,000, while juvenile crime has decreased. Especially since 1870, when the existing visiting agency was established by statute, and had its powers greatly enlarged, this decrease has been manifest. On the 1st of October, 1869, there were 97 children under seventeen in the county prisons; a year later there were but 54; in October, 1871, but 33, and on the 1st of last October only 25. At the same time there is at least twice the personal attention given by public officers to the circumstances and temptations of young offenders and neglected children; the moral condition of the whole class from which these culprits come receives more consideration, both from the authorities and the community in general; and the result, as we now see it, is eminently gratifying. The reports of the State Visiting Agent, Mr. Tufts, may well be consulted for further information in regard to the new policy in Massachusetts, and its good effects. This policy is based upon the belief that much of the vice and crime among the young comes from a lack of attention to their individual circumstances, and the want of a good home; and the main object of the State, in its dealings with neglected and culpable children, is to find them good homes. This is done to a much greater extent than formerly, and the persons who receive these children are so held to such a constant responsibility, that the abuse of children placed out from the public establishments is much less than it used to be. The State pays less money, the community is better protected from juvenile crime, the children themselves are better cared for, and their employers are kept from injustice and the oppression which "maketh a wise man mad"—much more a child who has little chance to learn wisdom. While there are still many evils to be corrected, and some that may have come in with the new policy, its general results are everywhere acknowledged to be happy.

The State reformatories.

There are now but two of these: the reform school for boys at Westborough, founded by the late Theodore Lyman, in 1848, and still aided by a portion of his endowment, but mainly supported by the State; and the industrial school for girls, at Lancaster, founded in 1856. The school-ship, or nautical reformatory, established in 1860, was closed in July, 1872, and a few of its boys are still held in confinement at Westborough. The limit of age for admission at Westborough, which used to be fourteen years, is now seventeen, and, on the other hand, fewer young boys are sent thither. The consequence is that the average age of the inmates is considerably increased, and when the board of charities last visited Westborough, (January 14, 1873,) more than three-fifths of the 303 boys present were over fifteen years old. The average age of admission would seem to be now about thirteen and one-half years, or from one to two years greater than formerly. During the year ending October 1, 1872, the whole number at any time in the school was 474; but of these only 90 were new commitments, 43 were received from the school-ship and from Monson, and 69 were returned to the school from various places. The average number during the year was 267; the number

October 1, 1872, was 254; and January 1, 1873, it was 297. The establishment, as for several years past, has a main building where about 200 boys are kept together, under lock and key, and three family houses, in which about 75 boys are generally kept and trusted with greater freedom. There are seven school-rooms, and during most of the year seven schools are kept up. The labor of the boys is about equally divided between the farm of 263 acres and the mechanical work of chair-seating. The cash earnings from labor in 1872 were \$8,113, or about \$30 for each boy. For the current year they are likely to be \$10,000, being \$2,600 for the first quarter of the official year, from October, 1872, to January, 1873. The whole expenditures in 1872 were \$50,534, including \$1,369 paid from the income of the Lyman fund, now amounting to more than \$30,000. From this should be deducted the earnings from labor and sales, amounting to \$8,488, leaving the net cost of supporting 267 boys \$42,046, or about \$3 a week for each boy. Of this net cost, however, the State treasury paid but \$33,375, the sum of \$7,302 being paid by cities and towns for the partial support of their boys, and \$1,369 coming from an invested fund.

The girls' industrial school at Lancaster is conducted wholly on the family system; the 122 girls, making up the average number for 1872, residing in five family houses, each under the charge of a matron, and each containing a school and school-teacher. The whole number at Lancaster during the year was 171; the number, October 1, 1872, was 121; and January 1, 1873, it was 128. Much attention is paid to the school exercises and to religious instruction, less to labor, especially to productive earnings. The age of the pupils increases, as at Westborough, and for similar reasons. In both schools the difficulty of managing and reforming the pupils is thereby increased. A majority of the girls at Lancaster are now persons who have lost their chastity, and a considerable number of them have been prostitutes. In this respect the school has changed for the worse; but it probably renders as great a service as ever to the community. The average age of girls when committed is about fourteen, and they remain for about two years at Lancaster, on an average. A farm of 185 acres is connected with the school, but the girls do little in horticulture or the care of the dairy. For their support in 1872, \$23,987 was drawn from the State treasury, and may be assumed as the cost of the school for the year. The earnings from labor were \$543.63, or nearly \$4.50 for each girl; the net cost for the year was about \$22,776, or \$3.60 a week for each girl. The towns and cities paid \$3,280, however, so that the net cost to the State treasury was about \$19,500. During the present year the net cost of both the State reformatories to the State treasury will probably be but little more than \$50,000, while the cities and towns, which now pay about a sixth part of the expense of the children sent from them, will contribute some \$10,000 more, and the income of invested funds will add \$1,500 more.

Both the State reformatories are managed by boards of trustees, seven at Westborough, and five at Lancaster, appointed by the governor of the State. The other large public reformatory, the Boston house of reformation, which dates back to 1826, is controlled by the city "board of directors for public institutions," who also manage the city prisons. With one of these prisons the house of reformation is connected, being situated on Deer Island, in Boston harbor. The boys in this reformatory are under the same roof with the house-of-industry convicts, but the girls are in a smaller house close by. The

whole number of pupils in a year is about 500, of whom about one-eighth are girls.

The average number in 1872 was 312; and the number January 1, 1873, was about 300 of both sexes. No earnings are separately reported in this reformatory, nor is its annual cost very exactly given; it is probably about \$35,000, or somewhat less than at Westborough. The number of pupils in these three reformatories at the present time is not far from 720; a few years ago it was more than 1,000 in the four large public reformatories then existing. At Lowell and several of the other cities there are small municipal reformatories or truant-schools, to which juvenile offenders are sentenced; the average number of such sentenced children in the whole State is perhaps 100; making above 800 children now held in public reformatories. The "House of the Angel Guardian" is a private Catholic reformatory, with, perhaps, 175 boys in it, but they are not under sentence. It is located at Roxbury, within the city limits of Boston.

Preventive agencies.

The most important means of prevention furnished by the State to check juvenile crime are the State primary school at Monson and the State visiting agency, both dating from 1866, but the latter established by special law only since 1869. This has already been spoken of, and any further information concerning it that may be needed will be found in the annual reports of the board of charities, of which it is a department. The Monson school holds a place of its own among the public establishments of Massachusetts, and, since last June, when it was separated from the almshouse with which it had been joined, to its great disadvantage, has a special claim upon the consideration of persons who have at heart or on their hands the care of poor children. The Monson school is filled with sons and daughters of the poor—children who, if neglected, would grow up to be paupers and criminals, as many of their relatives have. Formerly such children were themselves esteemed paupers and treated as such; now they are by law, and will soon become by custom, the State's wards and pupils, free from any stigma of pauperism, and often outgrowing their hereditary tendencies and the unfortunate associations of their early childhood. The school now occupies exclusively the premises of the former State almshouse, and has a farm of 230 acres. The buildings have been thoroughly repaired and greatly improved; they are now warmed by steam, lighted by gas, supplied with a new laundry, bath-rooms, and other conveniences—none of them too good for the use of these poor children. The number of different pupils during the year 1872 was about 570; the average number 361, the number remaining October 1, 1872, 341, and on January 1, 1873, 357. A little more than a fourth of these pupils are girls. Their average age is between nine and ten, and few are allowed to remain beyond the age of sixteen. They are sent to Monson from the State almshouse, or placed there by the visiting agent, when he believes they do not need the restraints of Westborough or Lancaster, and has no family on his list suitable to receive them. The average attendance in the six school-rooms during the year was 344; the cost of supporting the pupils of the primary school was something more than \$40,000, which was paid wholly from the State treasury. The labor of the pupils does something to diminish the cost of their maintenance, which is about \$2.50 a week for each child; but their cash earnings have been small and are not likely to increase greatly. The superintendent is now about to introduce the

same employment that is pursued at Westborough—chair-seating. It is the rule of the establishment to place the pupils in families, as soon as they can be provided with suitable places, which prevents the long continuance in school of any except the very young or the less desirable children.

The Boston farm school is a private charity, receiving and supporting about one hundred poor children at a time. It has existed nearly forty years in its present form and location, Thompson's Island, near South Boston, and exercises a good influence, so far as its means extend. Its pupils are not under sentence, nor are they boys who have committed offenses, generally speaking. In this respect they resemble the pupils at Monson; but the farm-school boys are of a better stock, physically, mentally, and morally, than those at Monson. There are other private charities, orphan homes, &c., which do in a less degree, and for younger children, what the farm school does.

Discharged prisoners.

There are two societies in Massachusetts which aid discharged prisoners; and both have in former years received State appropriations. The older is the "Prisoners' Aid Society" or "Agency for Discharged Convicts," to which the State in 1871 made an appropriation of \$3,000, the greater part of which went to pay the salary of the agent. The other is a society in aid of women discharged from prison, and maintains the "Temporary Asylum for Discharged Female Prisoners" at Dedham. Both societies are doing a good work on rather a small scale, but more and more each year. Could these agencies be connected, as they are in Ireland, with the government and the school-instruction of the main prisons, more could be done by them to assist the convict in regaining by an honest course the good opinion of society.

Few general remarks have been made in this report, because the whole subject of our penal and reformatory establishments has been frequently discussed in the reports of the board of charities and the prison commissioners. Mr. Edward L. Pierce, secretary of the board, who conveys this paper to the congress, has made himself familiar both with the principles and the details of the subject-matter, and will doubtless answer any questions or make any explanations which may be desired.

10. MICHIGAN.

By Hon. C. I. Walker, chairman of the board of commissioners for the general supervision of penal, pauper, charitable, and reformatory institutions of the State of Michigan.

The State of Michigan ranks eleventh in population of the States of the American Union. It is rapidly growing, having increased the number of its inhabitants more than one-third within the last ten years. It has a fertile soil, is rich in agricultural and mineral wealth, is traversed by a net-work of railroads, and nearly encircled by inland seas, giving it commercial advantages which but few States possess. Its laws are liberal, and bespeak an advanced public sentiment, many of the old forms of jurisprudence, like capital punishment and the grand-jury system, having been abolished, and with favorable results. Its institutions are established upon a broad basis, and wisely adapted for such improvements as time and experience may prove worthy of adoption.

Within the last year crime has decreased within its limits, a result, perhaps, in a great measure due to the increased efficiency of these institutions, and to the use of more effective means for the proper discipline of offenders.

The preventive and penal system of the State for the repression of crime may be summed up in brief as follows :

First. Prevention of the increase of criminals, by provision, through a State institution, for the training and education of truant, vagrant, and dependent children ; they being the great source from whence crime draws recruits to its ranks.

Second. The reform school for juveniles of tender years, who have actually committed crime, and whose guilt has been duly proven.

Third. The jail for the detention of prisoners, arrested and charged with the commission of crime, until they can be tried ; and for the safe keeping of such as have been tried and found guilty, until they can be conveyed to the place of punishment ; and for the imprisonment of petty offenders.

Fourth. The Detroit house of correction, as an intermediate prison or work-house for persons convicted of minor offenses or of grave charges, who give hope of reformation.

Fifth. The state prison for confirmed or dangerous criminals, convicted of high crimes.

[N. B.—At this point, the report goes at some length into a statement of the character and objects of the first of the above-named institutions. A special report on the same subject was also handed in by the Hon. C. D. Randall, secretary and treasurer of the commissioners in charge of the institution, who, as chairman of the joint legislative committee of 1871, on penal, reformatory, and charitable institutions, was chiefly instrumental in originating this very important agency in the prevention of crime. But, as Mr. Brockway, reporting for the committee on prison discipline, (see p. 332,) has fully explained this institution, both statements are omitted here for economy of space.—E. C. W.]

The reform school receives boys between the ages of ten and sixteen years who have been convicted of the commission of crime. They are sent to the school until they reach the age of twenty-one years, but most of them are discharged long before they arrive at their majority, being retained in the institution only an average period of about three years.

Farming has received a large share of attention, and many of the larger boys are mainly employed at it.

The institution is designed to reform rather than to punish those committed to its charge, and religious and secular instruction, as well as labor, are relied upon as prominent agencies in the work of reclamation. Every boy is required to attend school a stated number of hours each week day. Excellent progress is made. There is a fair library and picture gallery attached.

This institution is conducted on the congregate and family system combined. In addition to the large buildings occupied by most of the boys, two "family houses" receive the better class, who are graded into them, and there have more freedom and nearly all the privileges of a good home. They eat at the same table with the family, have large bedrooms, and are treated quite as well as boys generally are on a good farm. The school is doing an excellent work in saving numbers from a life of crime.

The State of Michigan is divided into seventy counties, most of which have jails. The jails contain an average population of about three hundred persons, and for their superintendence and care employ a force of

about one hundred and fifty persons. In construction and appearance they are very unlike. They vary from the cheap log pen to expensive, showy, and imposing edifices, some costing less than one hundred dollars, others fifty or sixty thousand. In the majority of them the safe-keeping of prisoners seems to have been the principal object in their construction, yet most are insecure for the detention of skillful and dangerous criminals. Breaking jail is of frequent occurrence, and without a great deal of watching, the adroit rogue is quite apt to find his way out.

A small cell, destitute of furniture or decent bedding, fronting on a hall or corridor five or six feet in width, without much light or proper means of ventilation, and so constructed as to deprive the occupant of a full supply of that necessity to health, pure air, constitutes the apartment generally provided for a prisoner. In some of them two, and even three, persons are lodged in bunks, one above the other. The air in these cells is frequently foul from the odors of the privy, and the supply of light in many of them is so insufficient that those confined therein can only with difficulty see to read in the day-time. In some of the jails prisoners are locked up in the cells (many of which are damp and musty) all the time, but in the most of them they mingle together promiscuously in the corridor during the day, and are only locked in separate cells at night.

The prisoners have no work, no instruction, nothing to do but to amuse themselves as best they can. Here are to be found in intimate association the old offender and the wayward youth, the former relating his exploits, glorying in his crimes, and inspiring the latter with a desire for similar adventures. The novice is thus made familiar with the "tricks of the trade," and goes forth prepared to operate with all the skill of the accomplished rascal, save experience.

In the best and most expensive jails, as well as in the poorest, this association is of daily occurrence. In the most costly, during the present year, we have witnessed wayward little girls caged up with notorious prostitutes, and truant boys made the companions of degraded and desperate characters. In the very nature of things, imprisonment without labor, and the unrestrained association of offenders of different grades, must have the effect to increase rather than diminish the number of criminals.

While most of our jails are tolerably clean, some of them scrupulously so, there are others that are in a filthy condition—dirt, vermin, and disorder reigning supreme. Scarcely any have bathing facilities, and in some, water for the ordinary purpose of washing the hands and face is not always to be had.

In not a few of the jails prisoners are required to wash and iron their own under garments, or go without clean clothes; and some under such circumstances have gone for months without clean shirts. The effect of confinement under these circumstances is to make men filthy and degraded.

Persons violently insane may frequently be found in our jails for the want of other places for their safe-keeping; and in some of them there is no provision for a separation of the sexes.

Witnesses and debtors, guilty of no crime whatever, are sometimes for months shut up with the vilest felons, and the innocent and the guilty are thus mixed together. Instead of presuming every man innocent until he is duly tried and his guilt proven, our manner of treating men in jail who are awaiting trial seems to presume them guilty and sent to the jail for punishment instead of detention. A large proportion of those commit-

ted are, on examination or trial, acquitted, and thus innocent men merely suspected of crime are thrown into these jails, and caged and cared for in a manner disgraceful to our civilization.

These statements briefly present the true condition of many of our jails, and we think an examination of them must satisfy any fair-minded man that, as generally conducted, they are simply training schools to make adepts in crime. We have yet to learn a single instance where a person has been bettered or reformed by a committal to jail, while, on the other hand, we can point to numbers who we believe have been made worse thereby.

The Detroit house of correction, although a municipal prison, owned and controlled by the city of Detroit, in which the State has no direct interest of ownership, is nevertheless entitled to be ranked among the foremost of our State penal institutions, for the reason that it receives annually from all parts of the State, as well as from the city of Detroit, criminals convicted of misdemeanors, and forms one of the most important links in our whole prison system, being especially adapted for that class of offenders who ought not to be committed to the jails or to the state penitentiary. Besides, this is the only prison that receives to any considerable extent the female convicts of the State. It has acquired an extended reputation, and is recognized throughout the country as a model institution of its kind. With a superintendent who has made the management of prisons not only a study but the practical business of years, devoting all his best energies to the work, this prison has been in many respects a remarkable success.

The house of correction has not only proved self-sustaining, but during its nine years' existence has earned \$103,000 over and above current expenses of every kind.

Prisoners in this institution are principally employed in the manufacture of chairs and cigars. The contract system is not adopted. The superintendent purchases stock, causes it to be made up, and, when manufactured, disposes of the goods.

The discipline is very simple. Obedience, order, and cleanliness are strictly enforced. There are no grades in the male department, and none, unless it be a transfer to the house of shelter, in the female department. Rewards for good conduct are used only to a very limited extent, the privilege of over-work, or a chair, or some other little article of cell-furniture, being about the only stimulus of this kind given to the prisoners. The prison dress is not in use, and flogging with the lash or otherwise has been abolished.

The educational training which this institution gives to its inmates is one of its most distinguishing and excellent features.

The house of shelter, established in connection with the house of correction, to which female prisoners from the latter are transferred for good conduct, is a commodious and well-furnished home, provided with all the comforts and conveniences of a well-to-do family. Here is a company of wayward girls taken from bad influences, forming a little society of their own, and by industry, education, and refining associations, fitting themselves for lives of respectability and usefulness. Each inmate is provided with an ordinary-sized bedroom, fitted with the furniture usually found in a room of this kind. They take their meals together at a table in the dining-hall, covered with a neat table-cloth, and furnished with excellent table ware and napkins. Most of the day is devoted to work, mainly sewing and making linen coats and pantaloons. Singing, music on a parlor organ, evening school and reading, with a weekly evening gathering for conversation and social entertain-

ment, constitute the principal exercises. Culture of this kind, amid such surroundings, cannot fail to be productive of great good in preparing those who receive it for useful home life, and we cannot but regard the house of shelter as one of the best agencies for saving those likely to fall that it has been our province to find.

The success of the Detroit house of correction seems to us not so much due to the adoption of any particular system for the government of its inmates, unless it be the extraordinary efforts in the direction of education, as to the zeal and efficiency of the superintendent. Mr. Brockway is, emphatically, the head of the institution, and every department of it is pervaded with his enthusiasm and inspiration. He has shown himself one of the most active, intelligent, and zealous of the prison men of the country, being among the foremost in the great work of prison reform, and it is matter of deep regret that he is about to sever his connection with the establishment.

The state prison is the principal penal institution of the State, and is nearly as old as the State government, having been established in 1839, three years after the admission of Michigan into the Federal Union. Located at the city of Jackson, in the central part of the State, amid a net-work of railroads, it is convenient and easy of access. The prison grounds embrace some thirty acres of land within the corporate limits of the city, and the prison walls, which have recently been reconstructed in a good and substantial manner, inclose about ten and a half acres.

The system of imprisonment is that known as the congregate or Auburn. The prisoners work in association by day, under the rule of silence, and at night are locked up in cells, some of which have been carpeted and ornamented with pictures in a very tasty manner by the convicts occupying them, thus showing that even behind prison bars men still appreciate and enjoy order and beauty.

The prisoners labor about an average of nine hours each week-day during the year, in workshops within the inclosure. The principal business carried on is the manufacture of furniture, wagons, agricultural implements, cigars, boots and shoes. The labor of the convicts is let to contractors, who, at fixed periods, of which due notice is given, bid and compete for it. The present rates paid for this labor range from 50 to 76 cents per day for each man.

Tasks are assigned to many of the men, which they accomplish before the close of working hours. The remainder of the time they generally spend in idleness.

In their last report the inspectors of the prison say: "The discipline of the prison has been greatly modified and improved within the past year. Kind but decided and firm treatment has been employed as the principal means of control, and we think with decided success. Infractions of the rules have been less frequent, and there has been a gratifying decrease of the necessity for severe punishment. Good order has been maintained and punishment seldom required. No class of men appreciate kindness and humane treatment more than convicts do. Shut out from the world, and deprived of the ordinary privileges of life, they carefully note and remember every little kindness, and we believe are more easily and better governed thereby than by the use of harsher means. We have heard discharged convicts, about to go from the prison, recount the little kindnesses that have been extended to them, and seen them with tears of gratitude in their eyes thank the officers for the interest they had manifested in their welfare. We have made it a point, as far as possible, to ascertain what we could with respect to the conduct of

such as have gone out of the prison, and we are happy to be able to state that the great majority have so conducted themselves as to give the assurance that they will in the future lead better lives. Only a very few have returned to their former practices."

The ordinary and most frequent punishment is the bare cell and short rations; for more flagrant offenses an addition of tying the hands behind the body and fastening them to the cell door. As a last resort, for personal violence or a deliberate outrage, the lash is still held in reserve, although the instances for its use are seldom found necessary. Whenever convicts have, or conceive that they have, cause of complaint against officers or any free men, they are always at liberty to bring their complaint to the agent.

A system of rewards has been devised and partly put in effect, so that now, at the end of each month, the convict who has conformed to the rules of the prison receives a card, as evidence of good behavior. Officers say that it is astonishing to see how the men prize these cards, treasuring them up, or sending them away to their families; and that the effect of these little rewards is excellent in controlling the prisoners and stimulating them to good conduct. Again, some of the old features of prison life, tending to destroy the self-respect of the imprisoned, have been removed, and the change seems to work well. Thus the rule requiring the men to labor with their eyes constantly upon their work has been modified, and there is no longer that downcast, "hang-dog" expression which formerly seemed to be peculiar to each convict.

There has also been greater infusion of educational agencies. An hour on each Sabbath is now devoted to secular instruction, and numbers of convicts who came into the prison unable to read or write, through the training of this school, have acquired these primary elements of education. Interesting lectures and readings are more frequent than formerly, and many of the men, stimulated by the desire thus created for good reading, have voluntarily given up the use of tobacco for the privilege of becoming regular subscribers to some one of our leading monthly magazines. Twice a week, after dinner, the agent selects and reads for fifteen minutes to the prisoners in the dining-hall some interesting and instructive piece.

The prison continues the practice which it some years ago inaugurated, of giving special privileges to its prisoners on public holidays. The custom is believed to be beneficial, making the convict more cheerful, and impressing him with a conviction that an interest is still felt in his welfare. An excellent dinner and short addresses constitute the order of the day on these occasions. Of the effect of the observance of these holidays the agent says: "I am satisfied that in the manner we have conducted them they have in no way impaired or relaxed the general discipline, while, on the contrary, the presence of good men and women, reading, talking, and singing, assures them they are not entirely cut off from all human sympathy. The whole tendency of these hospitalities is to engender and enliven the kindlier feelings and sympathies." For several years the prison has been self-supporting, paying by its earnings all its current expenses.

The public mind of the State is beginning to manifest more interest in the work for which this congress has assembled. Men and women within our borders are helping to create an improved system of prison discipline, worthy of our civilization. We have reason to anticipate favorable legislation in relation to many of the topics suggested. And it is an especial cause of congratulation that our efficient governor is in full and hearty sympathy with us in the cause of prison reform, and in

the improved care demanded for all the wards of the State, and we have strong faith that the good work will go on until these desirable results are fully accomplished.

11. MINNESOTA.

By Professor William F. Phelps, President of the State Normal School.

Minnesota was admitted into the Union in May, 1858. Hence, its institutions of every kind must be regarded as yet in their infancy. None but those who have participated in the struggle can have any adequate conception of the difficulties and embarrassments attending the efforts to build up these institutions on just principles in frontier States, composed of heterogeneous elements gathered from almost every quarter of the globe. Of course it is expected that in new communities man's earliest efforts must be put forth for the supply of his material wants, and for his protection against the destructive tendencies of natural forces. But he also soon finds himself compelled to guard against the ravages of the rapacious and vindictive passions of his fellow-men. Hence penal institutions are, unfortunately, among the *prime necessities* of a State, while yet its resources are undeveloped and the views of its people are as diverse as their origin and the circumstances under which their opinions have been formed. These conditions inevitably lead to inadequate, conflicting, and unwise legislation, rendering it quite impossible to provide those comprehensive and far-sighted arrangements so necessary to secure the reformation as well as the proper restraint of the vicious and the criminal at a time when, above all others, such measures would prove the most potent in tempering the spirit and shaping the policy of the institutions, which are to be as enduring as the State, and which are, indeed, to become a part of the State itself.

Population and commanding position.

The population of Minnesota at the present time is 527,500, or more than three times as great as in 1860. It is situated on that central line which is nearly equidistant from the two great oceans. The head of the "unsalted sea," which is also the beginning of the chain of lakes reaching through the Saint Lawrence to the Atlantic, and the source of the Father of Waters, connecting it with the Mexican Gulf, are alike within its boundaries. Through the Mississippi it stretches forth its hands to the tropical, while through the Red River of the North and its connections it reaches to the Arctic zone. The Northern Pacific Railroad, opening up the shortest and easiest pathway "across the continent," has its eastern terminus, with its numerous branches, within the borders of the State, whose area is more than 83,000 square miles, and whose ample domain is capable of sustaining a population equal to that of half of the entire United States at the present time. The Canadian Pacific Railway, whose construction will undoubtedly be commenced near our northern frontier, and be vigorously prosecuted during the present year, will have its connections with the vast system already spreading its iron net-work over our prairies, and thus making our territory teem with the commercial life of two hemispheres. These facts have a tendency to give to the State a prominence and an importance that are keenly appreciated by its leading minds, and by those who,

while struggling to shape the policy of its institutions, are laying the foundations of a future whose influence must be little short of illimitable.

The institutions of Minnesota.

The institutions at present existing, which bear upon crime and are under the immediate care of the State, are: I. The educational, or preventive. II. The benevolent, or humane. III. The penal and reformatory.

I. *The Educational Institutions* consist: 1. Of the State University at Saint Anthony, with 250 pupils, and maintained at a cost to the State during the past year of \$21,000. 2. Of three State normal schools for the special training of teachers, located respectively at Winona, Mankato, and Saint Cloud, and giving instruction during the year 1872 to more than 500 embryo teachers. The current expenses of these seminaries defrayed by the State last year were \$25,000. For the present year they will amount to \$30,000. The amount expended upon buildings already erected and in progress is more than \$200,000. 3. Of 3,000 common schools, scattered throughout all the organized townships, including numerous high schools in the cities, which have already attained a standard of commanding excellence. The number instructed in these schools during the past year was 120,352, at a cost of about \$1,000,000; while the number totally uninstructed and left to recruit the "ignoble army" of illiterates in the State, was 59,668. The productive school fund now amounts to \$2,780,559, being the fifth in magnitude in this country, with six-sevenths of the "school-lands" from which the fund is derived are yet unsold. The increase in the number of common schools last year was about 200.

These facts are brought forward here on account of the vital relations which exist between education and crime, between the preventive and the penal institutions of a State—relations which, in all our discussions of the latter, should be distinctly recognized. A *true education* is the surest preventive of crime, and no *reformation* can be effective or permanent which does not address itself to the *enduring soul* of the fallen being.

II. *The Benevolent Institutions.*—These comprise the hospital for the insane at Saint Peter, the institute for the deaf and dumb and the blind at Faribault, and the soldiers' orphans' home at Winona. These institutions are all projected and supported on the most liberal scale, and are conducted according to the latest developments in the medical and educational sciences.

III. *The Penal and Reformatory Institutions*, comprising: 1. The state prison at Stillwater, on Lake Saint Croix. 2. The State reform school for both sexes, near Saint Paul. 3. The jails established and supported under county supervision.

1. *The state prison.*

Location.—The buildings for this institution are located at the mouth of a short ravine, between two high and deep bluffs fronting on the lake, and running back to a point of junction with the main ridge of which the bluffs are spurs. This ravine comprises about four acres of ground. The foundations of the buildings rest upon piles driven into the marshy soil beneath. The sum of \$125,000 has been expended upon the build-

ings, and \$40,000 more will be used during the coming year in improvements.

History.—This prison was established and located in 1858, the year in which the State emerged from its territorial condition. There were at that time but three "prominent points" in the State—Saint Paul, Saint Anthony, and Stillwater. Saint Paul had the capital; Saint Anthony secured the university, and Stillwater the state prison. In those early days the location of State institutions was controlled less by public than by private considerations. The selection of the grounds for the state prison was singularly unfortunate.

Buildings and grounds.—There are but two permanent buildings occupied by the prison. They are located on opposite sides of the inclosed space near the base of the bluffs forming the ravine. The main prison building is on the left of the space inclosed, and is about 210 feet long by 40 in width. This contains the cells, (a portion of which extend to the third story,) the domestic department of the institution, the officers' quarters, and the family of the steward; the cells themselves being in the rear. It is built of limestone, and is very substantial and neat in appearance. The other building, which is on the right, and further to the rear, is also of stone, and two stories high, with basement. This contains the workshops, store-rooms, and engine and boiler rooms. There is a wall along the front of the premises, and the three other sides are inclosed by a plank fence some 12 or 15 feet high, flanked by a walk for the sentries, and surmounted by guard-houses for those officers when on duty. A sewer, as yet quite inadequate to meet the necessities of the prison, passes through the grounds and discharges into the lake in front. The cells are ventilated by small tubes connecting with shafts passing through the roof.

System of management.—The associate system of labor is employed. The convicts work in groups in the several shops under the supervision of an overseer or foreman, and a guard. In all other respects the cellular system is adopted. The food is taken exclusively in the cells, and the men are constantly confined, excepting during the hours allotted to labor.

General administration.—The prison is under the general supervision of a board of three inspectors appointed by the governor, by and with the advice and consent of the senate, for three years, one member retiring each year. The warden is appointed in the same manner. All the subordinate officers are appointed by the warden, excepting the chaplain and the physician, who are selected by the inspectors. As is usual in such cases, political considerations influence more or less the selection of these officers. It is but just, however, to say that all the officers of the institution have been chosen with excellent discrimination and good judgment.

System of labor.—The contract system of labor prevails in the prison. The existing contract extends through a period of nine years, the price being 45 cents per day for each man employed. Ten per cent. of the convicts are reserved for the uses of the institution in its domestic department. The branches of industry pursued are few and simple, being limited principally to the production of wooden ware, barrels, window-sashes, doors, and a small amount of cabinet and carpenter work. The average duration of a day's work is ten and one-half hours throughout the year, although in the winter season only eight and one-half hours are occupied. In cases of over-work, which are, however, rare, the convict is allowed to participate in his earnings.

Discipline.—The discipline is firm yet mild and eminently humane.

As a general rule, talking is prohibited among the convicts, except in cases where it is necessary in carrying forward the work. The officers exercise a kind and paternal influence over the unfortunate men under their charge. Cheerfulness prevails to a remarkable degree among the convicts. They appear in this respect more like laborers working for wages and enjoying the fruits of their toil than like men convicted of crime and undergoing the deprivations of penal servitude. There seems to be an entire absence of that feeling of sullen depression so characteristic of convicts submitting to the rigors of an iron rule.

Punishments.—Corporal inflictions are never resorted to. For the graver offenses, confinement on bread and water until penitence is secured is the principal reliance. The ball and chain, as a penalty for attempts to escape, is imposed upon the more incorrigible. But all those forms of punishment calculated to inflict bodily torture or create a sense of indignity are entirely discountenanced and avoided.

Incentives to good conduct.—Under a law of the legislature, passed in 1867, a convict may abridge the term of his sentence by exemplary conduct. By the terms of this act two days may be deducted for the first month of good behavior, four days for the second, and six days for each succeeding month, provided that the right to such deductions is not forfeited by subsequent misconduct. Restoration to citizenship through the pardoning power follows a continuous course of unexceptional behavior.

Pardons.—The governor of the State has the authority to pardon a criminal before the expiration of his term of sentence. This power is sometimes exercised on the recommendation of the warden for good conduct, sometimes through petitions of influential citizens, pleading mitigating circumstances, and the like. The commanding general of the department of Dakota has occasionally pardoned prisoners incarcerated for military offenses, and the President of the United States exercises the same power in behalf of offenders against the laws of the General Government.

Instruction.—No systematic instruction, either secular or religious, is imparted to the prisoners as a whole, except during one hour on Sunday, when services are held in the chapel of the institution. A small library is provided for the men, and they use it freely, being encouraged to do so by their thoughtful and humane officers, who manifest the warmest interest in the welfare of their charge.

Sanitary condition.—Considering the location of the prison, its peculiar surroundings, and the many inconveniences to which it is compelled to submit, the health of the convicts is quite remarkable. This is no doubt accounted for by the extreme care of their officers in preserving the utmost cleanliness in every part of the buildings occupied. The food is of the best quality, carefully cooked, and regularly served, with an abundance for every man according to his necessities. The variety observed in providing the meals through the week is very judicious and well calculated to preserve a healthful tone in the digestive organs. Bathing is required as a regular duty, and everything that conduces to health is carefully regarded in the administration of the affairs of the prison. The Fourth of July, Thanksgiving day, and Christmas, are "legal holidays" in this institution. On these days the convicts are served with as good a dinner as any first-class hotel can provide. They are allowed the freedom of the prison. They visit each other in their cells, converse, sing, and enjoy a wholesome social reunion. Considering the serious lack of material aids and of the ordinary conveniences of such places, this prison is, in a generous sense, a model of wise,

humane, and efficient management. Time and a better appreciation of the true ends of penal discipline will do much, it is to be hoped, to mitigate the evils arising from the unfortunate circumstances of its location and earlier history.

The total cost of maintaining the prison, in 1872, was \$30,485; the earnings from convict labor were \$14,973; excess of expenditure over earnings, \$15,512; cost per prisoner, \$168.81.

II. *State Reform School*.—This institution was established and opened under State auspices, in January, 1863. It occupies sixty-three acres of ground about three miles from the business portion of Saint Paul, on the main road to Minneapolis. It is about seven miles from the latter city and is located on a commanding eminence overlooking a large extent of country, in an eminently healthful situation.

The total cost of buildings to the present time has been \$30,000; the total number of boys committed to the institution, 180; the total number of girls, 15. The sexes are entirely separated from each other. The annual current expenses are about \$20,000.

As far as possible the "family plan" has been adopted in the management of the institution. As only the main building has yet been erected, this plan cannot be fully carried out in practice. The inmates of the institution are brought under such influences as prevail in a well-governed and well-regulated home, with good instruction and a firm though kind and paternal discipline. The rewards and punishments are of the *natural kind* in use in all well-managed homes. The "lock-up" has never been used; all the professional appliances of prison discipline are scrupulously avoided.

The inmates are well fed, well clothed, well instructed, and well disciplined. They are allowed an abundance of play, and yet they are required to work systematically and to study attentively. In the words of the very efficient superintendent, Rev. J. G. Riheldaffer, "*school-room instruction is the first great work of the institution*. We do not hold these children for the present pecuniary advantage of the State, but for *compulsory education*, and for a preparation for the work of life." These are noble words, and they should form the key-note to the management of every reformatory and penal institution.

A large garden of fruits and vegetables is cultivated, and many of the boys are required to labor in it during the summer. A considerable number are employed in the domestic department of the institution. In addition to these employments, there is a tin-shop in which the boys in squads of twelve are learning the tinner's trade; a shoe-shop, with every facility for learning that trade; and a tailor's shop, in which they learn to make and repair their own clothing.

To these educational, domestic, and industrial means are superadded religious instruction in which our obligations to God and to our fellow-men, and our accountability to God together with the noble rewards which attend a life of virtue and the fearful penalties of a life of vice and crime, are held up as the incentives to a patient continuance in well-doing.

Considering the youth of this institution and of the State which fosters it, with the yet stunted means at its disposal, it is a decided success. The boys who have been discharged from it are for the most part conducting themselves in such a manner as fully to vindicate the wisdom of the means employed to save them from a life of crime, and make them honest, upright, worthy citizens.

III. *County jails*.—With very few exceptions these institutions in this State are of the most primitive sort and scarcely fit for the accom-

modation of the beasts of the field. This is an apparently inevitable consequence of the peculiar state of things existing in a new country, with a yet meager population, and with resources only partially developed.

In several of the larger cities—Saint Paul, Stillwater, Winona, Hastings, and Rochester—very creditable buildings have been erected for the uses of the jails in their respective counties. In many cases, however, the jail is but a meager appendage to a splendid court-house, a single room being supplied with cells for the confinement of persons accused of crime and awaiting trial.

At Winona, however, a large and commodious building has been erected for the exclusive occupancy of the county jail, the sheriff, and his under-officers. This building is of stone, is finely located, and is really a model of its kind. The cell-block is two stories in height, and the cells are entirely of wrought iron placed back to back in the center of the prison, and are surrounded by a spacious and airy corridor, paved with heavy boiler-iron. It is kept scrupulously neat in all respects, while escape from it seems a physical impossibility.

12. MISSISSIPPI.

By General B. B. Eggleston, president of the board of inspectors of the state prison.

The management of the state prison has, under the provisions of an act passed by the legislature entitled "An act for the regulation, control and support of the penitentiary," approved March 28, 1872, undergone a marked change for the better in almost every respect, and notably has this been the case in the treatment of the convicts. Hitherto these unfortunate outcasts have not received that care and attention for which humanitarians in this country and in Europe (whose efforts are now happily about to be crowned with success) have so long and persistently labored. Up to the 3d day of last May, when the present superintendent, Mr. C. W. Loomis, took charge of the prison, unnecessarily cruel punishments, which might justly be termed the relics of a barbarous age, still prevailed. But the people of our State have not been unmoved spectators of the universal movement in the direction of prison reform, and the public sentiment was significantly expressed by the legislature in the act above referred to, whereby corporal and every other species of punishment, not tending to enforce the rules and regulations necessary to prison government, were abolished. And this is better shown by reference to the thirteenth section of the act, which reads as follows:

That hereafter the head of no female convict shall be shorn, and no punishment by *blows* or *stripes* shall be inflicted, under any circumstances whatever, upon convicts of either sex; but it shall be the duty of the inspector to prescribe such punishment, in the form of solitary confinement in a dark cell, or such other mode as they may deem fit and expedient; and it shall be the duty of the superintendent to keep a merit and demerit roll of the conduct of the convicts, and he shall, from time to time, report the same to the governor, who shall shorten the term of service of any convict at the rate of three days for each month of said term, whenever said merit-roll shall indicate that said convict has been guilty of no violation of the rules of the penitentiary.

Under the above and other provisions of law, and in the exercise of a wise discretion, the superintendent has succeeded in transforming the convicts, who came under his supervision morose and discontented, into a remarkably orderly class of men.

They seem now to feel something of that self-respect which is so invaluable in law-abiding communities. Every encouragement consistent with prison regulations is afforded to develop the best qualities of their nature, and to cultivate in them moral principles which will hereafter tend to make them better and more useful citizens.

The superintendent has, as far as possible, caused them to feel that they are governing themselves, rather than being slavishly governed, and the result is apparent in the remarkable fact that, out of over four hundred convicts, he has found it necessary, under the present regulations, to punish only two.

Religious instruction is regularly administered to them, and they attend divine worship in their chapel every Sabbath with apparent willingness, and some show of devotion; they also attend a well-managed Sabbath-school, established for them within the prison; they have the advantage of literary recreation in the use of a library, maintained by a fee of 25 cents for admission of visitors to the institution; and once a year, on Christmas day, they are allowed the use of the prison hall, and free communication with one another.

The superintendent has also shown a very commendable zeal in another important direction, viz, in the distribution and apportionment of labor. Making himself thoroughly acquainted with the habits and dispositions of the convicts, he assigned to them that kind of labor to which, from their mental and physical capacities, they were best adapted; and in no case has an undue amount of labor been given to a man as a punishment, the superintendent humanely claiming the object of a criminal's incarceration to be a reformation of his character rather than a vindictive punishment of his crime.

By these means he has acquired an influence over the heads and hearts of these unfortunates, which has enabled him in his first annual report to the board of inspectors to exhibit a greater amount and better quality of work in every department of labor than has marked the close of any previous year. He has encouraged among them a spirit of emulation, and the result has been most satisfactory. To use his own words, "The most contented and cheerful prisoners we have are those who evince the greatest interest in their work, and endeavor to complete what they have to do in the most expeditious and workmanlike manner."

The above remarks apply only to prisoners within the walls of the penitentiary, and who are, consequently, under the immediate personal supervision of the superintendent. There is another class of prisoners referred to in his report as "prisoners working on railroads." Owing to want of accommodation for all the prisoners in the present building, it has been, for the past few years, found necessary, under the authority of law, to lease the labor of the surplus convicts without the prison walls.

They have been employed on plantations and in the construction of railroads. For their protection, the most jealous restrictions have been placed upon the lessees; nevertheless, the position of this particular class has been a source of much public uneasiness. The legislature, during its last session, though it inaugurated many wholesome reforms and abolished many objectionable features in the prison management, did not feel that it could make any changes for the better in this direction, except prospectively. It made provision for the purchase of a site for, and the construction of, a new building, which will, when completed, afford ample accommodation for all our convicts within its walls. The board of inspectors show a keen appreciation of this unsatisfactory

mode of employing convicts' labor, as will be seen by reference to their first annual report to the governor. The superintendent himself, in his report to the inspectors, in which he describes at length the condition of this class of convicts and their removal from the ameliorating influences which he is enabled to throw around those within the walls, thus gives expression to his very great anxiety on this subject :

But I submit that it is prejudicial to the best interests of the prisoners ; and that the very intent of the law itself is defeated when they are thus employed. The object in sending a prisoner to the penitentiary is, first, to prevent crime ; and, secondly, the reformation of the criminal. It is the imperative duty of those having prisoners in charge to labor to effect this reformation ; and it is a matter of impossibility to enforce the same discipline outside the prison walls which is enforced within.

No doubt these earnest appeals in behalf of this class of convicts will have their legitimate effect in inducing the legislature to hasten the work of completing the new prison building. It is believed that the legislature will, at the same time, testify its appreciation of the results of partial improvement by the adoption, at the earliest possible moment, of a thorough and complete system of prison reform.

13. MISSOURI.

[No formal report was received from this State, but the two delegates, Mr. Miller and General Miner, commissioned by the governor to represent Missouri in the Congress of Baltimore, learning this fact, handed in the following memorandum :]

Having heard from the corresponding secretary of the National Prison Association that he had received no report on the penal institutions of Missouri, we, who are delegates from that State to this congress, beg leave to submit the following on the present condition of such institutions, with the regret that it must, of necessity, be so meager and incomplete.

Missouri has only one penitentiary, which is located at Jefferson City. It now contains some nine hundred convicts, of whom about twenty-five are women. The inspectors are State officers, consisting of the auditor, treasurer, and attorney-general, who hold their position *ex-officio*.

Under the earnest recommendations of the governor and the board of guardians, we are confident that our penitentiary will be placed, by the legislature now in session, on a higher ground of reform to the convict and of usefulness to the State. This institution has been made, since its erection in 1836, the theater of experiments of almost every modern system of management. The State itself has undertaken the management of its labor as well as its discipline. It has been leased out for a term of years to a company, with full control given to them over the prisoners. At present the labor of the men is hired to various individuals and for varied industrial pursuits. Under all these modes of management, the institution has been a source of heavy expense to the State ; it has never been self-sustaining.

The system of management is the congregate, and every privilege is allowed to the inmates consistent with the public safety. The principle of kindness, as far as possible, is the present rule of action. The lash is abolished and the striped garments will be only retained, it is hoped, until some exterior walls now in process of construction shall be finished. The labor of the convicts is hired at 40 cents a day.

The education of the convicts is at present utterly neglected. Yet we

anticipate, among the coming improvements, a system of instruction that will provide for a teacher-in-chief, with the power of taking from the convicts a suitable number of competent assistants ; and that ample time will be given to impart to all illiterate convicts a fair common-school education.

From the experiments made, we are convinced that, for the class of convicts now in the Missouri penitentiary, the congregate system is by far the best. We cannot commend the adoption of any plan of management that, by a coercive system of silence and unceasing labor, for hours, on one branch of industry, in one position, and with downcast eye, tends to crush out the manhood of the convict, and which, by forcing his thoughts continually in the direction of his own sufferings, is calculated to breed feelings of revenge toward the State, and of hatred toward his keepers. Our observation and experience confirm us in the belief that the social nature of the prisoner should be exercised and developed under proper guidance, and that, so far from any evil resulting, this plan may be made a powerful element of individual reformation.

The system of county jails in our State is one that requires many changes. We except the new jail of Saint Louis, which, in all the elements of a good prison, has scarcely its superior in the United States.

The city of Saint Louis has a house of refuge and a work-house ; but the State itself has no reformatory institutions, no industrial schools, no houses of industry and correction. We earnestly hope and believe that the question of organizing these essential agencies in a system for the prevention and repression of crime will receive the early attention and favorable action of the legislature.

14. NEBRASKA.

By Rev. J. W. Snowden, Missionary A. S. S. Union, and acting chaplain of the State penitentiary.

The great aim here is to educate the head and heart, reform and elevate, making the prisoners feel that they can regain what they have lost, and be prepared, socially, morally, and religiously, to assume citizenship, and enter anew upon the honorable duties of free life.

The discipline, though firm, has been tempered with much mildness. The Bible has been publicly opened and studied, the word of God is preached every Sabbath. From the prison vaults songs of Zion ascend daily. Three nights in the week a common school is conducted with marked success, in which Indians, Africans, and whites are taught to read and write. Instructive lectures are, from time to time, delivered to the prisoners. A literary society has been formed and meets weekly. The convicts are also supplied with books, and with religious and literary papers. Of forty-eight prisoners discharged within the past eighteen months, only one was unable to read and write. Several have given unmistakable evidence that they have passed from death unto life, and their reformation is complete.

Mr. Henry C. Campbell, the present warden, is a humane and efficient officer. May God more abundantly bless the great work of reclaiming and reforming the fallen and guilty.

15. NEW HAMPSHIRE.

By Rev. Wm. Clark, D. D., formerly chairman of the joint legislative committee on prisons.

New Hampshire contains a population of 313,300 souls; an area of 9,280 square miles. Its inhabitants are mainly Americans by birth, and descendants of the Puritans. In late years the enlargement of manufacturing enterprises, and the development of our extensive water-power have brought in a considerable foreign element. In general education, morals, good order, obedience to law, and industry, the State will compare favorably with any of her sister States.

Our penal institutions are the state prison at Concord, and our ten county jails, one in each county.

Refractory prisoners are generally subdued and brought to obedience by kind, yet firm, moral treatment; where this fails, confinement in dark cells, with diminution of food, is generally effective. Prison inmates are men, notwithstanding their violation of law and incarceration; self-respect they have still, to which, if appeal be generously made, their dormant manhood will re-appear, and they often show themselves possessed of noble qualities. This is the kind of discipline which, in the main, characterizes the government of the New Hampshire state prison, and which, its officers testify, renders its management comparatively easy. The commutation law, which enables prisoners by good conduct to shorten their terms of imprisonment, has proved an effective agent of discipline and reformation.

One of the results of our system of universal education in New Hampshire is, that but a comparatively small number of the inmates of our state prison are unable, on committal, to read and write. Of the eighty prisoners confined April 30, 1872, seventy-two could read and write; six could read, but not write; two only could neither read nor write. The chaplain maintains a school for such notwithstanding the smallness of the number.

There is a good library belonging to the prison containing about fifteen hundred volumes, mostly valuable books, which are much read by the prisoners. The legislature appropriates \$100 per annum to keep up and increase the library.

The prison enjoys the constant labors of a faithful and experienced chaplain. At 9 a. m. on the Sabbath he preaches in the chapel of the prison building, when all the male prisoners are required to be present. At 10 he holds religious services with the female convicts, which are followed by a service in the hospital. At 1.30 p. m. a Sabbath-school is held in the female department. At 3.45 a similar service is conducted in the male division by prison officers, assisted by Christian gentlemen of different religious denominations, who volunteer their services for this work. The remainder of the Sabbath the chaplain devotes to private conversation with the prisoners in their cells. Attendance on the Sabbath-school is not compulsory; but more than half the prisoners attend voluntarily. A convicts' prayer-meeting is held every Wednesday evening, which is well attended by the prisoners, who take part in the exercises of prayer and singing, with propriety of demeanor, and with much apparent, and it may be hoped sincere, devotion. At any rate, its influence upon the tone of the conduct of the prisoners is indubitably and decidedly good.

The only industry carried on at present is that of the manufacture of cabinet-ware. The labor is let to a contractor at 95 cents a day per man. The annual profit exceeds the expenses. The expenditures for

the year ending April 30, 1872, were \$14,429.85; the earnings \$19,930.88; a net gain to the State of \$5,501.03.

The system is that of congregate, as distinguished from cellular, imprisonment.

Perfect silence is maintained among the prisoners while at work, and, indeed, at all other times; nor are they permitted to communicate by signs more than by words.

The prison is well ventilated and kept clean and wholesome. The cells and halls are swept daily, and often thoroughly washed. The clothing and bedding are comfortable. The food is ample, varied, well prepared, palatable, and nourishing, as the generally hale appearance of the prisoners clearly shows. The physician daily visits the prison, taking a kindly care of the sick and of chronic invalids. Mortality among prisoners is probably greater than among the same number of law-abiding persons, for the reason that many convicts enter prison with constitutions impaired by vice and crime. The deaths among the 1,522 inmates of the prison during the sixty years of its existence have been 102, or at the rate of $1\frac{1}{3}$ per year on the average.

On the whole, the government and management of our state prison, in its several departments, will compare, I think, favorably with most institutions of the kind in our country. The prison building might be improved; the dormitories are too small; and other architectural deficiencies are patent. But considering that the prison was erected two generations back, its arrangements and conveniences are quite tolerable. Its government is firm, but humane. The physical and moral welfare of its unfortunate inmates is kindly regarded and, to a good degree, promoted. The institution is creditable to the character of the State.

Our county jails are very far from being models. The jail system stands in need of radical reforms.

The reform school, established by the State some fifteen years ago, near the city of Manchester, was designed as a home and school for idle, vagrant, and vicious children. There was found to be a rapidly increasing number of children of both sexes in our manufacturing towns, especially the children of foreigners, who were growing up in idleness, immorality, vice, and crime, and who, unless checked and reformed, would become dangerous members of the community, and soon be candidates for the state prison. To save the children and train them to honest industry, the reform school was established, and it has, in some good degree, accomplished the hoped-for objects.

The inmates of the school make good, many of them rapid, improvement in the ordinary branches of common education; but their moral improvement is not so encouraging. This should not be cause of surprise, as most of them had previously lived under evil influences and formed vicious habits. Still, the larger part leave the school improved in character and become useful members of society.

A farm is connected with the school, on which all the boys work, more or less. In the winter they are employed to some extent in caning chair-seats. The girls are taught sewing, house-work, &c. The managers feel that there should be introduced into the establishment some of the usual trades, believing that such a measure would be for the best good of the inmates.

A great desideratum in the reform school is a chaplain, who would devote himself wholly to the moral and religious instruction and training of the scholars.

A society to aid discharged convicts was formed a few years since in

the State, but as yet is small in membership and means, and has not acquired a large influence, or accomplished very important results.

16. NEW JERSEY.

By John F. Hageman, Esq.

The State of New Jersey is giving increased attention to the science of penal law and prison reform. It has made more advance within the last ten years than in the preceding half century. It is, however, only a follower and not a leader in this noble cause, which is attracting the attention of civilized nations as the most inviting field of Christian philanthropy—the most important branch of social science. It is not that the people of New Jersey are less philanthropic and humane than their fellow-citizens of other States that they have given such a tardy support to this great movement; nor is it that they occupy a lower grade than others in education, religion, and public wealth.

The State claims now to be ranked among the foremost States of the Union in its system of public schools. In addition to this and its prosperous normal school, it is distinguished for its several colleges and seminaries, literary, scientific, and theological, of world-wide fame and influence, and for its large number of Christian churches and charitable institutions, all creating an enlightened and Christian public sentiment throughout the State. And no State is in a better financial condition and better able to respond to the calls of reform measures than New Jersey.

If our people have been apathetic, and have lagged behind in this reform movement, it may have been due, in some measure, to their strong confidence in the unsullied character of the judiciary of the State, to which they have intrusted the enforcement of its penal laws for the repression of crime. With no corrupt connivance between the courts and criminals, they have been assured that the machinery of their legal tribunals are in the hands of pure, honest, and learned officials. It may be that with such confidence in the bench and bar of the State, for the due punishment of crime, they may have become too indifferent to that feature of punishment which relates to the reformation of the convict, as well as toward juvenile reformatories for the prevention of crime.

But the philanthropic heart and conscience of New Jersey have been touched by the appeals and labors of prison-discipline associations of other States, and it is hoped that henceforth vigorous and co-operative efforts will be made to win the prisoner back to virtue, which is not a hopeless work. The late Dr. Benjamin Rush of Philadelphia, before the Society for Promoting Political Inquiries, convened at the house of Benjamin Franklin, in 1787, in speaking of the effects of public punishment, said: "I have no more doubt of every crime having its cure in moral and physical influence than I have of the efficacy of the Peruvian bark in curing the intermittent fever. The only difficulty is to find out the proper remedy or remedies for particular vices."

The public institutions of the State which are strictly penal are: 1. The state prison; 2. The county jail. And those which are chiefly reformatory and preventive are: 3. The State Reform School for Juvenile Offenders; 4. The State Industrial School for Girls.

I.—*The state prison.*

This is situated near the Delaware, in South Trenton. It was built in 1836, in place of the old Lamberton prison. It was designed to carry out the solitary system, which was then approved, but which has been since abandoned as injurious to health and mind, expensive and ill-adapted to the reformation of the prisoners. The building has been enlarged from time to time by additional wings, one of which, known as the east wing, has just been completed, with 170 cells, constructed and finished upon modern, reformatory principles, as to light, ventilation, cleanliness, and security. The whole number of cells in the prison is 522; all are lighted with gas at night, as are also the public rooms and halls. The whole building is warmed by steam, and under its present careful management it is not subject to the charge of being utterly unfit for a prison, but it really contains all the elements of a suitable building for such purpose. The average number of prisoners during the past year was 527.

General administration.—By recent legislation the government of the prison has been improved. In 1869 the prison act was revised and amended, and the office of supervisor was created, the appointment to be made by the governor, chancellor, chief justice, and attorney-general of the State, for the term of three years, with a salary of \$4,000 a year. This officer, and the comptroller and treasurer of the State, constitute a board of supervisors. The keeper and the five inspectors are chosen annually by the legislature; the constitution requires this; the keeper receives a salary of \$4,000, and appoints his deputies. The judges of the supreme court and court of errors, and the members of the legislature, constitute a board of visitors. The annual election of the keeper and inspectors by the legislature destroys the stability of the prison administration. Politics will, in this way, interfere with the appointment, and frequent and uncertain changes in the offices of keeper and inspectors are hurtful to the good management of the institution. There is no central power supervising and directing the entire penal system of the State. Such a power, having charge of all the penal and reformatory institutions of the Commonwealth, with a new classification of crimes and the establishment of intermediate prisons, would be of great utility.

Prison industries.—The present law requires every convict to be kept at hard labor every day except Sundays, if able to work. The original plan of private labor in cells has been superseded by ample workshops, erected in connection with the prison, where the prisoners work together in silence, and take their meals at a common table, also in silence, having teachers and overseers in their work. Their labor is done by contract, which is not favorable to the labors of the moral instructor. But the system works well financially thus far. The convicts are happier and more obedient, under such a system of labor, than the former one, and their earnings amount to more than enough to maintain them in prison. The State has received this year about \$28,000 from the surplus of their earnings after taking out the cost of their maintenance. Their earnings the past year amounted to \$80,892.99, and their expenses were \$52,414.52, exclusive of the salaries of officers. It may soon become wholly self-sustaining.

Discipline.—The treatment of prisoners has become kind and humane. No corporeal punishment is allowed by law. The use of the parti-colored dress is retained to prevent the escape of prisoners from the workshops, which are not yet as secure as they should be. The order among

the prisoners is improved by the system of work and the reformatory efforts bearing upon them. Kind treatment is not lost upon them.

Religious and secular instruction.—This is an important department of duty. As far back as 1827, in the old Lamberton prison, the students of the Princeton Theological Seminary, under the inspiration of the Boston Prison Discipline Society, visited that prison every Sunday to teach the Bible and to preach to the prisoners, and the legislature favored it and directed rooms to be provided in the prison for that purpose. The law has, for a great many years, authorized a supply of the Bible and other books to the prisoners, and also a suitable person to give them religious instruction. The moral instructor is now appointed by the governor and supervisors, with a salary of \$1,000 a year, and he is required to devote all his time to his office. He preaches every Sabbath in each of the four halls of the prison and recites the Moral Law, the Apostolic Creed, and the Lord's Prayer. The Bible and religious papers and books are distributed among the convicts, and are gladly received and read by many of them.

The moral instructor and the other officers of the prison concur in an appeal for a chapel for religious services on Sundays. At present the prisoners are in their cells unseen, while the preaching is done in the hall in their hearing. It is urged, we think with good reason, that the prisoners should all be allowed to meet together, in a chapel where they could see the preacher, and he see them, eye to eye; where they could sing together, and feel all the glow which social public worship excites. What a congregation five hundred prisoners would make! How an earnest and eloquent minister would be quickened by such an inspiring company of hearers! What marvelous conversions might be expected among such a class of men, many of whom have broken and sorrowful hearts! Such preaching is the divinely-prescribed means of reforming and regenerating men, and no men are more in need of such means than prisoners, for whom the gospel was designed and sent.

The legislature has appropriated \$10,000 for the erection of a chapel, and it may be hoped that this great desideratum will soon be supplied.

There ought to be a person employed as a secular teacher, especially for those prisoners who cannot read and write. At present there is no provision for secular instruction in the prison. This we hope will soon be provided. The hours of labor need not be encroached upon, for this instruction could be given in the evening.

The library.—The prison library now numbers 2,500 volumes, which are read with interest by the prisoners. It exerts a good influence in the prison.

Commutation and rewards.—The principle of remitting a part of the term of the sentence for good conduct, so universally commended by experienced prison keepers, has been adopted in a small degree in New Jersey. The moral instructor, supervisor, and keeper, all testify to its happy influence on the order and good behavior of the prisoners. The number of those who received a remission during the last year was 215.

The giving *rewards*, by allowing the prisoner to retain a portion of his earnings for his own use when discharged, or for the use of his family, has not yet been adopted in this prison. The legislature will probably authorize it when they next amend the prison law.

Pardons.—This power could not be lodged in safer hands than in the court of pardons, which is composed of the governor, chancellor, and the six lay judges of the court of errors, or a majority of them. The number pardoned last year was 63. It is usual to extend a pardon to a certain class of prisoners, a little before their term expires, so as to save

their citizenship, since a pardon operates as a rehabilitation of the prisoner in his civil rights.

Discharged prisoners.—We have no adequate provision by law for aiding prisoners upon their discharge. The statute allows \$5 to be paid to each convict when discharged; and the lack of State aid is not supplied by voluntary charitable associations. The same motives which would prompt efforts to reform convicts in prison ought to prompt efforts to save them when they go out from relapsing into a criminal life. This subject is receiving special attention, which will result probably in the organization of an aid association, and of additional legislation, perhaps a State commission to take charge of the matter.

Reformation of prisoners.—The principle which underlies all these prison-reform measures rests upon the conviction that punishment, whose chief end is to prevent crime, is effected not merely by depriving the offender of the power to repeat his offense, nor by intimidating others from the commission of a like offense, but by reforming the character of the prisoner (where he has not forfeited his life) and restoring him to society a better man. Superadded to these ideas of punishment is that one of preventing crime by training wayward and neglected children from the paths of vice into those of virtue. Hence our reform schools. New Jersey is making progress in this direction. It is not possible to determine how many prisoners have been reformed, nor to what extent they have been benefited by the efforts made for that purpose, for we have only just begun to make our prison a place where human beings might be improved in character. But we have certain knowledge that much good has been accomplished, and we have faith that in the future much more efficiency will attend the reformatory efforts. The number of recidivists must grow less and less.

II.—County jails.

There are twenty-one counties in the State, and a jail in every county, and in a few instances a workhouse connected with the jail. These county prisons are for punishment as well as for detention. As a general thing, they are insecure, filthy, unhealthy, and utterly destitute of reformatory power. There is no system of discipline by which they are governed. The care of them is rather incidentally committed to the sheriff; but he is under the direction of the chosen freeholders, who are elected more with reference to the building of bridges, &c., than to their qualifications to discipline prisoners and regulate prisons. In structure and government, with perhaps one or two exceptions, they are all a miserable failure. The number of convicts confined in them is too small to justify the expenditure of money necessary to maintain reformatory provisions.

Within a few years past, a sentiment in favor of attaching a workhouse to the jails has resulted in the experiment in three or four counties, but such a policy is not fully vindicated by the trial, especially in the rural counties. The number of prisoners is too few and fluctuating to warrant the outlay involved in conducting a system of prison labor. The character of our jails is such that our courts feel constrained to send too many convicts, guilty of trivial misdemeanors only, to the state prison. There is really no classification of prisoners in the prison system of the State. The jail prison laws need thorough revision. A county jail should be fitted and used only for the detention of persons awaiting trial. If several counties could unite in sustaining a penal prison, to be made reformatory by work and other proper appliances to

that end, it would be an improvement upon the present plan; or if a system of intermediate prisons by the State could be adopted, these penal jails might be dispensed with. We are glad to believe that the present system cannot much longer withstand public opinion.

III.—*The State Reform School for juvenile offenders.*

In 1850 an act establishing a house of refuge was passed, and a building was commenced on a beautiful site at Kingston, but through the freaks of party politics the act was repealed and the work abandoned, the State treasury paying for the loss and damage. Fifteen years were lost to the cause of this reform. But the blunder has been corrected by the act of 1865, which established the State reform school for juvenile offenders. This institution has been organized on a farm of 490 acres near Jamesburgh, in Middlesex County, a central and eligible situation. Suitable buildings have been erected, to carry out the plan of an open farm system, for the reformation of boys between eight and sixteen years of age, who shall have committed some crime other than murder or manslaughter, or shall be habitually disorderly, vagrant, or incorrigible, or otherwise fit subjects for such an institution. Its object is to prevent rather than to punish crime. The boys are taught to work on the farm, and are instructed in secular and religious learning. The number of boys now in the institution is about 140. All the appliances for reformation are employed in this school. It is well governed. The board of control consists of the governor, chancellor, and chief justice of the State, by whom six trustees are appointed, and they exercise a supervision. The approval of a justice of the supreme court is required in every case of committing a boy to the school. It is not a prison governed by physical force, but "the Christian idea of a well-regulated family, with the steady pressure of kind, moral, and social influence governing all its discipline." The family system, in contradistinction to the congregate, is the one here employed. The boys show their appreciation of it by not running away, even when unrestrained. A new family building has just been erected near the main building. There have been 300 boys in the institution since 1867.

It is a success, and a great preventive of crime in the State. It is well managed and liberally supported by the State.

IV.—*The State Industrial School for girls.*

This school has been in operation for a year. It is held in a rented house at Pine Grove, on the Delaware, a little below Trenton. The site and appropriate buildings, though authorized by the legislature, have not yet been procured. There are seventeen young girls in the school, who are employed in making their own clothing, and in helping to make clothes for the boys' reform school. The same provisions which control the admission of boys in the reform school, and the same supervision and control which the governor and other officers exercise in governing the reform school, are applied in this institution for girls. The justices of the supreme court in their circular say:

The institution is not a home for merely destitute or orphan children, but is the offspring of a growing conviction that young females who have violated the law should have some other refuge assigned them than our vile common jails, where there are not only no barriers to constant contact with every class of criminals, but an entire absence of all appliances of a reformatory character.

There are six lady managers appointed, besides the trustees, to supervise and manage the institution.

V.—*Private preventive institutions.*

There are private orphan asylums, children's homes, &c., in the State, which are not state institutions, but are sustained by churches, or private charity, some incorporated and some not, which are germane to those preventive schools of the State above mentioned, in training destitute and neglected children. But we deem it unnecessary to incumber our paper with further details.

General conclusions.

1. The penal laws need revising. The number of *mala prohibita* offenses have been so multiplied that many persons are indicted, convicted, and sent to the state prisons, where they fare precisely as the manslayer and highway robber do, for offenses which are trivial, hardly to be called criminal. There are too many men sent to the state prison.

2. There should be *intermediate prison houses of correction* for those who are convicted only of misdemeanors, and for those who have been in a measure reformed in the state prison, to whom more privileges can be safely accorded of a reformatory character than a state prison can allow. This would, at the same time, greatly relieve the state prison.

3. A classification of crimes, punishments, and prisons should be made by law, and the whole system of jails and prisons in the State should be administered by some central unit power, withdrawing from county jails their penal character, and making them only places of detention, with their structure and government thoroughly changed.

4. Larger rewards should be given to prisoners from their earnings, for good behavior; and more aid should be rendered to the discharged convict either by the State, or, what is better, perhaps, by associated private charity, with state aid.

Toward this high standard New Jersey is gradually progressing.

17. NEW YORK.

By Elisha Harris, M. D., corresponding secretary of the Prison Association of New York.

The penal and reformatory institutions of the State of New York are reported upon by the author of this paper from the stand-point of recent searching personal examination and nearly two years of study and official intercourse with them. If the view presented in the report is not flattering to our State pride, the facts are certainly adapted to awaken inquiry and incite to the efforts needed for the improvement of these institutions and the increased efficiency of the penal and reformatory work to be done by them.

The State of New York has a much greater burden of criminal population than the well-ordered and law-abiding classes of society are aware of. We have three state prisons; six local prisons, under county administration, named penitentiaries; sixty-seven county-jails in our sixty counties; and something more than one hundred police stations, or lock-ups, in the various cities and large towns of the State. Most of the institutions embraced in these several classes suffer from over-crowding, including many even of the county jails, which last are, for the most part, in a condition not to be commended. The number of prisoners confined in the police prisons, where the detention is often only for a

few hours, and never for more than a few days, is not known to the writer. The population of the other prisons named above, in the autumn of 1872, was as follows: State prisons, 2,924; penitentiaries, 2,435; county jails, 1,600; making an aggregate of 6,959. The number of children and youths confined in the five reformatories, viz, the two houses of refuge, the asylum for juvenile delinquents, and the Catholic protectories, (male and female,) was 4,000. This gives a total number of persons under restraint and in custody for violations of law, not including those in police jails, of 10,959.

The total annual number of convictions for felonies by courts of record is less than 2,500, and by lower courts, ranking as courts of sessions, the number is about 80,000.

The law which allows a prisoner to shorten his term of sentence by good conduct and industry is the most effective instrument of discipline at present known to our prison administration. The dark cell, reduced diet, perforated paddle, and all other forms of punishment in use, bear no comparison in their deterring influence and moral power to that of the fear of losing the small gain of time in their sentence allowed by the commutation law.

A perfect understanding now exists between the board of inspectors of the state prisons and the New York Prison Association as to their mutual relations and the rights of the association as regards admission into the prisons and the use of agencies for the salvation of the convicts after their liberation. In each of the three state prisons the corresponding secretary is provided with an office, where he is permitted to send for and converse with any and all prisoners whom he may desire to see, and to counsel and aid with reference particularly to employment after their discharge. The prison wardens, chaplains, and clerks have been officially instructed by the board to give all the information and aid desired by the association for the furtherance of this end, so that it may be enabled to render all the service possible, both to the convicts on their release and to the interests of society and humanity, on whose behalf the service is performed. Lists of the prisoners to be discharged each month are sent to the association in advance, and the secretary visits regularly all the prisons, and has an interview with every such prisoner, to ascertain his physical condition, ability, wishes, purposes, and whatever else may be helpful to him in enabling him to procure work the instant he becomes a free man, if his intention is to pursue an honest way of life. The key to the success that has followed this effort is the employment register, which contains classified lists of more than three hundred employers in thirty different occupations and trades of the best-organized industries all over the State. The private interviews with each convict during the few weeks immediately preceding liberation constitute the first essential step in the whole effort. Great pains are taken in these interviews to reach the convict's judgment, conscience, and heart, and to give him definite instruction and advice concerning common duties and the personal safeguards and care which he will most need when liberated. Care is taken also, on the other hand, to secure in each chosen employer a true and earnest co-worker in the effort to save these men, who are struggling toward a return to honest industry and respectability. As no intermediate stage of testing or preparation is possible, under existing circumstances, in dealing with convicts discharged from the New York prisons, and as it is all-important that they be usefully employed from the day of liberation, and that, as far as possible, they be dissuaded from going into the large cities, except under rare circumstances and definite stipulations

concerning suitable and constant employment, it is not too much to say concerning the helpful interest and efforts of the employers who have lent us their aid in this work, that theirs is the noblest share in it. Modify and improve the present method of this duty as we may, and, indeed, as events and progress in it must require, still the employer who continues to offer to the liberated convict the means for honorable and self-supporting industry and a replacement in the ranks of honest citizenship, will continue to be a chief dependence in all this difficult task.

Each state prison and most of the penitentiaries and larger jails make monthly returns to the New York Prison Association, showing the date of report; the name, nativity, age, and crime of the prisoner; from what county and by what court sentenced; term of sentence; reduction of sentence by good conduct; former habits and occupation; his employment in prison; his social relations and residence of nearest friends; present physical condition as regards ability to labor; amount of money ready for him on liberation; together with such general remarks as the authorities may see fit to append. A card is given to each liberated prisoner, on his entering upon the situation provided for him, containing sundry counsels, of which the following may serve as a specimen: Form the habit of depositing in a savings bank from 25 to 75 per cent. of your wages every pay-day. Keep clear of all bad associates. Maintain a habit of useful reading; with other like maxims. It is expected by the association and the employer that the person thus aided will promise, 1, to live prudently and honorably; 2, to labor faithfully and punctually; 3, to abstain from intoxicating drinks; 4, to maintain self-respect; 5, to deserve the respect of others; 6, to agree with his employer concerning the proportion of monthly or weekly savings.

The Houses of Refuge, the Asylum for Juvenile Delinquents, the Catholic Protectories, the House of the Good Shepherd, the Children's Aid Society, the Truant Homes, and other like agencies, in the metropolis and other large towns, are continually snatching multitudes of children and youth from destruction as "brands from the burning." They are adding at least 10,000 good, useful, and happy lives every year to the population of the country, while subtracting the same number from the crowded ranks of the vicious and the criminal.

18. NORTH CAROLINA.

By Rev. G. William Welker, former member of the board of directors.

The object that the National Prison Association sets before itself, in seeking reports from the several States, it may safely be assumed, is not merely to learn the number, character, and adequacy of their penal, reformatory, and preventive institutions, nor what may already have been accomplished in the direction of the work undertaken by the association, but also to seek data from which to learn what is yet to be done, to discover what hinderances are in the way of this work, and the peculiar condition or character of their populations that have a bearing on the question, if any such exist. It is proposed, in this report, to offer such facts, in regard to our State, as may present the nature and condition of the field for penal discipline and reformatory effort as it now exists; to present explanations that may account, partially at least, for the inadequacy of institutions for the prevention of crime and the little

interest felt in the welfare of our criminal population; and to indicate the difficulties to be encountered in the prosecution of the great work of the reformation of prison discipline and in the efforts to prevent the formation of a criminal class.

There needs, perhaps, a glance at the topography of the State to enable the reader to comprehend some facts to be stated in this report. One of the original thirteen States, the territory of North Carolina began to be settled at an early date. Its area is 50,704 square miles, which is more than that of New York; and yet the population is only 1,071,361. Of this population 678,470 are white and 391,650 colored. Of the entire population only 3,029 are of foreign birth. The territorial extent and homogeneity of population will have a bearing on the statistics of crime in this State and on the character of its penal institutions. North Carolina never has become a refuge for the vicious populations of other States and countries. Its reputation for obedience to law and its freedom from crime, before the rebellion, were known to the whole country. Commerce has never much flourished in this State. Its coast, though extended, bars ingress to its rivers by shifting sand-bars and maddened storms, which seem to keep guard against the outside world. There are no large cities into which the shipping of the world, in bringing its products, brings also its crimes. Wilmington, the largest city in the State, has a population that does not exceed 15,000, while no other reaches 10,000.

North Carolina was a slave State until 1865; manufactures were never encouraged; and hence its streams are not lined with manufacturing villages that give employment in their mills to a floating population, in which are commonly found those who swell the calendar of crime. A very large proportion of the million of its population is and has ever been engaged in planting and farming. While the farms were valued at \$143,301,065, the capital invested in manufactures and trades was only \$9,693,703. So the population is largely rural, and thinly scattered over a wide domain, having no populous and wealthy centers. In such population capital crime is unusual. Vagrants are not tolerated, and hence soil is wanting for the vicious classes. This may account, in part, for the fact that the attention of the State was not at an earlier day directed to the question of penal discipline.

That a State should grow as old as North Carolina, and yet have done so little in the way of preventing crime and reforming its vicious classes, may be owing to the fact that general intelligence has not been diffused among the people; that public schools are not appreciated, and that those who will not voluntarily tax themselves to organize schools and build school-houses for their own children, would naturally refuse to submit to taxation for the creation of institutions to prevent crime or reform criminals. The legislature of the State is mostly controlled by the tax-payers; their influence is seen in the practical denial of the axiom that "an ounce of prevention is worth a pound of cure." Although the constitution of the State, formed in 1868 by men of liberal and progressive views, provided for the creation of a board of "public charities," yet to this hour the general assembly, under its narrow and obsolete views, has denied that board all means for its work, even to the publishing of its annual reports. While the constitution provides for the erection of juvenile asylums, reformatories, &c., nothing has been done in this direction, and the fear of taxation paralyzes every effort at saving the large number of youths that are left to criminal associations. The recent political and social revolution has created a necessity of this kind, which is not felt as its pressing character demands. A pop-

ulation now requires the care of the State which, under the *régime* of slavery, rarely had its misdeeds brought to the notice of the courts. The slave being a chattel, most of his petty crimes were punished by the master, the patrol, or by a magistrate having summary jurisdiction. This state of affairs kept a large part of the crimes against society, not of the most serious character, from public view and knowledge, and relieved the State from direct concern. Slaves of every age being property, and, by the law, the owners being, in some degree, made liable for their conduct, the former could not conveniently be made objects of such legislative care as would express itself in reformatories and work-houses, where criminal propensity could be cured, and progress in crime arrested. These facts should be allowed their just force when we come to learn the position of the State in making provision for her existing criminal population.

The constitution of the courts, the forms of legal procedure, and the penalties against crime were, in their main features, down to the era of emancipation, those of the colonial days of the State; and the progress in criminal jurisprudence made by other States had hardly left its impress upon our statutes or our courts. In all the statutory laws of many years is seen and felt the presence of slavery. No care was had for the prevention of crime but such as grew out of the deterrent power of severe punishments. While the law visited condign punishment on all convicted offenders, there was no wise or kind forethought in its provisions by which to prevent or reclaim any class of citizens from becoming or continuing criminals. Every person convicted of a felony was looked upon as degraded beyond the regard or sympathy of society. He was subjected to the tortures of the whipping-post, the branding-iron, or, still worse, the loathsome companionship of the county prisons. It never came into mind that the lowly, the unfortunate, or the fallen still retained sensibilities which could be outraged, or that they were worth an effort of the State to reform and save them. Deep-rooted prejudice still holds the public mind to barbarous modes of punishment and counts offenders as outcasts, hopelessly lost to all the claims of humanity and religion. When in 1848 the question was submitted to the vote of the electors of the State, "penitentiary" or "*no* penitentiary," it was voted "No" with a perfect frenzy, not a single county, probably, voting in favor of such an institution. So until the revolution of 1861-'65, the only place of confinement for the convicted and those awaiting trial was the county jail.

There is a jail in each of the ninety or more counties of the State. Among all these prisons there is not one that would be a proper place in which to confine a human being under any circumstances. In their structure no regard is had for proper ventilation. Many of them have no means of being warmed even in the coldest season. Very often there is found in them a most offensive uncleanness. In these loathsome places all whose misfortune or crime makes them liable to imprisonment are huddled together, young and old, the guilty and the innocent, the hardened criminal and the youth arrested for his first offense. Here they are kept without work, without instruction, without occupation of any kind, except to recite and listen to recitals of robbery and crime. Thus the jail becomes a school of crime, in which its inmates are prepared for a life of resistance to the laws of God and man.

The framers of the constitution adopted by the people of North Carolina in 1868 made provision for the future of this State as regards reformatory and penal institutions. Had the intentions of that body been realized, the State would now have a secure and comfortable state

prison. The site selected is on a fine and healthy elevation, west of the city of Raleigh, on the line of the North Carolina Railroad, with a side-track running into the prison yard. At present only the foundation of the prison has been completed, its further progress being hindered by partisan legislation. The convicts are confined in temporary wooden huts, and are mainly employed in grading the grounds, in quarrying stone, and in building the exterior wall surrounding the prison yard.

The number confined in the penitentiary during the year ending November 1, 1872, was 493. Of these, 102 were whites and 391 colored; 352 could neither read nor write; 335 were natives of the State; 4 only were foreigners; and 112 were under twenty years of age. Nearly three-fourths of the convictions were for larceny, and almost all for crimes against property.

Of the 493 convicts, 33 died during the year, one in every 15, or nearly 7 per cent. This is a fearful mortality. The cell-huts are overcrowded; they cannot be ventilated; and they cannot be heated in the coldest weather. There may be other causes, but no State can be justified in such waste of human life by refusing to provide well ventilated and comfortable cells with wholesome food and plenty of it.

The penitentiary is managed by a board of five directors, appointed by the legislature, who name the warden, steward, and other officers.

The rules, originally adopted by those whose duty it was made to organize it, forbid all harsh and degrading treatment. The treatment was intended to be such as to win to a better life by kindness. Respect was had to the manhood of the prisoner, who was to be treated as one who might create for himself an honorable future. How far the philanthropic spirit of these regulations is carried out at present, the writer has no means of knowing.

In the existing condition of the prison building it is not possible to classify the convicts. No effort is made to keep them separate for any moral or reformatory end. Youthful transgressors, unused to the dark ways of crime, are put into a hut-cell with hardened villains who have reached the utmost bound of human wickedness. The boy of eighteen who took a piece of bread to satisfy hunger, or in a momentary passion committed an assault upon a fellow, is placed under the immediate training of those who are guilty of murder and robbery, finished adepts in crime. So, too, the prisoner who is repentant and tries to amend his life, who is industrious, obedient, and docile, is put in daily contact with the obstinate and ungovernable, who plot escapes and plan schemes of mischief. While the State provides no instructors in letters or morality, it nevertheless has teaching done, and sustains a school for crime, in which graduated villains teach the uninitiated all its secrets.

No provision, as just intimated, is made for scholastic or religious instruction. The great mass of ignorance has not a ray of light to pierce and enlighten its darkness during all the years of incarceration. From the statement previously made in regard to the illiteracy of the convicts, it clearly appears how much ignorance has had to do with sending them to state prison, and how much it is both the duty and interest of the State, while these neglected creatures are its wards, to educate them at least so as to fit them for common business life. A neat and comfortable chapel has been erected, but there is no chaplain, no Bible-class, no Sunday-school. An occasional sermon is preached to the prisoners, as some clergyman may be had to do it; that is all.

It is a sad lot, indeed, for youths, and those new to crime, that they should not be brought under the teachings of the Christian religion. It is matter of astonishment that, while the State fails in this

work, it is not taken up by the private effort of the Christian people and churches of the city of Raleigh. Here is work for a "Young Men's Christian Association" that will, in some measure, make amends for the neglect of a Christian State.

No abbreviation of sentence is allowed under the laws of the State. Good behavior or proof of reformation goes for nothing. There is no difference between being an obedient, docile, and industrious convict and an obdurate and obstinate one; both go forth free when their whole term of sentence is completed, and not till then. Even in a penitentiary there should be some recognition of right-doing, and such convicts as demean themselves well should redeem time from the term of their sentence. A measure of this kind is no novelty. It has become an element in prison discipline of many of our States and not a few foreign countries, and everywhere its good results have made themselves abundantly manifest. No provision is made either by the State or by private charity to aid and encourage, on their discharge, such prisoners as show some disposition to change their course and lead an honest life.

It was the purpose of the legislature which made the original appointment of directors, to relieve the penitentiary of all partisan character in its management, but events overruled their purpose, and now, as in most institutions belonging to the State, not only the directors but all the subordinate officials are appointed in view of their partisan relations. It is to be hoped that time will teach a better way.

There are no reformatory or preventive institutions in the State. The constitution makes provision for their creation, but so far it has remained a dead-letter.

19. OREGON.

No formal report was received from this State, but in a private letter received by the secretary of the National Prison Association from the Rev. Dr. Atkinson, he states that, as regards prison reform, things are moving on hopefully there. He says that new and greatly improved prison constructions for the State penitentiary are in progress, with ample grounds; that the system of scholastic, moral, and religious education has been much enlarged and placed on a better footing; that the prison dietary is excellent; that whipping has been abolished, and more humane and rational disciplinary treatment has been substituted, not only without loss, but rather gain, to the good order and obedience of the prisoners; that a kindly and hopeful feeling as regards the reformation of the prisoners begins to be entertained quite extensively by the people of the State; that, upon the whole, the state prison of Oregon may be said to be in a good condition, and to be doing well; that the chief city of the State last year completed a fine police courtroom and prison, in which the rooms are well lighted and ventilated, and every way comfortable; that the county jail in the same place is in the basement of the court-house, and consequently rather damp, but that effort is making to improve the ventilation, and make it at once safe for health and more comfortable for its inmates; that a law has been enacted to establish a reform school for boys and girls, and trustees appointed to carry it into effect; and that the abundant efforts of late put forth in this and other countries, through congresses, public meetings, the pulpit, and the press, in the great work of prison reform,

have borne their legitimate fruit in Oregon, in awakening in the good people of that State, thought, interest, and exertion.

20. RHODE ISLAND.

By Rev. Augustus Woodbury, chairman of inspectors of Rhode Island state prison.

The State of Rhode Island is divided into five counties, and in 1870 had a population of 217,353.

The penal and reformatory institutions of the State consist of the town bridewells, the city station houses, the county jails, the state prison, the Providence reform school, and the state farm. The bridewells and station houses are under the care of their respective municipal governments. The county jails, with the exception of the jail for Providence county, are in the charge of the sheriffs of the counties, who are elected annually by the general assembly. The state prison and the Providence county jail, together with the house of correction, all within the same inclosure and beneath one roof, are administered by a board of seven inspectors appointed annually by the governor. The Providence reform school is under the direction of a board of trustees, six in number, elected annually by the city council, to whom is added the mayor *ex-officio*. The management of the state farm is placed in the hands of the board of State charities and corrections, consisting of six members, appointed by the governor, with a term of service for six years, one of the board retiring every year. The board elect a secretary, who thus becomes a member *ex-officio*. In addition to the several boards of management there is a visiting board of ladies, whose duty it is to visit and inspect all places where females are imprisoned. All these boards make annual reports to the general assembly, with the exception of the trustees of the Providence reform school, who report to the city council.

The county jails.

The county jails outside of Providence are inspected by the justices of the supreme court at the commencement of each term. The jails are reported to be at present in good condition and secure. The number of commitments, except in Providence, is very small. During the past year there have been only 192 persons committed. On the 31st of December, 1872, there were in jail 9 prisoners in the whole State. In Providence county there have been 1,749 commitments during the year, 169 of whom were women; and on the 31st of December there were 113 prisoners, 104 males and 9 females, in jail; average number, $99\frac{43}{366}$. By the statute all prisoners punishable by fine of not less than \$5, or a term of imprisonment of not less than thirty days, are to be sentenced to the Providence county jail.

The state prison.

In the year 1797 the general assembly ordered the erection of a state prison, in connection with a new jail for the county of Providence, but in the following year the order was rescinded, and it was not until 1835 that measures were adopted looking to the project of building a prison for the State's convicts. The general assembly, in January of

that year, referred the matter to the freemen of the State, to be decided by a popular vote. In April the vote was taken, resulting in 4,433 votes in favor of building the prison, and 502 against it. The general assembly, upon ascertaining the will of the people, and after examining the merits of the Pennsylvania and Auburn systems, gave the preference to the former, and directed that a prison should be built accordingly. The building was completed in 1838, and in November of that year was opened, with three convicts as the total number of its inmates. Before the end of the month two more were added. At the expiration of the first year of the prison, September 30, 1839, the number had increased to ten. On the 30th of September, 1840, there were sixteen convicts in prison, fifteen males and one female. At this time the population of the State was 108,830.

Four years' trial of the Pennsylvania system convinced the inspectors and the immediate officers of the prison that the mode of separate confinement with labor was harmful in its effects. Workshops were erected in 1843. At a later period the necessity of a new and better constructed prison became evident, and in 1852 a new building, containing eighty-eight cells, was erected, at a cost of \$17,632 37. This was constructed as an addition or wing to the former prison, which was thenceforward used as a jail for the county. The constantly increasing number of jail prisoners compelled a larger provision for their accommodation, and in 1855-'56 another wing was added to the prison, containing seventy-two cells and two hospitals; a new wall was built and a new workshop erected, at a cost of \$47,143 37. One-half of this wing was used for the imprisonment of female convicts. Ten years later the county jail was relieved of most of its female inmates, and at present a single corridor of cells, entirely separated by heavy flooring and partitions from the remainder of the building, suffices for the restraint of female prisoners. On the 31st of December, 1872, there were in the state prison two and in the jail nine females. In the state prison there were at the same date seventy-one convicts; in the jail one hundred and thirteen prisoners. For the internal administration of the prison and jail there are required a warden, deputy warden, and eight assistant male officers, and a matron, chaplain, and physician. The warden, chaplain, and physician are appointed by the inspectors. The other officers are appointed by the warden, subject to the approval of the inspectors. In the internal administration of the prison a system of classification has been adopted by which the prisoners have been divided into five grades: 1. Excellent; 2. good; 3. tolerably good; 4. unsatisfactory; 5. bad. In 1872 the following results appeared: First grade, 33; second, 10; third, 10; fourth, 34; fifth, 4. The schedule is prepared monthly and submitted to the inspectors at every monthly meeting of the board. The inspectors, to whom the entire control of the state prison is committed, have full power and authority, according to the statute, to enlarge the confinement of the convicts and regulate their labor and exercise within the limits of the prison yard or of any of the prison buildings. They hold monthly meetings, audit all the accounts of the warden, make contracts for the labor of the prisoners, by one of their number visit the prison at least twice every month for purposes of inspection or for hearing the complaints of the prisoners, and have, in general, the complete oversight of the institution. The prison is divided into six departments, of general management, of labor and finance, of religious and other instruction, of sanitary condition, of repairs and of supplies. The first department is under the charge of two inspectors, one of whom is the chairman of the board; the other departments are under the charge

each of one inspector. The service of the board is rendered without any remuneration of any kind, except exemption from jury and military service. The prison at the present time is self-supporting. For the year 1872 the profits of both prison and jail amounted to \$4,518.90; in 1871 the income above expenses was \$3,018.46. The labor of the prisoners, shoe-making, is performed under contract, at the rate of 70 cents per day for state prisoners, 35 cents for jail prisoners, 17½ cents for prisoners who work less than thirty days. The whole number of convicts committed to the state prison since its opening, in 1838, is 692. The expense of maintenance *per capita*, for 1872, was \$110.75.

The Providence Reform School.

In May, 1847, the Providence Association of Mechanics and Manufacturers memorialized the city council of Providence for the establishment of a house of reformation. In 1850 an act was passed by the general assembly authorizing the city to establish a "school for the confinement, instruction, and reformation of juvenile offenders and of young persons of idle, vicious, or vagrant habits," the government of which was to be vested, as already stated, in a board of seven trustees. The trustees are empowered to receive into the school thus established all such children, under the age of eighteen years, who shall be convicted, before any court sitting within the city limits, as vagrants or disorderly persons, or of criminal offenses, or of offenses against the city ordinances, and such children as shall be convicted of criminal offenses before any court in the State, or of the United States sitting within the state limits. They may also admit any child above the age of five years, at the request of parents or guardian. Children thus sentenced or admitted shall be held under restraint for a term not longer than during their minority or less than two years, the trustees having the power of discharging such children as are considered reformed, before the expiration of their sentence, or of binding out the children as apprentices, or, in cases of incorrigibility, of remanding them to the county jail, house of correction, or state prison. They are, while inmates of the school, to be taught in virtue and morality, and in such branches of useful knowledge as shall be suited to their age and capacity. They are also to be instructed in regular courses of labor. The expense of maintaining the school is divided between the State and the city, the former paying the actual cost of supporting the children who have been sentenced by the courts, the latter paying for buildings, grounds, salaries, instructors, and the like. The cost of maintaining, deducting the earnings of the children, is estimated at the rate of \$110.87 for each inmate; without such deduction, \$218.60.

A large hotel in the south part of the city, overlooking a very beautiful prospect of Narragansett Bay and the adjacent shores, known to the traveling public of former days as the Tockwotton House, was purchased by the city of Providence, and the school was formally opened November 1, 1850. In January, 1854, the Hon. W. R. Staples, an eminent jurist of Rhode Island, delivered a charge to the grand jury, at the opening of his court, in which he speaks thus of the school: "It was opposed in the beginning by some of the citizens of Providence as not being within the range of objects properly belonging to a municipal corporation. On the trustees and other officers it imposed duties and responsibilities, every part of which to them was new and untried. They had gleaned some information from other similar institutions, but that knowledge was, of course, only theoretical. The buildings where

it is established were erected for very different objects, and of course are not so convenient or well adapted for its present use as one built expressly for such a school would be. Many are the disadvantages under which it has had to labor. Still, it has been more successful in its results than its friends anticipated, and promises to give effectual aid in diminishing the number of prisoners in our county jail and state prison." * * * * Its inmates, he goes on to say, within its walls "are secluded from all the associations which tend further to corrupt them. There, habits of industry, sobriety, and sober reflection are substituted for idleness, profanity, intemperance, and folly. There, all the deficiencies of their early moral culture may be supplied, and they have the benefit of good example, wholesome instruction, the means of improvement in virtue and knowledge, and the opportunity of becoming intelligent, moral, and useful members of society." Since the time at which this charge was delivered the school has been improved by the addition of new buildings, the extension of its grounds, and an enlargement of its means of instruction.

Within the last three years an addition has been made to the north wing of the main building—for the accommodation of the boys belonging to the school—furnishing accommodations for thirty-six dormitories, each 4 feet 6 inches by 8 feet, neatly furnished and amply ventilated; a large finely lighted school-room, 35 feet by 47 feet, and 12 feet high, furnished with desks for one hundred pupils, supplied with blackboards and all the necessary appliances for thorough instruction, and connecting with a large room—19 feet by 12 feet—for the library and class recitations; and a fine bath-room, with a tank 12 feet by 17 feet, and 3½ feet deep, with closets for clothes, &c. The building is of three stories—37 feet 6 inches by 62 feet 6 inches—with a slated French roof and a dry, large basement, under two-thirds, the other third forming a covered arcade for the protection of the boys from the weather while engaged in recreation in the yard. It is hoped that, before long, a similar building will be erected for the girls. It is very greatly needed, and has been earnestly recommended.

The number of inmates from the opening of the school to November 30, 1872, is 1,616 boys and 433 girls. The average number of months in the institution of those discharged has been, for all committed, 16.9 for boys, 22.2 for girls. Inmates have been received from every town and city in the State, except New Shoreham, and from one or two places beyond the territorial limits of Rhode Island. Instruction is given in reading, writing, geography, arithmetic, sewing, and other domestic labors. Gardening and fruit-culture have also received considerable attention, and the labor performed in the workshop amounts to a sum not far from \$20,000 annually. For the year 1872, the amount received from labor, \$21,977.46. The number of inmates committed during the year ending November 30, 1872, has been 103 boys and 10 girls; number discharged, 107 boys and 24 girls. The number in the school November 30, 1872, was 156 boys and 37 girls. The superintendent estimates that the system pursued is beneficial to the extent of reforming and saving to society about 75 per cent. of the boys and 50 per cent. of the girls. The institution is under the charge of a superintendent, an assistant superintendent, a matron, an assistant matron and nurse, physician, steward, two male and two female teachers, four male and five female overseers. Religious services are held every Sunday afternoon, conducted by members of the board of trustees, or by gentlemen invited by them for the purpose. A Sunday-school is held every Sunday in the forenoon, 9½ to 11. The trustees hold quarterly meetings in

March, June, September, and December. A committee of the trustees meet twice each month for visitation and other necessary business. They perform their duties gratuitously. They declare, in their last printed report, that "the general condition of the institution is entirely satisfactory to the trustees, and its prospects of usefulness in the future highly encouraging." The system of management, discipline, &c., is the "congregate." The lady visitors are of the opinion that, for the girls at least, the family system would be preferable.

The state farm.

At the January session of the general assembly in the year 1867, a committee was appointed to "inquire into the expediency of erecting a state asylum for the insane." At the January session in the year 1868, the committee reported favorably upon the subject, and a new committee was appointed for the purpose of selecting a suitable place for such an institution—it being understood that a tract of land containing not less than 200 acres should be purchased. In the view of this committee, a necessity existed for a new house of correction, as well as an asylum for the insane. In 1869, at the January session, a third committee was appointed, with power to buy a suitable farm for the two institutions and "for such other purposes as the general assembly may direct." The committee was also instructed to report a "plan for the organization and establishment of a house of correction and state pauper system." A tract of land, containing 398 acres, finely situated, in the town of Cranston, was purchased for the sum of \$27,500, and soon after the 1st of June, 1869, came into possession of the State. On the 28th of May of the same year, an act was passed establishing a board of state charities and corrections. This board consists of six persons appointed for six years, two from the county of Providence, and one from each of the other counties in the State, with power to choose a secretary, who, by virtue of his office, becomes an associate member. The board was also directed to appoint a superintendent of state charities and corrections, to whom was to be committed the duty of overseeing the general business of the board, of examining paupers and lunatics, and of removing them to their proper "places of settlement." The act contemplated the erection of a state workhouse, a house of correction, a state asylum for the incurable insane, and a state almshouse. The inmates of the state workhouse were to consist of persons who had abandoned, neglected, or refused to aid in the support of their families; idle persons, of doubtful reputation, and having no visible means of support; sturdy beggars, vagrants, prostitutes, common drunkards, night-walkers, lewd and lascivious persons, frequenters of places of ill-repute, cheats and disorderly persons—and these were to be sentenced for a term not less than six months nor more than three years. The board can require any steamship or railroad company to make returns of the names, sex, ages, and nativity of any class of passengers brought into Rhode Island, and the company is liable for the support of any pauper thus introduced into the State for the period of twelve months, or for his return to the place whence he was brought. The cities and towns in the State may send to the state almshouse all paupers not having a legal settlement within their respective limits. Any lunatic having no legal settlement in the State, but supported by any town or city, if incurably insane, may be sent to the state asylum, to be supported at the expense of the State. The incurably insane who have a legal settlement are to be sent to the asylum, to be supported by the town or city to which they respectively

belong. Any inmate of the reform school who may be considered incorrigible, or unfit to remain in said school, may be transferred to the state work-house. The board of state charities and corrections have the power of discharging any of the inmates of the institutions upon the farm, and of binding them out for service with suitable and trustworthy persons.

The board, immediately upon taking possession of the farm—increased by subsequent purchase to 417.7 acres—began the erection of buildings suitable for the reception of the expected inmates. Two workhouses and two buildings for the insane were erected during the year 1869; an additional building, for the accommodation of the violent insane, and a chapel were erected in 1870. In 1871 measures were adopted for building a strong workhouse, which could also be used for a house of correction, which, it is expected, will soon be completed and occupied. It is constructed of stone, and will provide for the accommodation of “two hundred male and one hundred female inmates, properly graded, with complete separation of the sexes.” Religious services have been held from time to time, conducted by different gentlemen and ladies, and a Sunday-school was in successful operation during the years 1870 and 1871. A fire at the farm in April, 1872, destroyed the chapel and interrupted both the school and Sunday services.

The amount expended for all purposes at the farm from June 1, 1869, to January 1, 1873, has been \$371,444.15. The property is valued at \$212,227.07. It is believed that the amount has really been more than saved to the State by the removal of paupers not belonging to the State to their proper places of settlement and abode. The whole number of inmates received at the state workhouse from the beginning to January 1, 1873, is 1,271, of whom 359 were females and 912 were males; of these 695 were of foreign parentage. The whole number of insane persons received at the farm is 239; the number remaining January 1, 1873, was 153—70 males, 83 females. The board of state charities is organized with a chairman and secretary and five standing committees: 1, on the farm; 2, on supplies; 3, on buildings and repairs; 4, on labor and discipline; 5, on finance and audit of accounts. The executive officers are a superintendent of state charities and corrections, a superintendent of the state farm, a deputy superintendent of the workhouse, a deputy superintendent of the insane asylum, and a physician. Under-officers, matrons, &c., are appointed according to the needs of the institution. The board serve gratuitously, except that their necessary expenses for traveling and attendance upon their meetings are paid by the State.

The objects proposed by the establishment of the state farm were, 1. The removal of paupers, not domiciled in the State, to the places where they really belonged. 2. An improvement in the care of paupers and the insane poor, which was greatly needed in Rhode Island. 3. The reformation of vagrants, drunkards, abandoned women, and the like. The first two of these objects have been fully attained. In the years 1870 and 1871, 465, in 1872, 125 paupers were removed from the State. The insane department is regarded with peculiar satisfaction. “The unfortunate persons in that department,” says the secretary of the board, “are made comfortable and as happy as is possible for them to be. It is certain that the condition of those brought from town poor-houses is greatly improved, and even those brought from our best hospitals profess to be pleased with the change.” In regard to the third object proposed, results have not been so satisfactory as was anticipated. It was hoped that absence from temptation, the benefit of pure air and simple food, regular habits, out-of-door work, surrounded by scenes of natural

beauty, and wise and careful instruction and oversight, would materially aid in reclaiming those unfortunate persons who are overcome by appetite and lust. Sentences were made, in a measure, indeterminate, the board having power to discharge those who are considered as having been benefited by their restraint. It is estimated that but very few persons have thus far been reclaimed from dissipation and vice. The board believe that a larger number than ever before has been benefited during the last year. The secretary, in his report for 1871, regards the moral and reformatory agencies as a failure. He attributes the poor results in this direction to three causes: 1. "The depravity of the human heart when educated in a course of dissipation." 2. "The situation and circumstances of the workhouse itself, the crowded halls and dormitories rendering all privacy impossible." The building used as a workhouse is evidently unfit for the purposes of its erection. 3. The shortness of the time of sentence. Half a year, which is frequently the term of sentence, is too brief for weaning these men and women from the habits of nearly a lifetime. He suggests as remedies, 1. Longer sentences. 2. A complete change in the internal arrangement of the workhouse, which he hopes will be effected in the new building. 3. Greater efforts to awaken the minds of the inmates, and to give them proper instruction in evening and other schools, and by familiar lectures and addresses and religious exercises on Sundays. The board, however, feel assured that better and more encouraging results have appeared within the past year, and they look forward hopefully to the future. Still it must be borne in mind that our state farm is of very recent establishment, and is yet to be regarded somewhat in the light of an experiment. The buildings were hastily erected, and were at once crowded with occupants. An imperfect system of organization prevailed, and affairs became somewhat chaotic. Such is always the case with a new enterprise which is hurriedly undertaken, for the supply of an immediate and pressing need. As more suitable buildings shall be erected and a more thorough system of government come into operation, there can be no doubt of beneficial results. A judicious and persevering effort to treat the whole subject of reformatory and punitive discipline with practical sagacity, with scientific method, and a humane spirit, cannot fail of success.

Board of female visitors.

The board of female visitors to institutions where women are imprisoned was constituted in the year 1870. It consists of seven ladies, appointed annually by the governor. These ladies visit the different penal and reformatory institutions in the State, and are organized with a president, secretary, and three committees: 1. To visit the state prison. 2. To visit the Providence reform school. 3. To visit the state farm. Their duty is to visit and inspect these places, converse with the women and girls there under restraint, and offer such suggestions as they think are necessary in the cases which come to their knowledge. It is believed that their work has been efficient and valuable, and it is hoped that ere long separate prisons and reformatories for women will be established, to be wholly under the control of persons of their own sex.

Commutation.

In order to complete the view here given of our treatment of the criminal class under sentence, I would say, in addition, that a system

of commutation prevails in the state prison, allowing to convicts for good behavior one day in each month for every year of sentence below five years; and that it is in contemplation to allow convicts a certain portion of their earnings. Capital punishment was abolished in Rhode Island in January, 1852, and imprisonment for life substituted for the penalty of what had been known as capital crimes. In December, 1872, death by hanging was declared to be the penalty for murder committed while in prison by a person under life-sentence.

Discharged prisoners.

A society for the aid of discharged prisoners was organized in Providence, in March, 1872. Its officers are a president, vice-president, secretary, and treasurer, and an executive committee, composed of one person from each of the boards which have been mentioned. The society, having had but a brief existence and a small membership as yet, has not been able to accomplish much more than a preparatory work. But few applications have been made for aid, as the state prison authorities have an arrangement with the contractors at the prison to furnish employment in their outside shops to such discharged convicts as have proved themselves good workmen, and have earned a certificate of good behavior. As the means of this society increase, it is expected that more complete study of the subject of prison discipline will be entered upon, with a view to ascertain the best methods for working out the desirable result of the reformation of the criminal. The society has the sympathy of the best members of our community, and a future of prosperity and usefulness is confidently anticipated.

Main features of Rhode Island prison system.

The main features of the Rhode Island system of prison discipline are: 1. The authority given to the several boards of trustees and inspectors to direct and control the management of the several institutions without interference from any quarter, to appoint the officers, to manage the finances, to arrange for the labor and instruction of the inmates, and, in some instances, to discharge the prisoners. 2. The entirely gratuitous services of such boards of direction. 3. The freedom from political bias in making the appointments. 4. The existence of a board of female visitors. 5. The abolition of the death penalty, except in cases of murder committed in prison by a prisoner under life-sentence. 6. A system of commutation. 7. A partial system of classification of prisoners.

21. SOUTH CAROLINA.

By General J. C. Stolbrand, superintendent of the state penitentiary.

Liberally as the people of the State have heretofore contributed to build up and maintain charitable institutions for lunatics, orphans, deaf-mutes, and other classes of unfortunates, there were in the State, previous to the termination of the late war, no penal or reformatory institutions of any kind.

The district county jails were then, even more than now, of the rudest and most primitive kind.

This state of things was probably owing to the severity of the then criminal laws, (now much modified and milder,) under which were inflicted capital punishment upon such criminals as now, in almost every State of the Union, receive sentences of from two to ten years imprisonment with hard labor.

In 1866 Governor James L. Orr, with admirable tact and foresight, succeeded in securing from an unwilling legislature a small sum of money for the purpose of constructing, temporarily, a place of safety for such offenders as might prove, under the new order of things (emancipation having become of effect) too dangerous to the community, and upon whom the death penalty, according to then existing statute, seemed too severe.

From this action on the part of Governor Orr originated what is now known as the South Carolina penitentiary.

In 1868, after the reconstructed government of the State had come into operation, under the new constitution, it was decreed by the legislature that the penitentiary at Columbia should be the general penitentiary and prison of the State, for the reformation as well as the punishment of all offenders. Ground was broken for the institution, November 17, 1866, but no convicts were received until April 18, 1867. Since then the institution, for want of means, has advanced but slowly in the way of erecting and completing the necessary buildings.

Since the last-named date no hired labor (except foremen in the different branches) has been employed. The quarrying and cutting of the granite for the buildings, the weaving of the cloth and making it up into garments, the cooking, washing, shoemaking, &c., have all been done by the convicts.

The plan of the prison provides for the erection of five hundred cells, divided into two wings, which are to be united by a central building for the administration. There are now three hundred and forty cells mostly ready for occupancy under a temporary roof, which serves for shelter until the inclosing wall shall have been completed and permanently roofed.

A school has been organized, under a competent teacher, which promises good results. Religious service is regularly maintained on the Sabbath, and a Sunday-school has been in operation for about two years.

The first official report of the institution was dated January 1, 1868, and states that the inmates then numbered 187; in 1869 the number was 222; in 1870, 317; in 1871, 309; and in 1872, 300. The number of whites has not varied materially from 10 per cent. of the whole number. Considering that this is the only penal institution in a State of 720,000 inhabitants, it is believed that the number of criminals compares not unfavorably with other States.

Theft is the besetting sin in this commonwealth. More than five-sevenths of our criminals have become such under that designation. About one-seventh have committed offenses against the person by violence, while the remaining seventh comprises offenders of all grades and descriptions.

It is to be hoped that a proposition now before our legislature to establish a reform school for boys may result in the consummation of so needful and desirable an end.

Any one giving even a casual glance at our social condition and development will be struck with the illiteracy and ignorance of a great majority of the people. That this is owing to our former system of slavery is not doubted. The only remedy lies in the gradual extension

of the common school, whose widening and beneficent influence is, even at this early period, felt in every part of the State.

22. TENNESSEE.

By W. M. Wright, M. D., superintendent of prisons.

In the absence of my annual report, made last week to the legislature, but not yet published, I beg leave to submit the following brief statement of facts with regard to the state prison of Tennessee: There are now in the penitentiary at Nashville, and its branches throughout the State, 744 convicts. Of this number about 400 are colored; 35 are females, only one of whom is white. In December, 1871, the legislature leased the state-prison, including its branches, to a private company, at \$33,000 a year for five years, the lessees paying all expenses. By a stipulation in the contract the State retained entire control of the treatment of the convicts. For four years preceding the lease, the prisons cost the State \$114,000 annually. The legislature, to get rid of this heavy burden, and at the same time do exact justice to the criminals, according to the enlightened philanthropy of the age, entered into the above-mentioned contract, with the necessary restraining provisions to guard the moral interests of the convicts. The legislature believed, and their wisdom has been justified, that they could lease out the prisons and at the same time introduce and carry into effective operation all the reformatory measures consistent with the good government of penal institutions and the well-being of society. The measures adopted for the reformation of criminals are the commutation or good-time law, the regular employment of chaplains, who have service every Sunday morning and Sabbath-school in the evening, the distribution of good books, periodicals, &c. I can see very little difference in the means used in Tennessee for the reformation of criminals and those employed in other States whose reports have been read to this body. I only consented to make these few remarks that the congress might know that Tennessee is not an idle or indifferent spectator of the grand reformatory revolution in the management of criminals, which is engaging the best minds of our country and enlisting the active sympathy and intelligent study of every civilized country throughout the world. The plan adopted in Tennessee works well and is satisfactory.

23. TEXAS.

By Rev. Benjamin A. Rogers, commissioner to the International Penitentiary Congress of London, and president of the prison reform association of Texas.

The State of Texas has an area of 338,000 square miles, with 136 organized counties, and a population of nearly 900,000 souls; of which a fraction over two-fifths are colored. In territorial extent it is the largest State in the American Union, having also the greatest diversity of climate, soil, and productions. With its vast sea-coast, its navigable rivers, its rapidly extending railroads, and its swelling tide of immigration, it may perhaps be allowed to count itself among the most prosperous of States; and it is utterly without excuse if it fails to enter, with vigorous step, into every reform that tends to the safety, progress, and

happiness of a people. But notwithstanding the flood of light that the last fifty years have thrown upon the subject under consideration in this report, Texas is to-day wholly without public reformatory institutions (usually so denominated) of any kind. Its barrenness in this regard is not without, at least, one advantage: its field of operations is an open one; where nothing exists, there are no errors to be corrected, no strong prejudices to overcome; and much may be hoped from time and effort.

The State has but one penitentiary, or state prison, which is located at Huntsville. Nearly every county has its jail. As to the number, sex, and ages of prisoners, whether in the penitentiary or jails, I cannot speak with any degree of accuracy, as I have been unable to obtain answers to my questions addressed to the penitentiary contractors, though strongly seconded in my efforts by the governor of the State. I suppose the penitentiary convicts number from 600 to 800 persons, and the inmates of the jails as many more.

There is no central authority charged with the administration of the prison system of the State. Each county has charge of its own jail affairs. The consequence is, that the jails are mere filthy pens, or horrible dungeons, where, in many instances, all sorts of criminals, all ages, and both sexes, are herded together, like cattle; often with little air, little light, and no cleanliness. The county courts are responsible.

The penitentiary being in the hands of contractors, the administration of its discipline is very largely in their hands also. The discipline is simply deterrent; or at least it is so intended. The agencies adopted are labor, the dungeon, and the stocks—the last too liberally used.

There is no provision of law for instruction of the convicts, except in labor; and what is not provided for by law is not likely to be furnished by contractors, whose business it is to make all that can be made out of the convicts' labor, regardless of higher ends.

In the penitentiary itself, various kinds of manufacturing are carried on. But much convict work is performed outside, as the contractors are allowed to put the convicts upon the railroads of the State, where they work under an armed guard. This, while it sometimes ameliorates the immediate condition of the prisoner, is really a pernicious system. It encourages attempts to escape—sometimes resulting in success, and thus cheating society of its security; sometimes issuing in capture and punishment, thus subjecting prisoners to unnecessary suffering; and sometimes leading to the shooting down of the convict, a waste of life without necessity, and so without right.

Larceny, burglary, and injuries to the person, particularly the first, are the most common forms of crime; ignorance, intemperance, idleness, poverty, and want of early training, are the predominant causes.

Two years ago Governor Davis, in his annual message to the legislature, urged a thorough reform of the prison system of the State, but no legislative action was obtained. Within a few weeks past great public interest has been aroused by a thorough exposure, in a public lecture, delivered at the State capital, of the enormities of the existing systems, both jail and penitentiary, from which has resulted the formation of a "prison reform association of the State of Texas," one of the avowed and leading purposes of which is "promoting such legislation as shall reform the present prison system and discipline of the State."

The membership of this association embraces some of the best and most influential men of all parties in the State, among whom are its highest officials, the governor, the secretary of state, the State treasurer, the attorney-general, the comptroller, and the judges of the supreme court;

also, some of the most influential members of the bar from different parts of the State. The newspapers of the State, without regard to party, are also earnest in the advocacy of reform, and much of hope lies in the future of this association.

This association has already prepared and proposed to the legislature the passage of three separate bills. One of these bills provides for a complete re-organization of the county-jail system of the State; another provides for the erection of a new penitentiary, to be conducted substantially on the Crofton system; and the third proposes for each county in the State a "county farm," with poor-house, house of correction, and reform school. All the above bills were referred to committees. Favorable action is hoped upon some of them at once, and upon all in time. The urgent need of reform in all these points may be inferred from the statements made in this report, and also from those contained in the following extracts from a communication made to the legislature by the writer of the report, and which is hereto appended as a part of his statement:

It is believed that no other civilized State upon the earth has so terrible a jail system as ours. The hundred jails in this State are to-day a hundred dens of suffering, crime, and infamy; a hundred schools of poverty, vice, and shame; a hundred plague-spots upon the body politic, and a hundred sources of disgrace to morality, to religion, to the State. And it were well if this were all. But, with nearly a thousand penitentiary convicts, we have to-day accommodations for only two hundred and eighty-eight; and, again, with thousands of suffering paupers there is not a poor-house in the State. Again, with thousands of children, orphans, and outcasts falling into crime, we have not one single house of correction or reform.

Why is this? It is a well-established law of political economy that humanity itself is of the greatest value to a State, and that a careful regard for it is a State's first duty.

What is being done for humanity here? Where does Texas look for her future prosperity? Is she willing to risk the experiment of letting poverty and suffering, the very parents of degradation, go on unnoticed and unchecked?

All these things are in your hands, gentlemen, and may not the good citizens of the State hope that, among the four hundred bills before you, the two or three looking to the suppression of suffering and crime may be deemed worthy of notice?

24. VERMONT.

By Rev. Franklin Butler, chaplain of the state prison.

Vermont is an inland, agricultural State, containing an area of only 9,056½ square miles, or 5,795,960 acres, and having a population of 330,551 in 1870. The Green Mountains extend through the entire length of the State, dividing it from north to south into two nearly equal portions. It has only two incorporated cities, and but few towns in which the number of inhabitants exceeds five thousand or even two thousand souls. It is eminently a rural commonwealth, in which there are no great centers of influence of a social, moral, or political nature.

Vermont has three colleges and an academical and common-school system, of which, although perfection is not claimed, her sons are never ashamed to make mention.

In Christian churches she abounds, and in her men and women trained up in her mountain homes, she, if any State, may glory. But, despite these advantages, here, as elsewhere, vice and crime exist; and the demand for earnest attention to the prevention and cure of the same is most imperative and urgent upon Christian patriots and philanthropists.

In attention to this latter point, Vermont has not much whereof to

boast; and, indeed, it may as well be plainly confessed that, herein, she is considerably in the rear of some of her younger sisters.

The penal and reformatory institutions of the State are: I. The state prison; II. The county jails; III. The State reform school. To these may be added, as institutions bearing directly upon the prevention of crime: IV. The home for destitute children, at Burlington V. Other preventive institutions.

I.—*The state prison.*

This is situated at Windsor, and is the first and only one ever built in Vermont. It was completed and occupied in 1809, eighteen years after the admission of the State to the Union. Previous to that time, such temporary expedients for the public safety and the punishment of offenders were adopted as were deemed practicable for the unsettled civil and political condition of the people. The building, 84 feet long by 36 feet wide, three stories high, was constructed of granite, the outside walls being 3 feet thick, and the partitions of apartments into which it was divided being 18 inches in thickness. The rooms were made for the occupation of several convicts at a time; and they were lighted, in the first and second stories, only by a small aperture in each for the admission of light and air. This building was considered large enough for 170 inmates. Adjoining it, a building 54 by 24 feet, and four stories high, of stone and brick, was erected for the use of the keepers and guards. Walls of hammered stone and brick, 20 feet high and 4 feet thick at the base, inclosing a yard 16 by 12 rods square, were also raised. Within the yard was a workshop, 100 by 24 feet, and three stories high.

In 1832 a new cell building was constructed, containing 136 cells, each designed for one prisoner. It has, however, been since re-arranged, and the cells so enlarged as to reduce the number to 104. This building is appropriated to the men, while the upper part of the old structure is used for the confinement of women.

From 1809 to 1872, 2,101 persons have been committed to this prison, averaging a little more than 33 per year, the commitments of 1809 being 24, and those of 1872 being 32, and the population of the State being respectively 217,895 and 330,551. The highest average term of sentences, less than life, during this period is six and two-third years, in 1809, and the lowest is two years, in 1867, while the general average is a little over three years. Nineteen have been sentenced for life. The pardons number 724, the greatest number having been in 1821, when it equaled the number of commitments, viz, 27. The least number was zero, for neither in 1809 nor in 1842 were any pardons granted. The escapes, in the sixty-three years, amount to 26, being less than one in two years. The death rate on the whole number has been a little more than one-third of one per cent.; on the average number about one and one-third per cent.

The practice of industrial labor has always been regarded as of primary importance, as well to the interests of the inmates themselves as to those of the State. Various kinds of labor have been pursued, both on contract and under the management of the officers. At present the work is exclusively ladies' gaiters, on contract, at 70 cents per day, which yielded to the State, in 1872, an excess of income above expenditures, amounting to \$3,654.31, and there is a fair prospect that the excess will exceed that amount for some time to come.

The discipline is in the hands of the warden, who administers it with

mingled kindness, firmness, and justice. Solitary confinement in a darkened cell generally suffices for correction, although the block and chain are in rare cases found necessary. As an inducement to good behavior, a commutation law has been enacted by the legislature, by which an abatement from the sentence for good conduct may be made, by the governor, on recommendation of the superintendent. This law has had a most benign effect upon the inmates.

Secular instruction to the inmates is not required by law. More or less, however, according to the circumstances, is given in some form, by the chaplain or other officers. A library of nearly 500 volumes is provided, and an annual appropriation is made for its maintenance and increase. To this, all who can read have access.

Religious instruction is provided for in the chaplaincy, the duties of which are those usually appertaining to the office of the minister of the gospel in preaching the word, visiting the sick, instructing, counseling, encouraging, and helping, with the truths of religion, the erring and fallen, to self-respect and self-conquest. He holds regular religious services every Sabbath, and performs such other labors as the varying circumstances require. Music being regarded an important aid to reformation, its use in worship and its practice for that end are encouraged in all who have any aptitude for it.

No provision is made, either by the State or by organized private benevolence, for aiding convicts to employment and usefulness on their discharge. The superintendent, in accordance with established custom, provides a decent suit of clothes for them, and gives them a small sum of money to help them to leave the place, but nothing more is usually done in the name of the State. Individuals, in a quiet way, often help them to employment, or afford other aid.

II.—*The county jails.*

There are fourteen counties in Vermont, with a jail in each. They generally consist of one or two large rooms and a few cells, designed for transient safe-keeping of persons arrested, and for the punishment of those convicted of minor offenses, and sentenced to a few days or a few months of imprisonment.

In some of the jails religious meetings on the Sabbath are regularly held by Young Men's Christian Associations or other organizations, but this is by no means the case in all.

Some effort has been made to induce the legislature to make careful inquest into the condition and administration of the jail system, or rather want of system; but, as yet, no practical results have appeared. They are still mere tarrying places for the guilty or the innocent, as the case may be, in which a brief confinement often proves, through association with hardened criminals, the introduction to life-long crime. Governors have called attention to the subject, editors have discussed it, and intelligent citizens have expressed their opinions; but no steps have yet been taken toward improvement.

III.—*The State reform school.*

In 1865 an act was passed, establishing a State reform school. It was organized on the family system, but has been changed to the congregate. None are admitted who have passed the age of sixteen. Both sexes were at first received; but that plan was not found to work well,

and at present only boys are received. Originally the law allowed sentences ranging from six months to "during minority." Experience demonstrated the inexpediency of this provision, and now the latter is the only sentence; but the authorities have power to discharge conditionally whenever, in their judgment, it may be wise to do so. It is essentially a *preventive* institution, being designed rather for vicious and neglected children than for those actually criminal. Although, from the shortness of the time during which it has been in operation, large results have not yet appeared, enough has been accomplished to justify the outlay of labor and money expended, and to give promise of a rich harvest in the coming years.

IV.—*The home for destitute children.*

The home for destitute children, at Burlington, was founded in 1865, mainly through the efforts of Miss Lucia T. Wheeler, daughter of the late President Wheeler, of the Vermont University. During the first six months twelve children were received. It was opened in a private house; but as the number of applicants soon exceeded the means of accommodation the marine hospital building was purchased, in 1866, and devoted to the uses of the institution. A permanent fund of \$50,000 for the home is nearly completed. Originally the institution was designed chiefly for destitute children of Burlington, but it is now open to those of all parts of the State. It has been in successful operation for seven years, under the efficient management of an association of benevolent ladies. During this period, it has received 170 children; of whom 79 have been provided with homes in private families, chiefly in this State. Some of them have been legally adopted, and others bound out until eighteen years of age.

The working force of the "Home" is composed of a matron, a teacher, a seamstress, and a cook. The school is regarded as equal to any public school of like grade. During the year 1872, twenty-eight have been received; nineteen have been provided with homes; and several, having reached their majority, have been discharged. The present number in the home is thirty-five. The value of this institution, as a preventive of evil and an agent for good, can scarcely be computed, and its friends may well rejoice in the success of their noble work.

V.—*Other preventive institutions.*

There are one or two other institutions or schools in the State for the young, similar in nature and object to the home at Burlington, originated and sustained by Roman Catholics; but, having no definite information concerning them, I am unable to do more than state the mere fact of their existence.

Conclusion.

Such is an imperfect sketch of the penal and reformatory institutions in this State. The facts are submitted in the belief that if, in some things, Vermont falls in the rear of some States in the great enterprise of true prison reform, it is not by reason of the lack either of eyes to perceive her deficiencies, or of head to find the remedy, or of heart to press the application. Vermont may be in the rear, but she is not asleep.

25. WISCONSIN.

By Samuel D. Hastings, secretary state board of charities and reform.

The State of Wisconsin contains a population, according to the United States census of 1870, of 1,054,970, of which number 690,471 were native and 364,499 foreign-born.

The State is divided into fifty-eight counties, forty-nine of which have jails, in which persons awaiting trial charged with crime and those convicted of minor offenses are confined.

In most of the counties the jails are small and insecure, deficient in ventilation, with no facilities for bathing, with no arrangements for a proper classification of their inmates by which the young lad, confined for some petty misdemeanor—his first offense—can be separated from the old and hardened offender, and are so managed that the prisoners are compelled to pass their time with no employment other than to corrupt each other and to devise plans for future depredations upon society, and with nothing done with a view to the reformation or the intellectual or moral improvement of the prisoners. Within the past few years a few good buildings have been erected, free from some of the defects alluded to above. The buildings have been made comparatively secure; good ventilation has been attained; in one or two cases bathing facilities have been provided, and better arrangements for classification have been made; but, after all, glaring defects still remain.

The aggregate number confined in the forty-nine jails of the State during the year 1870 was 1,502; the aggregate number in 1871 was 1,456; and the number in the jails on the 1st day of August, 1872, 166. The time of confinement varies from a single day to a year or more.

Of the number in the jails on the 1st day of August, 1872, 60 were insane, confined there for the lack of a better and more appropriate place in which to put them. A second state hospital for the insane is now nearly completed, and, when opened, the insane will all be removed from the jails.

The most important reformatory institution in the State is the Industrial School for Boys. The following interesting account of this institution has been kindly prepared by Mr. A. D. Hendrickson, the superintendent:

This institution was opened at Waukesha in July, 1860. In his opening address Mr. Cogswell appropriately said: "Wisconsin inaugurates to-day the noblest of her institutions—penal, reformatory, educational, or charitable." This institution was first known as the house of refuge, but the legislature changed its name to reform school, and still later, in 1871, to Wisconsin industrial school for boys. Girls were originally admitted. Recently an act has been passed to exclude them.

The number of boys, from the commencement to January 1, 1873, covering a period of twelve and one-half years, is 832; total number of inmates of both sexes, 905.

The control of the institution is in the hands of a board of five managers, appointed by the governor for a term of three years. The board elects the superintendent and matron, who hold their office at its pleasure. The superintendent names all the assistants, subject to the approval of the board.

Boys are committed to the school between the ages of eight and sixteen years, as vagrants, or on conviction of any criminal offense, or for incorrigible or vicious conduct.

The managers have power to return any inmate to the care of his parents or guardian, or provide a home elsewhere, whenever in their judgment such disposition would be most for his future benefit; but unless he has reached his majority, his discharge is conditional, and, in case of misconduct, he is returned to the institution. Such returns will not average more than 5 to 7 per cent. This watchful supervision of the boys after leaving the school is of very great value. It is a kind of parental oversight, which operates as a constant restraint.

The average stay in the school is between two and three years. While a few are

discharged within three or four months, some remain six or seven years. The latter are generally those who have no homes outside, and, as a rule, they are the best fruits of our work.

The total current expenses of the school for 1872 were \$36,588.70. Of this sum the earnings of the boys amounted to \$6,351.06, two-thirds of which were the product of a farm of 233 acres, and one-third was the result of work in the shops.

This institution was first organized on the congregate system, and so continued until the main building was destroyed by fire, January 10, 1866. The institution was rebuilt on the family plan the same year. We have now a main building, containing school-room and residence of superintendent, and six family buildings. Each of these latter is designed to accommodate thirty-six boys, but want of room sometimes compels us to crowd forty or more into them. There are two stories above the basement. Each is provided with a boys' sitting-room, bath-room, and storage-room on basement floor; dining-room, library-room, and officers' sitting-room on first floor; and dormitory, dressing-room, and officers' lodging-room on second floor.

We have now been working under the family system for more than five years, and there is no wish to return to the congregate plan. Then the boys were locked in separate cells at night, confined within close yards by day, and strictly guarded at all times. Now each family lodges in a common dormitory, which is well lighted and well ventilated, with no more bolts and bars than are needed in common dwellings. Our grounds and surroundings are open, pleasant, and homelike.

From eight to nine hours of each day are devoted to active employment, about equally divided between labor and school. Our employments are farming, gardening, shoe-making, tailoring, broom-making, willow-ware making, cane-seating, knitting, and domestic work. A principal and four assistant teachers are employed in giving scholastic instruction to the boys. The common English branches are taught; also history, physiology, and occasionally other branches of natural science and mathematics. Religious instruction is regularly imparted, but without denominational bias. No regular chaplain is provided. Ministers of different denominations officiate. In the absence of such, the superintendent conducts the religious services. Besides public worship on the Sabbath, a Sunday-school is regularly maintained. All the inmates assemble daily in the chapel for public prayer. A library of 800 to 900 volumes, and a generous supply of magazines and papers, adapted to the ages and capacities of our boys, constitute the reading matter provided.

Vocal music is cultivated with very satisfactory results. For the past four years we have maintained a brass band, which has been a source of much gratification, and is found useful as well as ornamental.

The most serious difficulty which this reform work has to contend with is the lack of the whole-souled earnest men and women to take the position of house-fathers and mothers, to educate and train up these young wayward sons of the west in the way in which they should go.

The State is doing its part in this noble work, but there is a part that the State, unaided by individual effort, cannot do. Here is work for the Christian and the philanthropist. The missionary may here find a field of labor without crossing the seas; a field of labor that will prove remunerative to both the teacher and the taught. Here he can snatch a fellow-being from the brink of crime and infamy, and send him out into society a good man, an honest citizen. He may save a soul from death, and hide a multitude of sins.

The following report on the state prison has been kindly furnished by the Hon. George F. Wheeler, state prison commissioner:

The Wisconsin State prison, at Waupun, was opened to receive convicts in the spring of 1852. The whole number imprisoned here since the opening has been 1,718. The average number at present is something less than 200.

The administration of the prison is in the hands of a commissioner, who is elected by popular suffrage biennially. He appoints all subordinate officers, and has full control of the business and discipline of the institution.

The conduct of the prisoners is, with few exceptions, good. It is the aim to maintain the discipline by kind measures rather than by harshness, and a resort to the severest punishment (confinement in a dark cell) is rarely necessary. A strong incentive to good conduct is the shortening of the term of service as a reward to good behavior.

The governor has the power of pardon, but in order to its exercise he must have a certificate from the prison commissioner stating that the conduct of the applicant has been good during confinement; and, in case the convict has been sentenced for murder, he must also have the recommendation of the judge who tried the case.

A school is maintained by the chaplain of the prison, in which from one-fourth to one-third of the convicts receive instruction on Sunday afternoon in the common-school branches. Although a large proportion of the prisoners are recorded on entrance as able to read and write, yet their knowledge of even these rudimentary branches is very slight, and the school has wonderfully improved very many of them. In addi-

tion to the school, there is, as a means of instruction and amusement, a library of about five hundred volumes.

The convicts are employed, under the management of the administration, in several kinds of mechanical work. They cut stone, manufacture cabinet-work, and make chairs. For this last work, which is carried on to even a large extent, the prison has very complete shops and machinery. Shoemaking and tailoring are also carried on in the prison. Besides this, the prisoners do all the necessary work of the establishment.

The sanitary state of the prison is good. Notwithstanding the fact that many of the convicts are received in a more or less diseased condition, incident to a vicious life, or are debilitated by close confinement in jails, the average health is as good as it is outside.

The most common cause of crime is drunkenness, which often, perhaps usually, accompanies idleness.

The State employs a Protestant chaplain, who gives his time entirely to the institution; and there is also a Catholic chaplain, who makes monthly visits for the benefit of the adherents of that faith. In addition to the duties proper of the regular chaplain, he has the direction of the school and is in charge of the library. In his efforts for the moral and spiritual improvement of the prisoners, the chaplain has the assistance of volunteer laborers from among the philanthropic citizens of the village.

In addition to the state prison, jails, and the industrial school for boys, we have an institution in the city of Milwaukee, known as the Milwaukee house of correction. This prison is for the reception and treatment of vagrants, disorderly persons, able-bodied paupers, and persons convicted of minor offenses. The inmates of the house of correction are kept at work in association by day under the rule of silence, and sleep in separate cells at night. The whole number imprisoned in 1872 was 647, and the average number during the year was 68. The number discharged was 579, of whom 514 were men and 65 women; 177 were natives, and 402 foreigners.

With a population of over twelve hundred thousand, the average number of inmates in the State prison was during the past year but	200
The number of persons confined in the jails of the State on the 1st day of August last, deducting the insane, (which is probably a fair average for the year,) was.....	106
The average number in the Milwaukee house of correction during the year was.....	68
Making a total of	374

Is there any State in the Union that can show a better record in proportion to its population?

The following extract from the recent message of Governor Washburn to the legislature will be interesting in this connection:

There is no subject more worthy of the careful attention of the legislature than that of our penal institutions. The best of men have been divided in opinion as to the best methods of treatment for the vicious and criminal portions of society. For some years past more attention has been given to the reformation of our criminal classes than formerly, and punishments have assumed a less vindictive character.

In July next twenty years will have elapsed since the death penalty was abolished in this State. The experiment met with strong opposition from a large portion of the people of the State who predicted that a large increase of crime would result from the change. That prediction happily has not been verified, and the facts which I am about to state conclusively show that no State in this Union can boast greater exemption from crime than Wisconsin. With a population of 1,200,000, representing almost every nationality, and two-fifths of foreign birth, statistics show that crime, instead of increasing with the growth of the State, has actually diminished. This is in a great degree due to a high-toned public sentiment, which causes the violated laws to be promptly vindicated.

Since the abolition of the death penalty, there have been tried, convicted, and sentenced to the penitentiary for life, 71 person in all. Of that number, 36 now remain, the rest having either died, been pardoned, or discharged by proper authority. There can be no doubt that the change in the law has rendered punishment much more certain, and I but express the opinion of those who have most carefully consid-

ered the question, as well as my own, when I state that but for that change in the law, at least one-half of those heretofore convicted would have escaped all punishment, so difficult is conviction when the penalty is death. In the five years that elapsed from 1848 to 1853, I have no knowledge of more than one person having suffered the extreme penalty of the law. This was not because of lack of offenses, but of the extreme difficulty of conviction.

In the year 1854, the number of convictions for the crime of murder was three; in 1855, three; in 1856, three; in 1857, three; in 1858, five; in 1859, none; in 1860, two; in 1861, none; in 1862, two; in 1863, eight; in 1864, none; in 1865, five; in 1866, one; in 1867, four; in 1868, five; in 1869, two; in 1870, four; in 1871, three; in 1872, one. I have taken some pains to learn what the conduct has been, since discharged from prison, of those convicted of the crime of murder who have been pardoned, and I have failed to learn of any instance where the party had rendered himself amenable to the law. On the contrary, so far as known, they have proved honest and peaceable citizens—extremely careful and circumspect in their intercourse with their fellow-men.

TERRITORY OF UTAH.

By A. P. Rockwood, warden of the Territorial penitentiary.

For about sixteen years my attention has been officially called to the manner of executing the sentence of the court on convicts committed to the Utah penitentiary. My experience has been five years as inspector and eleven years as warden.

Laws are supposed to be made to fit the circumstances under which they are to be administered; the laws applicable under one set of circumstances may not be under another. In Utah we have no intermediate prison or house of correction created by the territorial statutes; consequently, the law endows the warden with large discretionary power. Under its provisions he is authorized, with the approval of the directors, to hire out any or all of the convicts on any public or private works. As we have no house of correction for juveniles, all persons convicted of high crimes or misdemeanors are sent to the penitentiary. Under the provisions of the law, I exercised my discretion in the classification of the convicts.

The first class consists of old offenders or desperadoes, who may be generally considered past reclaiming. These, however, as well as all others, I endeavor to govern by kindness, and to create within them the sentiment of hope, without which the heart faints. I cannot better illustrate this point than by relating a circumstance that occurred some years since. Two of this class were arrested for horse-stealing, and, for want of bail, were committed to the county jail to await trial. While there they boasted, in presence and hearing of the keepers, of what they would and would not do when they were committed to the penitentiary, all of which soon came to my ears. This enabled me to prepare for them. In the early part of June they were delivered into my hands. I bade them make themselves comfortable and contented, and they would be properly cared for. When supper-time drew nigh, I asked them if they were fond of bread and milk. They made answer that they were very fond of it, but had not had the luxury for several years, adding that it would remind them of their childhood home, when mother used to serve it out. Soon I went in with the coveted meal, and with it a bowl of strawberries. They fairly laughed for joy. Next morning beefsteak, vegetables, bread, and milk were served for breakfast, the sight of which made their hearts again leap for joy. Next came the assignment of the labor which they had sworn not to do; nevertheless they receded from their vow, and quietly commenced. When all was suitably arranged, and I was about to withdraw, I cautioned the superintendent, in their hearing, not to work these men too hard, as they had been shut up in the county jail for several weeks, and were not used to the

scorching rays of the sun, and their hands were tender and not recently accustomed to the handling of rough tools, like our picks and shovels. I then stepped into my carriage and drove off. In the evening the superintendent reported that the day had passed off quietly, and that the work had progressed well. At the close of the day these convicts inquired of the others if this was the way they were treated all the time. They were answered in the affirmative, and assured that the warden would be as kind to them as a father. The next day being Sunday, I went in and inquired after the welfare of each convict. At length I came to the two in question, and spoke a few kind words to them. They commenced sobbing, which was followed by a flood of tears, and a voluntary confession of what they had said when in jail. They promised that I should have no trouble with them. Kindness had melted and subdued them. If men so hardened can be conquered by kindness, who shall be despaired of?

The second class consists of prisoners of mature age, who, under the baneful influence of liquor or momentary passion or sudden temptation, have, in an unguarded hour, committed some criminal act. Criminals of this class are frequently reclaimed, and are sometimes hired out, as those are who are immediately to be mentioned as belonging to the next class.

The third class includes the youth, who are not hardened in crime, nor have their hearts yet been seared so that they are not subjects of reform. To this class my attention has been particularly directed, and, as authorized by law, I frequently hire them out to a parent, brother, or friend. When application is made for a convict of this class, I must have three guarantees before hiring him out. I must be convinced first that the convict is safe from assault by persons who would seek revenge for past offenses; secondly, that the person offering to hire him may be safely intrusted with the execution of the sentence; and, thirdly, that the convict's word of honor can be confided in. If satisfied on all these points, I lay the matter before the board of directors. If they approve, the contract is entered into; if not, all remains in *statu quo*. One condition of the contract is that the employer shall suitably feed, clothe, guard, and meet all other charges that may be incurred in the execution of the sentence, and pay to the warden the amount set forth in the agreement. A second condition is that he shall see that the convict abide under the rules of the institution, as far as they may be applicable. A further condition is that the convict shall be returned on the order of the warden, without the necessity of assigning any reason therefor. All these stipulations and some others having been entered into, the employer is appointed deputy warden, and files a bond with security for the faithful performance of his duties in the execution of the sentence on the convict committed to his custody. Under this mode of procedure the convict is placed, so to speak, under the care of a father, brother, or friend, besides remaining still under the watchful protection of the warden, who has power to order him returned at pleasure.

Now for the practical working of this system. About four per cent. have proved recreant to their trust; ninety-six per cent. have been in a measure reclaimed; fully one-half have settled down to be good citizens; and the balance have passed off to parts to me unknown. Suffice it to say that not one of this class has been committed to my custody for a second offense.

Having said this much on the subject of discipline and reform, I now proceed to the preventive measures employed in Utah. First, our license law is nearly tantamount to prohibition, especially in small or thinly

inhabited settlements. Secondly, the Territory is subdivided into about one hundred and seventy wards, or precincts, nearly all of which have an organized female relief society, whose business it is to look after and supply the needs of the poor and the children that are not suitably cared for. These societies are exclusively managed by the ladies; all aid rendered is by voluntary donation. The higher aim of the society is to prevent children being brought up under demoralizing influences, and to direct the juveniles in the paths of virtue. Parents and guardians, not willing to accept the proffered aid, are free to take their own course, so far as the society is concerned. Thirdly, by an act passed by the legislative assembly in 1853, the probate court of each county is authorized (on complaint that there are in the county minor children who are not properly brought up) to issue an order to a proper officer requiring him to bring said child or children before the court, and summon the parents or guardian, as the case may be, to appear and show cause, if any they have, why said children should not be bound out to suitable persons under the provisions of the statute.

Most of the citizens of Utah are partial to large families; consequently there is not much trouble in procuring suitable places for children in the most respectable families, with little or no cost to the county.

The salutary effects of these preventive measures are visible in the streets of our cities by the absence of prostitutes walking, mincing, and tinkling as they go, designing to lead the unsuspecting youth from the path of virtue. As yet no female convict has been committed to my custody, nor to the custody of my predecessors in office.

V.—PROCEEDINGS AND DISCUSSIONS.

[Reported by Rev. William H. Tiffany.]

The proceedings of the first day consisted simply of what was done at the opening session, which has been already reported in a former part of these transactions.

SECOND DAY—MORNING SESSION.

WEDNESDAY, *January 22, 1873.*

The congress re-assembled at 10 a. m. in Raine's Hall.

In the absence of the president, the Rev. Dr. Bellows, of New York, one of the vice-presidents, called the meeting to order.

Prayer was offered by the Rev. Thomas K. Fessenden, of Connecticut.

Judge Walker, of Michigan, chairman of the business committee, moved that the congress hold two daily sessions, viz, from 10 to 3 in the morning, and from 7 to 9.30 in the evening. Carried.

The annual report of the standing committee on prison discipline was read by Dr. Wines, in the absence of Z. R. Brockway, of Michigan, chairman, detained by sickness. (For the report see page 331.)

The report of the standing committee on discharged prisoners was read by Mr. Allinson, of New Jersey, chairman. (For the report see page 336.)

Governor Seymour, who had assumed the chair during the reading of Mr. Brockway's paper, said he hoped that the report, able and satisfactory as it was in most respects, would not go out without some qualification. He feared that it favored restraint too strongly. There was a class of offenders, called "rotary men," appearing often before the courts and

in prison, who needed to be sharply dealt by; but he was afraid of police supervision. Virtue could not be made by coercion. He had an abiding belief that there was good in every man, and that this should be sought out, encouraged, and developed. The number of pardons granted by him during his four years' administration as governor of New York had been made matter of reproach. With him it was rather an occasion of gratulation and pride. He believed that very many reformatations had been thus effected. He had witnessed many touching instances of gratitude, and one which, though perfectly sincere, had an air somewhat ludicrous. He had extended clemency to a poor fellow who, in expressing his thanks for the favor, said: "Governor, I hope to be able to do as much for you some time." Another consideration: he thought there was too prevalent a desire to make our prisons not only self-supporting but sources of revenue, and that the report gave too much countenance to this feeling. He believed in making prisoners work and earn money; but he believed also in giving them a share in their earnings, and a pretty large share too. Labor so performed would be far more valuable to the prisoner, for it would be willing, cheerful, and hearty; and it would tend to beget a love for work and to form the habit of industry. What he wanted was the reformation of the criminal, and he believed that this would be better effected by kindly care than by excessive coercion and restraint. But he would not close without saying that, despite these criticisms, he regarded the report as an excellent one, and thought it contained many valuable suggestions.

Dr. Wines agreed, in the main, with what had fallen from the president, but thought he had attached too strong a meaning to some expressions in the report. He was quite sure that there was no man in this congress who felt more strongly for the prisoner, or acted more wisely on his behalf, than Mr. Brockway in the management of his prison at Detroit. As regarded police supervision after discharge, it was not much known in this country, and doubtless there was a strong feeling against it; but it was a question worthy of being studied. It was discussed in the London Congress. The continental delegates opposed it as harsh and injurious as practised among them, but approved of it where, as in England, it was of a friendly character and designed to shield and help the convict. When so practised, they thought it wholesome and beneficial. It was, however, applied in England only to "habitual criminals," whom Governor Seymour had described as "revolvers," and in reference to whom he had admitted that "restraint" might be salutary.

Mr. H. Thane Miller, of Ohio, heartily indorsed what the president had said, and thought the congress would do the same. The diamond sentiment of his address last night was, that criminals "needed a spirit to guide, and a Saviour to atone." That was true. The only hope for the criminal was in a change of heart; and therefore, officers having them in charge should be men of God. More care should be had in the instruction of convicts, in setting them good examples, and in pointing them to the Saviour and the Holy Spirit for salvation and sanctification. The reading of the convicts was also important. He believed in the idea expressed in Mr. Brockway's report, that there should be a compulsory law to have the children of the convict and all children sent to school.

As regarded the second report, read by Mr. Allinson, on discharged prisoners, he believed that great good would be accomplished by the practical application of its suggestions. Convicts must be helped when they come out of prison, not only with good advice, but money or its equivalent. They must be aided in getting work. More than fifty discharged from the Ohio state prison last year had had employment

furnished them, to the equal benefit of themselves and the community. He hoped that all would carry the spirit of that report to their homes.

Mr. Albree, of Pennsylvania, had visited Mr. Brockway's prison, and spoke of it in terms of warm commendation. He thought terms of imprisonment should be made longer, so that there might be time for reformation, and for the successive steps which that work required. Prisoners needed sympathy and love, and these should be shown in person, not by proxy. He was a director in the Allegheny County workhouse, of which Mr. H. Cordier was warden. The institution was started only a few years ago. It was conducted on reformatory principles, and promised great success.

Dr. Wright, of Tennessee, expressed warm approval of both reports, and thought the congress would indorse them.

Colonel Burr, of Ohio, did not desire to occupy the time of the congress. He only wished to say a word on one or two points. He had been in charge of a prison having an average of a thousand men, and knew something of the matters discussed here. The idea had been thrown out that officers looked down upon prisoners as a lower order of beings. This might be so in some cases, but it was different from his own experience and practice. He forgot that they were prisoners, and looked upon them as brothers. There was but one thing that would really and radically reform criminals, and that was the Christian religion, the regenerating power of the Holy Spirit, and salvation through the blood of Jesus. He thought that police supervision would not do in this country, nor had he much faith in the idea of indefinite sentences, as suggested in both reports. The great difficulty with discharged prisoners was the idea of their having been *convicts*. If they tried to conceal the fact, they were sure to be found out and *crushed*. Police supervision he thought would add to this load. Put some trust in the prisoner, and thus beget in him the desire to lead a better life; this will inspire hope and prompt effort to deserve your confidence.

Dr. Bellows, of New York, was sorry to see any conflict introduced here. He was much struck with the independence of Mr. Brockway. Independent men are men of strength. They often combine opposite traits, and are capable of high thought and great action. He regretted also to see a conflict between theory and practice. This was illogical and unnatural. All right practice is based on sound theory, and all just theory is the child of correct practice. A war between theory and practice was therefore an internecine war. Let us put heads and hearts and hands together, and make a perfect man. Another thing he was sorry to see, namely, a conflict between prison reformers and society at large, as if society was not in favor of true reform. Society was reformatory; and the whole prison system did not begin to compare in conservative and reformatory power with the great natural laws of society itself. Men were stayed up by public opinion, by a sense of decency, by the desire to stand well in the community, and the like.

Rev. Mr. Milligan, of Pennsylvania, was opposed to police supervision of discharged prisoners. What we wanted for prisoners as well as others, was the atonement of Christ and the spirit of love. He had helped a great many discharged prisoners, spending hundreds of dollars this way; and only one man, thus aided, had ever proved false to the trust reposed in him.

The Rev. Mr. Woodbury, of Rhode Island, read a paper by Dr. Clarke, of Massachusetts, who was unable to be present, on "The final cause of criminal legislation as affecting modes of punishment." (For this paper see p. 370.)

Dr. Wines, of New York, read a "Summary of the views and suggestions contained in the report for 1872 of the Board of Public Charities of Pennsylvania," sent by Mr. George W. Harrison, president of the board. (For this paper see p. 367.)

Dr. Wines said that one fact had struck him forcibly, viz, that all the four papers read this morning—Mr. Brockway's, Mr. Allinson's, Dr. Clarke's, and Mr. Harrison's—had contained approving references to the idea that criminals should not be restored to liberty till they gave evidence of being better fitted for citizenship than they were on entering the prison; and a paper would be read this evening, communicated by Dr. Despine, of France, which embodied the same sentiment. Dr. Despine went further, and expressed the opinion that when prisons became real reformatories, as this was their avowed aim, the incorporation of the principle of indefinite sentences in the penitentiary system would be an absolute necessity. All must admit that this principle was just; the only difficulty was in finding a right way to apply it. But he believed the problem capable of solution, for he held that God never made a truth into which he did not put a power which, sooner or later, would cause it to prevail. When the reformation of criminals was sought in *dead earnest*, difficulties would disappear, and our way would be made plain.

General Miner, of Missouri, expressed his opposition to the principles both of indefinite sentences and police supervision.

Mr. Hageman, of New Jersey, expressed concurrence in these views.

Mr. Richard Vaux, of Pennsylvania, advocated the same side of both these questions with the last two speakers. He had the greatest possible respect for Mr. Brockway. He was behind no man in admiration of his ability and success as a prison officer. Possibly his views might be applicable to the locality where he lived and worked. But what might be true in Michigan would not be true in Philadelphia or New York. Police supervision extended the prison beyond its walls. He would say, with entire respect, that New York had, in its prison at Sing Sing, a gigantic manufactory of crime. Criminals were there educated to go out and rob with greater skill and success. In the city of New York the rogues were stronger than the whole power exerted to keep them in subjection. Hence there was failure in the courts, judges and juries often conniving or winking at wrong. Mr. Brockway's plan would vastly increase the police force in New York, requiring a cordon of policemen around each block in the city. What was applicable in England would not be permitted in this country. The prolongation of the prison, after the prisoner has gone forth from its walls, would not be tolerated among us. The most important suggestion was that we hold out hope to the prisoner. Reform should be the end in view; and hope should be held out from the beginning.

Mr. Bradford, of Connecticut, said that he took square issue with the last speaker; he believed that we should have supervision of the discharged prisoner, if it was of the right kind. None could object to the continued supervision of a kind father after his son had left the paternal roof. This was the kind of supervision that discharged convicts needed.

Mr. Coates, of Pennsylvania, was against the idea of indefinite sentences, and denied the right of society to exercise supervision after the prisoner had served out his time.

The Rev. Mr. Fessenden, of Connecticut, read a report on the preventive, reformatory, and penal institutions in that State. (For this report, see p. 379.)

Dr. Wines read a report on the prison question in California, which

had been prepared and forwarded by the Rev. James Woodworth, secretary of the prison commission of that State, who was unable to attend in person. (For this paper, see p. 375.)

Dr. Bellows, of New York, asked for information as to the training of the girls mentioned in the report of Mr. Fessenden, whether the causes of crime in their cases were inquired into, and whether the treatment was specially adapted to each case. He spoke in strong commendation of Dr. Carpenter's essay on unconscious cerebration, and wished to ascertain whether the treatment of the girls referred to was based upon the truths contained in that book.

Mr. Fessenden explained that the points presented in the inquiry of Dr. Bellows were made matters of examination, and the treatment was controlled by the result. But they found that clean clothes, good water, and plenty of soap made a wonderful change. One of the girls, after she had shed her coat of filth, came out as handsome as a "picture." A police officer said to him of another of the girls, "If you can make anything of that girl, you can reform any one." Yet she is a good girl. Our success is very cheering in this work.

Mr. Janney, of Maryland, referring to statements made in the two reports read, said he rejoiced that temperance was making some progress. The fact that nine-tenths of the crime committed could be traced to intemperance, showed that effort should be made to promulgate the principles of temperance and to secure their general practical adoption. The offspring of intemperate parents, when they fell into crime, were more to be pitied than blamed.

Hon. Henry Barnard, of Connecticut, said that there was now organizing, in his State, a farm-school, based on the will of Mr. Watkinson, the funds for the support of which amounted to about \$100,000. Mr. Watkinson had also left a small sum to aid discharged prisoners. He quite agreed with the president (Governor Seymour) that a portion of the funds arising from the labor of the convicts should be set aside for their use when discharged.

Mr. White, of Pennsylvania, said that they had established a work-house, a few years ago, in Allegheny County, and that the earnings of the convicts had exceeded their expectations. They made oil-barrels. They gave three cents a barrel to the convicts, who made, on an average, twenty-two barrels a day. A man, committed for two years for petty offense, had earned \$250 for himself.

Colonel Burr, of Ohio, said that in his State they were authorized by the board of directors to place to the credit of each convict, as a reward for good conduct, such sum as they thought fit, not exceeding 10 per cent. of his earnings.

Mr. P. T. Miller, of Missouri, said that his experience as a prison officer had given him some knowledge of this matter. It was no argument to say that a bad man, because he was bad, should make no more money than a better man, because he was better. We should cultivate and encourage industrial skill as well as morality. We should change *coerced* into *free* labor. Money is mighty to move men even in a right direction.

Letters were here received from a number of penal, reformatory, and charitable institutions of Baltimore, inviting the members of the congress to visit such institutions during their stay in the city. The invitations were accepted with thanks.

A recess was taken till 7 o'clock p. m.

EVENING SESSION.

The congress re-assembled at 7 p. m.

The minutes of the previous meeting were read and approved.

The president, with complimentary remarks, introduced Miss Linda Gilbert, of Illinois, who gave an account of her extensive visitation of prisons in different States, in which she communicated a great amount of interesting statistical information. She said that 90 per cent. of all the prisoners in the country were more or less intemperate. The number of county jails in all the States was 2,197, and the average number of prisoners in each jail was about 8. The average number of prisoners in all the prisons in the country did not fall much, if any, below 40,000. Seventy-seven per cent. of the inmates of our prisons never learned a trade. Forty per cent. were illiterate. Thirty-eight per cent. lived out of the family relation, and had no home influences. She said that only parts of trades were usually learned in prisons; hardly anywhere was a full trade imparted. Some thought that criminals could not be reformed; but Mary Magdalene had seven devils cast out of her. There was much mechanical ingenuity shut up within prison walls. She knew of one prisoner whose skill had brought thousands of dollars into the treasury of the State. Her own special work had been to provide libraries for county jails, and she was now engaged in collecting books for the new jail of Saint Louis. Books were the photographed souls that have brightened, and yet brighten, the world. Her belief was that mercy should be mingled with justice, and reform with punishment.

Dr. Wines read a paper on "The Criminal," which had been communicated by Dr. Despine, of France. (For this paper, see page 338.)

Judge Walker, of Michigan, read a report on the preventive, reformatory, and penal institutions of his State. (For said report, see page 411.)

Hon. John F. Hageman, of New Jersey, read a similar report for that State. (For his report, see page 428.)

The president (Governor Seymour) said that the papers just read were now open for discussion. He declared himself in favor of providing discharged convicts with a certificate, engrossed on parchment, with seal, &c., attesting their good conduct during their term of imprisonment. He thought that such a testimonial would be a stimulus to a virtuous life. The first impulse of nearly all men is to turn away from the convict and leave him to his fate. But such a certificate might influence some to throw aside their prejudice, and to aid him in again becoming a good citizen.

Mr. Pierce, of Massachusetts, remarked that something had been said of the demoralizing influence of jails on boys and girls. Many had been struck with horror at seeing small children at such places, intermingled with hardened criminals, who took pleasure in corrupting them, and in preparing them to corrupt society on their release. They had a visiting agency established by law in Massachusetts. The agent and his assistants interested themselves in children charged with violating the law, aided them on trial, and secured them homes. Boys were restless, uneasy, fickle. They needed some friend to guide and guard them; some one whom they could call upon, and from whom they could obtain counsel and aid. It might be asked, How do these boys get to prison? He answered: By the lower courts, which hurried them off to jail, when only accused and not proved guilty of crime, and often not guilty in fact. There was some friction in the system, but it worked the best of

any plan yet devised. Some of the courts sought to break up the agency. But the people had confidence in it, and kept it in motion. It was doing great good.

Mr. Vaux, of Pennsylvania, commented on the paper of Dr. Despine, regarding it as marked by profound thought, keen analysis, and a thoroughly scientific cast, though he could not accept all its views, particularly the part relating to indefinite sentences.

Dr. Wines, of New York, concurred in the judgment just expressed of the ability and value of Dr. Despine's essay. He thought it contained seeds of thought which could not fail to spring up and bear, in the end, a rich harvest.

The congress adjourned till to-morrow at 10 a. m.

THIRD DAY—MORNING SESSION.

THURSDAY, *January 23, 1873.*

The congress met at 10 a. m., Governor Seymour presiding, and was opened with prayer by the Rev. Dr. Smith, of Maryland.

The minutes of yesterday were read and approved. Dr. Wines announced that, through funds proffered for this express purpose, the National Prison Association had been able to issue the complete works of Edward Livingston on criminal jurisprudence, and they offered these incomparable volumes to every person who, by an annual subscription of \$10, became a member of the association.

Dr. Bellows, of New York, said that this congress ought not to separate without an expression of its sense of obligation to that great man to whom penal science owed so much. He therefore moved, and the congress unanimously adopted, the following resolution:

Resolved, That prison science owes an inextinguishable debt of gratitude and commemoration to the great American expounder of the humane principles which have since been acknowledged as the true guide to reformers of penal law and administration; that Mr. Livingston, by his genius and moral elevation, anticipated by half a century the ideas which are now just beginning to prevail among students of criminal and penitentiary science; and that his work is a monument of learning, largeness of thought, nobility of feeling, and practical sagacity—an honor to the country of which he was so distinguished a citizen, and to humanity, to which he was so noble an example.

Governor Seymour said that the resolution of Dr. Bellows did no more than justice to Mr. Livingston in saying that he was the greatest man of our country in so far as penal science was concerned. He believed that he was also the foremost statesman that this country had produced. He had received a copy of an edition in French of Mr. Livingston's work, recently issued in Paris. He therefore moved, as additional to that of Dr. Bellows, the following resolution:

Resolved, That this congress learns with great satisfaction that M. Charles Lucas, a distinguished member of the Institute of France, has published, under the auspices of the Institute, an exposition of the penal code for Louisiana and for the United States, by Edward Livingston, and we are gratified that this work of our illustrious countryman is thus brought to the attention of European countries.

On motion of Dr. Wines, it was ordered that a committee of five be appointed to consider the expediency of making application to the Congress of the United States for aid to the National Prison Association, and to report to this convention.

The chair named for the committee Judge Walker, R. K. White, Edward Earle, Dr. Bellows, and Dr. Wines.

Dr. Bellows presented and read the annual report of the executive committee of the National Prison Association. (For this report see page 321.)

A paper on "Untried Prisoners," communicated to the congress by William J. Mullen, of Pennsylvania, was then read. (For this paper see page 362.)

The chair announced that the two papers just read were open for discussion.

Mr. Powell, of New York, desired to express the great pleasure which, in the main, he had felt in listening to the report read by Dr. Bellows. He, however, took exception to the moral value attached by the report to the dress of women. There was a vast amount of waste, and worse than waste, in this direction. He had lately seen a lady in Washington the flounces of whose dress alone cost \$1,000, and the rest of the dress corresponded in style and expensiveness. This matter of dress was becoming one of the strongest temptations to crime. He favored the dress of Quaker ladies, which was neat and economical, and instanced Elizabeth Fry and Lucretia Mott as illustrations.

Dr. Bellows accepted the criticism, saying that his remarks on the subject of dress were not in the report, but were thrown off extemporaneously in the reading. He took back all that he had said, except the principle underlying his remarks, which he believed to be just and true.

Governor Seymour hoped that the doctor would not surrender too much. He thought the principle involved a powerful means of cultivating and refining the sensibilities. We had better seek to quicken these in prisoners, rather than conquer or crush them.

Mr. Pritchard, of Kentucky, said that for three years past he had had opportunity to witness the working of prisons. They had a most objectionable system in Kentucky. One feature of the system was the leasing out not simply the labor of the prisoners, but the prisoners themselves, to contractors. The system placed the inmates of the prison completely under the control of the contractors. They worked the men for money only, and were sometimes harsh and merciless. Kentucky had lavished millions on other charities, but nothing on the improvement of prison discipline. They needed the warden system, so as to have matters under the control of the State and not that of contractors. He was willing to trust the people, the great mass of whom were right on this subject. With a warden at the head of the prison, and the discipline placed in his hands, they would escape some of the worst features of their present system. It was unwise for the States to *rent* the convicts. He offered a resolution on the subject, which was referred to the business committee.

Colonel Burr, of Ohio, expressed his thanks to Dr. Bellows for his report. We should not only keep alive the sensibilities of prisoners, but, what was kindred to that, we should exercise the spirit and power of kindness instead of mere force. All that Dr. Bellows had said had been verified over and over again in his experience and observation. He had a thousand prisoners under his charge, and his great source of power over them lay in the fact that he was their friend. A single and even a trivial act of kindness would produce great effect.

At this point Governor Seymour called the Hon. Mr. Vaux, of Pennsylvania, one of the vice-presidents, to the chair.

Colonel Burr continued: He said that where force had proved of scarcely any avail, a kind word had accomplished wonders. A Prussian

engraver had been in his prison; he was a very fine workman and much desired by counterfeiters, who would have given thousands of dollars to get him for their work. They provided him with means of escape, drills, &c., and \$5,000, and he readily succeeded, but was caught. He was placed in a cell and expected severe punishment. But when he (Colonel Burr) went to see him, he simply said, "Charlie, put on your coat and go to the shop, to work." The man started, surprised, and said, with tears in his eyes, "Warden, I did not expect this." He walked away, and turned again and said, "Warden, I will never try this again." Again he started, and after going a few paces he stopped a third time, and added, "Warden, you will never have any more trouble with me as long as I am with you." And he was true to his word. That man loved him to-day as one of his own children.

Dr. Wines, of New York, was afraid that the enthusiasm excited by the magnificent paper of Dr. Bellows would draw away the attention of the congress from the modest but very valuable paper of Mr. Mullen, read immediately after it. He hoped that that document would receive the attention which it so well deserved. It set forth, clearly and strongly, the duty of society to persons under arrest, but not yet brought to trial. It showed how much they stood in need of some friendly intervention, and how much suffering and wrong might be prevented by timely and judicious action on their behalf.

Mr. Merrefield, of Maryland, emphasized the remarks of Dr. Wines, and moved that Mr. Mullen's paper be referred to the business committee. Carried.

Mr. Rockwood, of Utah, agreed to all that had been said on the power of kindness. He had in his prison three of the worst "roughs" in that Territory. When first committed, they threatened vengeance, and declared their purpose to escape. He gave them bread and milk, with strawberries, for their breakfast, and took them out on the road to work. On leaving them he instructed the overseer not to work them too hard, as their hands were soft and would blister. The other prisoners told them that if they behaved well they would be kindly treated. Next Sunday morning they confessed that their intention had been to destroy their keepers and escape. Kindness had conquered them, and they wept like children. They had been, and continued to be, among the best men in the prison. He had found it important to separate the old from the young. Ninety per cent. of the prisoners were better men on their release than they had been on their commitment. That was his experience. Kindness gave power. Hope should be held out to prisoners.

Mr. Bigham, of Pennsylvania, said that under the leadership of the great founder, William Penn, his State had been a pioneer in prison discipline, and she intended to maintain her pre-eminence.

General Eggleston, of Mississippi, said that he was from the South, and wished to say a few words respecting that section of the country. He claimed that his State was in advance of some of the older States. She had forbidden the use of the lash in punishing prisoners. They had adopted the commutation system, shortening the term of imprisonment for good conduct three days each month. They had religious service, Sunday-school, a fine melodeon played by a convict, and excellent singers among the prisoners. They found music a power in moral training. On Christmas they gave the convicts an extra dinner, and full freedom within the prison premises to converse and amuse themselves as they pleased. They found no harm, but rather benefit, to be the result of this indulgence. On his release they took from the pris-

oner every mark of his convict service, gave him a complete outfit of clothing, and ten dollars in money.

A report from New Hampshire, by the Rev. Dr. Clark, was read. (See page 426.)

A report from South Carolina, prepared by General C. J. Stolbrand, was read by Judge Walker. (See page 447.)

The Rev. Mr. Woodbury, of Rhode Island, read a report from that State. (See page 440.)

Dr. Wines, of New York, read a paper contributed by Sir Walter Crofton, of England, on sundry points discussed at the Congress of London, with a view of correcting certain errors into which he considered members of that body had fallen regarding the state of things in his country. (See page 359.)

Dr. Wines said that it gave him pain to differ from a gentleman whom he so much respected, admired, and loved, both on account of his personal qualities and his great services to the cause of prison reform as he did with the author of that paper. Still, he could not accept his views on penal labor as an instrument of reformation, or the lash as a disciplinary punishment in prisons. These were the only points, he believed; certainly they were the principal ones, on which he dissented from the opinions of his distinguished friend, to whom the world is so much indebted for his labors in the cause of prison reform.

Mr. Powell, of New York, read a paper on "Intemperance and Crime." (See page 364.)

Mr. Pierce, of Massachusetts, said that the paper just read treated intemperance as the chief cause of criminality. But mere statistics would not show what produced crime. Intemperance was often an incident of low life. He referred to the separate system, the Crofton system, and the Maconochie system of prison discipline, and condemned them all as "weighed in the balance and found wanting." He did not come there to boast of his own State; there were things there that ought to be different; but the worst thing they had to contend with was the indifference of the people on this question of prison reform. The administration of county prisons in Massachusetts was very objectionable; you could not work into them any regular system.

Mr. Coates, of Pennsylvania, admitted that intemperance was not the only cause of crime, but it was one of the greatest, in his view the very greatest, of these causes, and should be distinctly so set forth. In this matter, he that was not with us was against us. Let no man tell him that they had not the power to crush this giant enemy to the order and welfare of society. They had the power if they would but use it. He appealed, in conclusion, to the members of the congress, as men and as Christians, to aid in the suppression of this great evil.

Mr. Vaux, of Pennsylvania, said that he fully indorsed the views of the gentleman from Massachusetts (Mr. Pierce) on this subject. He did not believe that intemperance was *the great cause* of crime; there were others greater. He objected to sweeping accusations. The worst murder in New York, that of the policy-dealer, was not caused by intemperance; and so in the Stokes case. He hoped temperance would succeed, and he would do what he could to help its success; but, said he, let us be wise, and not by the mere use of terms, by dreams, increase the catalogue of crimes.

Mr. Folger, of New Hampshire, said that the rule laid down by the Savior was, "by their fruits ye shall know them." It was by that rule that intemperance should be judged in its relation to crime. He was glad the question had been brought before us. He was sorry it had been ignored at London. Despite the silence maintained there, the

governor of an English prison had informed him that drink brought most of his prisoners there. As to what had been stigmatized as *police espionage*, we might judge that by its fruits also. It had been tried and worked well in England. So it might be in this country. There it was a kind care, and not an *espionage* at all.

Dr. Parish, of Pennsylvania, had desired to hear the paper on intemperance, but had not been in at the reading. He concurred in the views of Mr. Vaux. He once asked the chaplain of the Eastern penitentiary how many inebriates they had there. He replied, "not one; inebriates are not the kind of persons who become convicts." He protested against the use of sweeping declarations—against ultraism. Drunkenness was not, *per se*, a crime.

Mr. Powell, of New York, replying to Dr. Parish, said that he had visited the Eastern penitentiary, and was informed by the warden that nine-tenths of the inmates had been addicted to the use of intoxicating liquors. As to the murderer, Foster, it was in evidence that he had spent the evening in drinking, and Stokes was of the same character; he had been assured that he was under the influence of liquor when he committed the act. The paper he had read did not undertake to fix the status of drunkenness; the laws and the courts had done that.

The Rev. Mr. Woodbury, of Rhode Island, said that we were very apt to consider things that seemed to be connected as cause and effect. We might possibly err in this. None of us would consider drunkenness as a crime of *itself*; but we all agreed that intemperance and intoxication were indicative of a want of self-control, in which state all crimes became possible; and a lack or neglect of possible self-control was sin. The appetite for drink was sometimes inherited; and the desire for gratification came upon its subjects periodically, say, every six or twelve months, and was then uncontrollable. He once roomed in a theological school with a young gentleman whose appetite came upon him so strongly that he shut himself up for several days and secretly indulged in drink. And then, after an interval of soberness, he would have another surrender of himself to drink. The *habit* of intemperance was formed by indulgence, not inherited, or caused by disease. This habit was indicative of a want of self-command, a lack of full manhood, that we should endeavor to develop and strengthen. Persons without this self-command were often shown by facts and confession to have been suddenly assailed with temptation, without any previous intention, to commit crime. Convicts very frequently stated that they had no thought of doing the wrong until they became intoxicated.

Recess until 7 o'clock p. m.

EVENING SESSION.

The congress re-assembled at the appointed hour, Governor Seymour in the chair.

Mr. Develin, of New York, read a paper on the susceptibility of criminals to reformatory influences, communicated by Dr. Anderson, president of the New York Catholic Protectory, who was unable to be present himself. (For Dr. Anderson's paper see page 359.)

Dr. Wines said that it would be impossible for him to present his annual report in full, unless the congress was prepared to devote a day to hearing it read. As this evening was to be given up to a consideration of reformatory work, he would read what his report contained on the reformatory system of Great Britain. (See Part I of his report, pp. 116-122.)

Dr. Wines read a communication from Mr. Demetz, founder and director of the penitentiary colony of Mettray, France, on the preparatory school, connected with the colony, for the training of sub-officers to be employed in the institution. (For the letter of Mr. Demetz, see page 358.)

The Rev. Mr. Woodbury, of Rhode Island, read an exceedingly interesting paper on preventive and reformatory work in Massachusetts, prepared by Mr. F. B. Sanborn, a member of the board of public charities in that State. (For Mr. Sanborn's paper see page 400.)

Mr. Develin then addressed the congress in regard to the Catholic Protectory of New York City. He said that the institution was founded and commenced operations in 1863. It had since aided 7,000 children. The present number of inmates was 1,250, 360 of whom were girls. It was in no sense a prison, with bars and massive walls to encompass the children, but an institution where the children were made to feel that the managers and officers were their true friends, and where the rule was maintained almost wholly by moral forces. The boys all learned trades, becoming typesetters, stereotypers, machinists, shoe-makers, tailors, carpenters, chair-makers, bakers, farmers, and gardeners. An account was kept with each boy and girl in the institution. The officers were careful to inculcate the idea that labor is a duty, and that it is ennobling, not degrading. They allowed inmates so much per month or week, according to their diligence. One boy had earned enough to bring his mother, three brothers, and a sister from Ireland to this country. Another had saved and invested \$300 in land near the school, and the indications were that by the time the lad had reached his majority, his investment would yield him sufficient capital to enable him to start in business. Many other boys in the school had accumulated larger or smaller sums of money by their industry. In the shoe-making business, the institution was a small Lynn. The boys did jobs of printing for people outside, and the same with other trades carried on in the protectory. They had pigeon-holes, into which were put checks or tokens of good conduct; and the scholars, according to the number of these tokens, received small gifts; to the younger children were given toys; to the older, money. They allowed the well-behaved to roam in the adjoining woods, to bathe in the river, to row in boats, and to fish. In this way they endeavored to show the boys that they were their friends. They endeavored to bend the twig aright, so that when the boy became a man, he would prove a good and useful citizen. The boys felt that their institution was a home. The protectory was a Roman Catholic institution, but it received Protestant boys and girls, and no restriction was placed upon their attending Protestant churches and Sunday schools, nor were any attempts made to induce them to embrace the Catholic faith.

Mr. Develin said that there were more causes than one for congratulation on the meeting of this congress, but a principal cause was the common ground on which we could all stand, compare views, and work in harmony. It had been so in the Cincinnati and London congresses, and it was so in this. Dr. Wines, an eminent American Protestant, and Dr. Manning, an eminent Catholic prelate of England, united in the one great and noble work of assisting the prisoner in his efforts to reform. We had hoped for the presence of the Catholic archbishop of this city, who had been invited to open one of the sessions of this congress with prayer; but he had been prevented by sickness, which had caused him to seek a healthier clime.

Mr. Develin closed by inviting the members of the congress to visit

the protectory. If they would come to the office, No. 29 Reade street, they would be conveyed to the institution by carriages.

Mr. Pritchard, of Kentucky, in consideration of his being obliged to leave the city to-night, asked that the discussion on reformatory institutions might be suspended at this point to enable him to introduce, and the congress to pass, a resolution condemning the system of leasing prisons to contractors. It was a question in which he felt a very deep interest, and he would be glad to be present when it was discussed. It was explained by the president that when the subject came up for consideration to-morrow, the colleagues of Mr. Pritchard would be present, and would, no doubt, represent the public opinion of Kentucky on this subject. After further conversation, Mr. Pritchard withdrew his request, and the discussion on reformatories was resumed.

Mr. Talcott, of Rhode Island, said that he was from a small State, and was at the head of one of the smallest institutions for reform in the country. The work was a great one, and how to do it wisely and well was the question. To learn this he had come here; and while willing to give his own views, he hoped to hear from others who had had greater experience. He had two hundred children and youths in his institution, and thirty more placed in families in different parts of the State, whose names were on the roll. They were boarded out at \$2 a week, and must be reported upon at least monthly. From one to two dollars a week were paid for their education. If the children staid three or four months in a family, arrangements were made for continuing them there. The discipline of the institution was parental, as much so as they knew how to make it. Some correction was occasionally necessary, and a little chastisement, administered in a right spirit, had a good effect. The special feature of the institution was that of a family-home.

The Rev. Father Quinn, of New York, asked: "Do you have walls surrounding your reformatory?"

Mr. Talcott replied that they had.

Father Quinn. "Is there any special feature in your institution wherein it differs from other reformatories?"

Mr. Talcott. "No, it is very much like other institutions, having the same end in view."

Rev. Mr. Sheldon, of New Jersey, superintendent of the reform school for boys at Jamesburgh, said that their plan embodied the family system as far as possible. Boys were sent to them up to twenty-one years of age. They had power to release any inmate at the end of a year, if they judged it expedient. They sought to infuse the stimulus of hope into the minds of the boys. They had no encircling wall. They sought to get into the heart of the boy; they sympathized with him in his troubles, and so endeavored to hold him by the power of kindness. For the encouragement of fellow-laborers in this work, he would say that kindness had wrought wonders for them. It was the great power with which to mold these young hearts to virtue. It won their confidence and restored their self-respect, both of which were great elements in effecting their reformation.

Mr. Shipley, of Ohio, thought that prevention was the great thing. He believed in compulsory education as an effective means to this end. There were parents who would not educate their children, but would sooner train them for crime and ruin. They had a law in Ohio by which they could take a child away from such parents, to the benefit of society and the salvation of the child.

Judge Walker, of Michigan, asked: "How long have you had this law, and what have been its results?"

Mr. Shipley answered: "We have had the law four years, and it has worked well; many children have been rescued and placed in good homes with farmers."

Judge WALKER: "Can children be taken away from parents without their consent?"

Mr. SHIPLEY: "Yes. Our institution is 'the house of refuge' for those worse than orphan children."

Mr. Milligan, of Western Pennsylvania, said that they had adopted in their prison almost all the reformatory measures that had been advocated in this congress, and they looked forward to a bright future of successful reformatory work. But he would like to hear discussed in this congress the criminal codes of the several States and their administration. He believed that there was more crime produced by defective laws and bad administration than was prevented or punished by them. Criminal laws and courts seemed to him a mighty machine for the manufacture of criminals. He favored indefinite sentences and graded prisons. Would they turn a person infected with the small-pox loose to spread the contagion? That seemed to him quite as reasonable as it would be to release a prisoner infected with the leprosy of crime, which was worse than that of small-pox.

Mr. Ames, of Massachusetts, desired to emphasize the views expressed by Mr. Shipley in favor of preventive measures. They had a law in Massachusetts like that of Ohio, by which children exposed to want and in danger of falling into crime could be taken from their parents, and thus preserved from matured criminality. That was prevention, which was better than cure. The lovers of humanity should awake and put forth every effort to save the crowds rushing to ruin, young women especially. Seventy-five per cent. of those rescued by this law from the criminal example and teaching of their parents, and from association with the vile, were saved. They should retain a supervision over such during their minority, kindly watching over them, getting them into good family-homes, and thus preparing them for the highest position that woman could occupy—that of wife and mother. He might be an enthusiast, but he believed that hundreds and thousands of girls, now just commencing a course of crime and infamy, might be saved. A far greater number of institutions than now existed should be established in every State, both preventive and reformatory.

Mr. Rockwood, of Utah, said that in 1853 an act was passed in that Territory, authorizing the probate judge to take any child, on presentation of proper evidence that it needed care, and bind it out, at the discretion of the court. He had known children who had been thus saved as brands from the burning. They could also bind out juvenile offenders that were found drunk on the streets; if claimed by responsible persons, they were surrendered; but if there were no such to care for them, they bound them out.

Dr. Wright, of Tennessee, read a report on the penitentiary system of his State. (For his report see p. 449.)

No report having been sent in from Missouri, General Miner and Mr. Miller submitted a report prepared during the sessions of the congress, which, without being read, was placed on file. (For this report see p. 424.)

General Miner, on behalf of the Missouri delegation, invited the congress to hold its next meeting in Saint Louis, and assured them of a hearty welcome.

Adjourned till 10 to-morrow morning.

FOURTH DAY—MORNING SESSION.

FRIDAY, *January 24, 1873.*

The congress re-assembled at 10 a. m., pursuant to adjournment.

In the absence of the president, Judge Walker, of Michigan, one of the vice-presidents, on invitation, took the chair.

The Rev. J. L. Milligan, of Pennsylvania, opened the session with prayer.

Mr. Miller, of Missouri, renewed the invitation to the congress to hold its next meeting in Saint Louis, repeating the assurance of cordial welcome by the city and the State, and adding, "You need to see our people and our city; and we need to see and hear you, to receive the lessons you will give us, and to feel the quickening of your presence."

On motion, the invitation was accepted, with thanks. Subsequently in the day, a telegram was read from the Hon. Joseph Brown, mayor of Saint Louis, repeating the invitation, and promising the congress the heartiest of Missouri welcomes, which was received with much applause.

Dr. Wines stated that the board of directors of the National Prison Association, at a meeting held in this city yesterday, had resolved to have these annual congresses in the spring, during the month of May or June, the exact date to be fixed according to circumstances, by the board, or its executive committee, and that the next meeting would, as a matter of course, take place in the spring of 1874.

Dr. Wines further stated that the constitution of the national association provided that committees of correspondence should be formed in all the States at the earliest practicable moment, to co-operate with the association in pushing the work of prison reform in all its departments, but especially in the gathering of criminal, penitentiary, and reformatory statistics, and that he had been instructed by the board of directors to invite the delegations from the several States to hand in to him the names of such persons as they judged competent and suitable to be placed upon the proposed committees. He further said that it was the judgment of the board that where boards of State charities or prison associations exist, instead of forming new organizations they should be invited to co-operate with the national association in the manner and for the purpose indicated.

On motion, it was ordered that the further reading of reports from States be dispensed with, and that reports not hitherto read be referred to the executive committee of the association for publication, either in full or epitomized form, in the transactions of this congress.

Dr. Wines read a paper by Miss Carpenter, of England, on life-sentenced prisoners, at the conclusion of which he said that he much regretted that the pressure of business on this last day of the sessions of the congress was such as to forbid an extended consideration of the very important question treated by Miss Carpenter. The paper was able and suggestive, like everything that came from the pen of that distinguished philanthropist and writer. It presented many very striking views, and though there was no time at present to consider and discuss them, the essay would be printed as a part of the proceedings, and would be as seed cast into the public mind and thought of the country and the world. (For Miss Carpenter's paper see page 348.)

Mr. Shipley, of Ohio, chairman of the finance committee, and treasurer of the congress, reported that \$244 had been received, that all bills had been paid, and that there remained a surplus of \$73.85. On motion of Mr. Griffith, of Maryland, it was ordered that the balance in the hands of treasurer be appropriated to the National Prison Association,

and it was accordingly handed over to the secretary, for transmission to the treasurer of the association.

In the absence of Mr. Monfort and the other secretaries of the congress, General James L. Miner, of Missouri, was, by vote of the congress, invited to act as secretary in their place.

Dr. Wines, on behalf of the special committee appointed to consider the expediency of petitioning Congress to make an appropriation in aid of the work of the National Prison Association, reported the draught of a memorial addressed to that body.

General Eggleston, of Mississippi, and Mr. Vaux, of Pennsylvania, doubted the propriety of the action proposed.

Governor Seymour, of New York, said that he was what was called a "States' rights" man, and that upon that point he agreed with the gentlemen who had preceded him. But there was one aspect of this case which took it out of the scope of their criticisms. The movement in which we were engaged was national, and even international. We were in fact a part of the congress which met in London last year. We acted, therefore, in a national relation. Criminal administration and prison discipline belonged to the National Government, as well as to the governments of the States, for the United States, equally with the individual States, had its courts and its convicts. Besides, the District of Columbia and the Territories were within our purview, and these were under the immediate jurisdiction of the National Government. And then, as he had said, this work was international, as well as national. The London Congress formed a permanent international commission, charged with the duty of organizing a plan for the collection of international penitentiary statistics upon common principles, and according to common formulas; and it was expected that all nations would co-operate in this work. Would the United States Government alone stand aloof from it? He thought that the Government should not and would not decline co operation in an object at once so catholic and so important.

The discussion was continued for some time, a number of delegates taking part therein.

Governor Seymour resumed the chair, and Judge Walker moved that the report of the committee be adopted; that the president and secretary be authorized to sign the memorial; and that a committee of thirteen, of which the president should be chairman, be appointed to present the memorial to Congress.

The motion passed, and the following gentlemen were appointed on the committee: Hon. Horatio Seymour, of New York, chairman; Hon. Richard Vaux, of Pennsylvania; General J. L. Miner, of Missouri; General B. B. Eggleston, of Mississippi; Hon. C. I. Walker, of Michigan; Governor F. Smyth, of New Hampshire; Hon. Edward Earle, of Massachusetts; Hon. R. K. White, of Kentucky; Hon. Isaac D. Jones, of Maryland; Murray Shipley, Esq., of Ohio; Professor W. F. Phelps, of Minnesota; Rev. H. W. Bellows, D. D., of New York; and Dr. E. C. Wines, of New York.

Mrs. Richardson, of Missouri, through Judge Walker, offered the following resolution, which was unanimously carried, viz:

Resolved, That the friends of prison reform be earnestly invited to show their interest in the cause by becoming members of the National Prison Association, and thus promote its usefulness and at the same time aid in the circulation of the works of that great statesman, jurist, and prison reformer, Edward Livingston.

Mrs. Richardson sent up \$10 to constitute herself a member of the association, thus proving her faith by her works.

Judge Walker, of the business committee, reported six resolutions on points which had been, in some form, referred to the said committee.

For these propositions see further on, under the heading "Resolutions adopted by the congress."

The first resolution, relating to the connection between intemperance and crime, the subject having been fully discussed yesterday, was carried unanimously.

The second resolution, relating to the leasing of prisons, gave rise to an extended discussion.

General Eggleston, of Mississippi, said that the "leasing system" prevailed in his State, but worked badly. They found themselves imposed upon by the lessees. The men were overworked. There was constant friction between the State authorities and the lessees. The authorities insisted that the men should have wholesome and sufficient rations, and be suitably clad, kindly treated, and not overtasked. The lessees complained that such interference curtailed their profits, and would compel them to surrender their contract. He thought that when their new prison building was completed and they had room for all their convicts to work within the prison premises, the system would be definitely abandoned.

Dr. Wright, of Tennessee, defended the system, as practised in his State. They retained control of the discipline and management of the prison. They did not for a moment lose sight of the interests of the convicts, whose reformation they earnestly sought.

Mr. South, of Kentucky, said that he did not quite agree with the views of his colleague, Mr. Pritchard. He defended the system in part, and commended the humanity of the late lessee, Captain Todd.

Judge Walker, of Michigan, said that there seemed to be some difficulty or misunderstanding, which he thought grew out of the term "leasing." He thought the word "contracting" would be preferable. There was a prejudice against leasing, but in all the States there was something of the contract principle and practice. The term "leasing" conveyed different ideas to different minds.

Governor Seymour supposed leasing and contracting to be very much the same thing.

Dr. Wines, of New York, said that, with all deference to the two eminent gentlemen who had last addressed the congress, he conceived that there was a material difference between the leasing system and the contract system, and, although he did not like the latter, he considered the former greatly more objectionable. Under the contract system, the labor only of the convict was hired out; while the whole care of the prisoners, the discipline, the clothing, the bedding, the food, the medical attendance, the religious and secular instruction, the hours of labor, &c., were retained in the hands of the authorities. But, under the leasing system, all this was changed. The whole control and management of the prison, including the material and moral interests of the prisoners, were turned over to the lessee, who was sometimes an individual and sometimes a business company; but always a party whose sole object was to grow rich, first out of what the convicts could earn, and next out of what could be saved from the cost of feeding, clothing, and housing them. The prison was let, as he understood it, for a term of years, to the party who offered the highest bonus to the State, over and above the keep and care of the prisoners. Other considerations might possibly come in, but this was the main and controlling one. He

looked upon it as a system objectionable to the last degree. It was the same system against which John Howard, a hundred years ago, lifted up his voice and employed his pen. That was the English system of his day. He had had some opportunity of learning the state of public opinion in some of the States where the system had been tried in this country. He first met the system in Illinois in 1865, where he found public sentiment unanimous, or nearly so, against it; and a year or two later it was crushed out. He next went to Missouri, where the system had previously existed, but public opinion had destroyed it. He then passed over to Kentucky, where the system was then and is still in vogue. But even there those most closely connected with it—the prison inspectors, for example—were against it. One of them pronounced it, in his judgment, the worst system that human ingenuity could devise. He admitted, and was glad to admit, that Captain Todd, who was at that time the lessee, was a humane and just man, and he had proved his disinterestedness, as well as the breadth of his views and the elevation of his character, by advocating a policy which no doubt would have taken thousands of dollars annually out of his pocket, that is to say, the creation of a prison for juvenile offenders, which would have removed fifty to a hundred young men from his institution, and deprived him of the profit of their labor. He believed that Captain Todd had acted justly and honorably by the convicts, but the account he had received of the conduct of previous lessees—some, not all—was quite different. It was the *principle* of the plan to which he objected. It was too liable to abuse, and the temptation to abuse was too strong. In the millennium it might do, if there were any prisons then; but in the present condition of human nature, he believed the system radically and incurably vicious.

Mr. White, of Kentucky, agreed with Dr. Wines. He did not ask the congress to pass judgment upon his State, but he wanted to settle a principle of prison treatment. Indiana had once tried this system; but she found that while it enriched the contractor it robbed the people and demoralized the prisoner.

Colonel Burr, of Ohio, said that though they contracted the labor of their prisoners, they retained complete control of them. A contractor could not even *speak* to a prisoner, except to tell him what to do, and he (Colonel B.) had the power, on the least interference of a contractor, to dismiss him and forbid his return to the prison; and more than once he had exercised that power. But leasing a penitentiary, with the power of control over the convicts vested in the lessee, was a different matter. That was going back to the dark ages of prison discipline.

The Rev. Mr. Woodbury, of Rhode Island, said that public opinion controlled prison systems as it did everything else. As a congress we could only suggest reforms and then leave the States to decide for themselves.

Dr. Wines asked Mr. Woodbury whether the contractor in the Rhode Island prison did not agree to employ discharged convicts in his factory outside.

Mr. Woodbury replied that there was no stipulation of that kind in the contract; but there was an understanding to that effect and an obligation of honor for them to do so.

Colonel Burr said that this was, to a considerable extent, the case in Ohio.

Mr. Miller, of Missouri, expressed his detestation of the leasing system where the lessee had control of the prisoners. Where the State had control it was better; but he would prefer to have the State work

the men. It might do so through a competent agent as well as a contractor could. Mere money-making should not be a consideration. It was wrong to put prisoners into the hands of men whose sole aim was to enrich themselves out of their toil. It was the worst kind of slavery.

Mr. Woodbury said that a practical difficulty would be the capital. Where should that be obtained?

Mr. Griffith, of Maryland, without at all favoring the system of leasing, claimed that that of letting the labor on contract worked well in the Maryland penitentiary. The board had entire control.

The resolution was then adopted.

Judge Walker read the third resolution, relating to accused but untried prisoners; and the fourth relating to the aiding of discharged convicts, which were considered together.

The Rev. Mr. Doll, of Maryland, agent of the Prisoners' Aid Society, said that his society did something in the way of looking after the arrested, as well as in aid of those released from prison. Their association was but three years old, yet 581 prisoners had been discharged by the courts through his intervention. The facts collected by his investigations had convinced the judges either that they were innocent or that the charges against them were too trivial for grave, judicial proceedings. Eleven hundred and sixty-five had been aided with money; three hundred and forty-nine had had steady places provided for them, and two hundred and eighty-eight had been furnished with temporary employment. His own house had been for the last twelve months turned into a refuge for discharged female prisoners, and he would soon have to ask the people of Baltimore to provide a home for such, for the number was becoming too great for his limited accommodations. God had given him a large-hearted, noble helpmate in his wife. Fifteen poor creatures were then in his house, who but a short time ago were within the walls of the penitentiary. Fourteen of them were colored girls. And these poor creatures had made his house a *banking house* for their savings. He begged pardon for his warmth in this matter. I feel (said he) that I have a greater responsibility resting upon me than when I was ordained by the bishop, in the Methodist Episcopal Church, to what would be called a higher order of the ministry. O! sir, we want a *prison* ministry. I say to my brethren in the ministry, we must come down from our pulpits and minister to them that are in prison. A poor girl rescued from the whirlpool of prostitution and received into our home until we found her a place of employment has visited us a dozen times since, bringing small presents to testify her gratitude. She has recently been restored to her father's house, in Virginia. No prisoners' aid association is complete without a prison agent connected with it. We took charge of three poor girls a short time since that but for our aid society would have speedily rushed to ruin. Now they are saved, and are in membership with the church. We are but doing the Master's work when we thus *go down* and seek to save the lost. Mr. President, I suppose that my time is very limited; but I wish to use it all in pleading especially for the poor children needing our sympathy and aid. For them I could stand and plead until the going down of the sun.

Mr. Merrefield said that prison reform in Baltimore owed much to Mrs. Doll for the success attained through the labors of her husband.

Mr. Griffith related several telling incidents connected with this work in Baltimore. He said that the most faithful porter he ever had in his store was a discharged convict.

The resolutions were carried.

Judge Walker next read the fifth resolution, relating to the necessity of vigorous effort to improve the administration of existing prison systems.

In doing so, he said that the States did not, as a general thing, pay salary enough to secure and retain good men as wardens and keepers. The very best men were needed for the duties required.

The Rev. Mr. Milligan, of Pennsylvania, thought the resolution a very wise one. The idea was not to interfere with special systems, but to stir up all to work, on their own plans, in the best and most effective manner.

Mr. Coates, of Pennsylvania, said that that was the true idea. Let each follow his own chosen and well considered way, and "by their fruits shall ye know them."

The resolution was adopted.

Recess until 7 p. m.

EVENING SESSION.

The congress re-assembled at the hour named, Mr. Vaux in the chair.

Judge Walker read a letter from Alfred H. Love, of Philadelphia, apologizing for his absence from the meeting, expressing his sympathy in its objects, and giving his views at some length on the subject of prison discipline. (For Mr. Love's paper see page 374.)

Dr. Wines submitted a similar though shorter letter from Dr. Aiken, of Wilmington, Delaware, apologizing for his absence. He had lost his wife, and the funeral took place during the meeting of the congress.

Dr. Wines also read a short letter from Rev. C. C. Foote, late chaplain of the Detroit House of Correction. (For Mr. Foote's letter see page 374.)

He further submitted a letter received sometime ago from Hon. B. F. Butler. (For said letter see p. 369.)

Governor Seymour took the chair at this point, and announced the committee of thirteen on the memorial to be presented to Congress. The names of the gentlemen constituting the committee have already been given.

Judge Walker read the sixth resolution, relating to reformatories.

Dr. Hatch, of Connecticut, said that we had the boys, and the question was, What kind of citizens shall they be? We needed good citizens, and such came from good homes. He approved of compulsory education, and hoped for its general adoption. If the children were rightly educated, we would not need either penal or reformatory institutions. He questioned the necessity of such a resolution; it was but the alphabet; we were beyond that. Let us have warm hearts to receive the children kindly. Of course we would pass the resolution; but we were already getting beyond it.

Dr. Wines reminded Dr. Hatch that if Connecticut was beyond it, Texas was not; nor Arkansas; nor Oregon; nor a half score of other States.

Mr. Bigham, of Western Pennsylvania, said that since the Cincinnati Congress they had been considering the question of changing their institution—the Western House of Refuge—and had concluded to adopt the family plan instead of the congregate, formerly in use. They were going out some miles into the country. It would take them two years, probably, to complete their new buildings, and then they meant to have the model reform school of the country.

Mr. Coates favored teaching these boys trades. Skilled workmen

were becoming scarce, and were greatly needed. The reformatories might aid in supplying this want.

Mr. Shipley, of Ohio, said that the members of the convention sometimes lost sight of the main point. It was not so much, how can we cure the convicts and have them become good men, as how can we prevent the children from becoming convicts? Compulsory education was good, but it alone would not keep boys from growing up into criminals. We must adapt our schools to the circumstances and wants of the children. There were a great many agencies. Among them he was pleased to see the feature in the New York Catholic Protectory, referred to by Mr. Develin, that of giving rewards to little boys. He admired that plan. They had established a school in Cincinnati, and they provided a warm dinner for the needy children that attended it. They took 150 children from the street, and fed, taught, and saved them. They had their private visitor, whose business it was to find and bring them to the school; and after they had interested them in learning, they transferred them, if possible, to the public schools. They tried to act on the principle of the patriarch Job: "The cause which I knew not, I searched out."

Mr. Vaux, of Pennsylvania, believed that the old Greeks used to pray that the gods would endow us with the eloquence of silence. He felt the need of that prayer. He had been appealed to, quoted, unkindly criticised, and kindly laughed at, by some of the members of that congress. He had tried to bear it all as well as he could, and kept on praying as did the Greeks. But the time had come when it became necessary for him to say a single word in defense of his views. It had been said, "there is no partisanship in what is spoken here. We are all met to devise means to advance the cause of reform." However that might be, he would say, *God bless the work*. They should lay down *general principles*, and not go too much into particular measures. Some had praised Christianity. That was right; but they had given a slap at the individual system of treating convicts.

The Pennsylvania system had been discussed, while it was not understood by five gentlemen out of the State. The phrase "*solitary confinement*" had been used and applied to it. Miss Gilbert so characterized it, and asked, "Would you hang a Christian?" Yes, he would hang *forty* "Christians," if they broke the law and were found guilty. The Pennsylvania system should be spoken of as the separate or individual system. Howard did not commence visiting British prisons until long after Pennsylvania had reformed abuses in the indiscriminate, or rather *no* system, which then prevailed. To Pennsylvania belonged the praise of moving first in this reform. The best paper read in that congress on the prison question was that of Dr. Despine, of France. Until you elevate this reform to a science, you are running after vagaries. You must study and know the criminal himself. Such knowledge was the basis of all right prison treatment. You cannot reform criminals by merely putting them into prison, nor prevent crime by putting boys into reformatories. You must find out what are the causes, and adapt your treatment to *them*. That is the problem; that strikes at the root of the matter. All else is but playing with the surface. You must look at principles, not mere details. You must look at the question as statesmen, not as politicians. Politics must be eliminated from prisons and prison management.

The president asked Mr. Vaux whether in Pennsylvania the prisoners were kept separate, or were allowed to receive visits.

Mr. Vaux said that they were separated from each other, but not from the world.

The Rev. Mr. Bradford, of Connecticut, said that the great question was how to care for the young in the reformatory, how to save them from becoming criminals. They should take care of the girls in peril of falling. Save them, and society was saved. They had in Connecticut the model school. They were ahead of Massachusetts. They had had remarkable instances of reformation, of which he gave several interesting illustrations. They had no bars and bolts more than in private houses. As regarded labor, the girls were engaged in making paper boxes, and ten per cent. of the money earned belonged to themselves. Some had saved \$75 or \$100. This was a great stimulus; it put hope into them, without which none of us could accomplish much.

The resolution was then agreed to unanimously.

On motion, the cordial thanks of the congress were tendered to the Prisoners' Aid Association of Maryland for the abundant labor expended in preparation for this meeting; to the citizens of Baltimore, for courtesies and hospitalities; to the band of the House of Refuge for the excellent music with which they entertained the congress at its opening session; to Mr. Raine for a liberal reduction on the rent of his beautiful and commodious hall; to railroad companies and proprietors of hotels for reduction of fares and board; to the reporters of the associated press and the Baltimore journals for their services in making known the doings of the congress; to the Rev. Wm. H. Tiffany, who kindly rendered his service as official reporter to the body without charge; to the Young Men's Christian Association and the managers of the numerous penal, reformatory, and charitable institutions of Baltimore and vicinity for invitations to visit and inspect the establishments under their care; and to the Hon. Michael C. Kerr, a member of the Congress of the United States from the State of Indiana, and of this body by appointment of the executive of that State, for his eloquent and instructive address, delivered on the evening of the 21st instant.

Dr. Wines moved the following:

This congress, while expressing its gratitude for the valuable reports and papers furnished by writers, at home and abroad, cannot assume responsibility for every sentiment and utterance contained in them. It holds itself responsible only for the principles and acts sanctioned by a formal vote.

Dr. Hatch rose and said: The business of this congress is concluded. I hope we shall now, for a few moments, resolve ourselves into a mutual admiration society, have a good time, and shake hands all round. I love sharp men, [looking at Mr. Vaux;] they bring out points more distinctly.

Mr. Vaux reciprocated the kindly feeling.

Dr. Hatch continued: We shall go home refreshed, prepared to work with warmer hearts and a more earnest zeal. We are satisfied that the great thing is, to have the right kind of men in charge of our prisons and reformatories. It is not the separate, or the associated, or the family system that will do the work; but good men, earnest men, men working in the right spirit. Thus acting, we shall advance in our great reform; and when we meet next year, in Saint Louis, brothers Vaux and Milligan and all being there, we will renew friendships, compare notes, exchange congratulations, and move onward with equal tread in the march of improvement.

Mr. White, of Kentucky, expressed his pleasure at seeing his own opinion so fully represented in this congress. Once the cry was, save the criminal; now the better idea is, to preserve from crime. The friends of this movement will hear of our doings, and take courage.

Mr. Talcott expressed much satisfaction with what he had seen, heard, and felt since he came to Baltimore. He believed that in this warfare upon crime we should prevail, relying for the victory on Him "to whom belong the kingdom, and the power, and the glory."

Dr. Wines said: I do not rise, Mr. President, to make a speech, but to give, in few words, an account of my stewardship. It is just twenty-seven months since the Cincinnati congress met, at which meeting it was voted, with absolute unanimity, that an international congress should be convened. Cincinnati asked me to undertake the organization of that movement. It was impossible to answer so grave a proposition on the spur of the moment. All I could then do was to promise to consider it, venturing, however, to add, that in case I concluded to accept the honor and the labor, if there did not, in 1872, assemble in London a congress composed of five hundred delegates, coming from the very ends of the earth, it should not be for the want of work put forth to accomplish that result. Well, the congress met in London last July. More than four hundred delegates were present. Every state in Europe, except Portugal, was officially represented. Our own Government, Mexico, several of the South American States, the West India Islands, Bengal, Ceylon, Australia, Japan, Hong-Kong, and most of the States of our own Union, had delegates there. It was an able body, equipped and ripe for the work in hand. And notwithstanding these four hundred and odd representative men and women came from so many and such widely distant regions, differing in nationalities, speech, institutions, usages, ideas, and manners, yet, after ten days of mutual conference and consultation, they were able to agree, unanimously, upon a declaration of principles of prison discipline, which was substantially an echo of the declaration made at Cincinnati. Surely, "the Divinity that shapes our ends" never stood more conspicuously revealed than in such an issue under such circumstances. I have been permitted to see all this, and to return to commit the result of the work which you gave into my hands to your judgment and kindness.

Colonel BURR, of Ohio. The congress can only say, "Well done, good and faithful servant."

Judge Walker moved a special vote of thanks to the Hon. Horatio Seymour for the ability, dignity, and courtesy with which he has performed the duties of the chair; and to Dr. Wines for his faithful, devoted, and successful services in the cause of prison reform.

In making this motion, Mr. Walker said: Ladies and gentlemen, we have all been charmed by the dignity, urbanity, and wisdom of our president in his official relations to this body, and with the clearness, power, and eloquence of his utterances, whenever he has favored the congress by taking part in its discussions. As to the corresponding secretary, we are so much indebted to his labors that language utterly fails in attempting to express our obligations to him. Except for his labors, the Cincinnati congress would not have assembled; nor the international congress have been held in London; nor the present congress have convened in Baltimore; nor the work of prison reform have gained such an impetus in this and other countries. If any man living, he surely may be congratulated on having accomplished something for the amelioration of his race.

A few words in relation to this gathering: I came here not as an expert; I had had a little experience, and had given some attention to the subject. But I came to learn, not to teach. I have enjoyed this congress; have felt it to be good to be here, among men so unselfish. It does us all good to meet with such men. I have known something of Baltimore,

but I was not prepared to see its advanced condition in relation to the great works of Christian charity. Brother Doll, to-day, indicated something very promising. God speed you in this great work for truth and humanity. Another thing: we have no *Friends* in my neighborhood in Michigan. But I have Quaker blood in my veins, and have attended many a silent meeting. I am glad to see some of the "Friends" here, aiding the good cause, in the spirit of the great Master.

He called for the vote on the resolution of thanks to the president and corresponding secretary.

Carried by acclamation.

Mr. Merrefield thanked Mr. Walker for his kindly greetings to his Quaker "Friends," and heartily reciprocated them in their name as well as his own.

Dr. Wines bowed his thanks, simply remarking that this more than paid for all the service he had rendered.

Governor Seymour said: I am deeply grateful for this kind expression of your feeling. My claims to your gratitude are light indeed compared to those of Dr. Wines. There have been features connected with this convention very peculiar. Generally men meet to carry out their special views. We met as strangers, with all shades of sentiment. Yet, with abundant sources of difference, we have gone through our deliberations in harmony. We have received the ideas of others with respect; we have advanced our own without arrogance or dogmatism. I think we may say that there is something in the very cause we are engaged in which has produced this concord and consideration for each other. We may not have accomplished all we desired and hoped for the good of those within prison walls; but we part with kinder feelings than those with which we came together. It is sad to think that many of us have met for the last time. It is my wish and hope that we may all go to our homes in safety; and that we may be successful in doing something to advance virtue, wisdom, reform, and happiness in society.

The president then declared this congress dissolved, and announced that another congress, similar in character, would convene in the city of Saint Louis in the spring of 1874.

VI.—RESOLUTIONS ADOPTED BY THE CONGRESS.

As the National Congress of Cincinnati, in 1870, adopted a comprehensive declaration of principles of prison discipline, and the International Congress of London, in 1872, re-affirmed, substantially, though in a condensed form, the same platform, it was judged by the Congress of Baltimore unnecessary to formally go over the ground again in 1873. Nevertheless, in the course of the proceedings, several members introduced resolutions relating to special points connected with penitentiary or reformatory work. These were referred, as introduced, to the business committee, which, on the last day of the session, reported them back, in a form more or less modified, for the action of the congress. The greater part of the last day's session was devoted to a consideration of the questions raised by the resolutions, which, after having been variously amended, were adopted, and are as follows:

I. *Whereas*, it is fully established by incontestable facts that intemperance in the use of intoxicating liquors is one of the principal incitements to crime, as well as a chief cause of pauperism; and *whereas*, it

follows that in proportion as intemperance is suppressed, crime and its terrible consequences will be prevented: Therefore,

Resolved, That this congress will welcome and encourage any wise and efficient measures for the suppression of this great evil, whether by an appeal to moral and religious principle, by voluntary effort, by legislative action, or by the enforcement of existing laws.

II. *Resolved*, That the best interests of prison discipline demand that the governments controlling prisons, whether state or municipal, should, through their officers, have the entire control of the prisoners, both as to their hours of work and their treatment; and that any system of leasing or of contract that does not secure this, can but be injurious to the best interests of both the prisoners and the public.

III. *Resolved*, That prisoners' aid societies and other like associations to befriend discharged prisoners and to assist them in procuring homes and employment, have proved most effective as an auxiliary in the reformatory work, and that the organization of such societies, where they do not exist, is most cordially recommended, and urged as a duty upon the friends of prison reform.

IV. *Resolved*, That the great success which has attended the effort wherever made, and especially in Philadelphia, as shown by the paper of Mr. Mullen, for the protection of persons charged with a violation of law, by a careful investigation in each case before trial by a disinterested agent appointed for that purpose, fully authorizes this congress to recommend the establishment of such an agency in each State, and especially in each large city, where, from the great number of such charges and the haste with which many of them are disposed of, there is danger that innocent persons may often be convicted of offenses wrongfully charged upon them.

V. *Whereas*, in the present state of prison reform it is impossible to determine, either with precision or unanimity, upon an ideal system of prison discipline; and *whereas*, if that were possible, radical changes in existing institutions and their mode of administration would require much time and great effort in their accomplishment: Therefore,

Resolved, That it becomes a matter of vital importance that the friends of prison reform should make prompt, vigorous, and steadily persistent efforts for the improvement of prisons as they actually exist and are administered, and especially that they should seek to educate the public mind as to the importance of elevating the character of the service engaged in their administration, and the great necessity of securing for each service men of the highest moral and intellectual character, by providing a liberal compensation therefor, and by making the employment entirely independent of partisan influence, and also that they should, by every wise and practicable effort, seek to show both the importance and the possibility of making our prisons thoroughly reformatory in their character.

VI. *Resolved*, That experience has demonstrated that juvenile reformatories, houses of refuge and protection, and industrial schools for the training of neglected, vagrant, erring, and viciously inclined youths are among the most effective means yet devised for the saving of such youths from a life of crime; and that it is essential to the highest success of such institutions that they should not, either in theory or in fact, be or be considered as penal in their character, but rather as temporary homes for their inmates, whose treatment should approximate as nearly as possible to the parental system.

VII.—THE NATIONAL PRISON ASSOCIATION OF THE UNITED STATES OF AMERICA.

1.—OFFICERS OF THE ASSOCIATION FOR 1873.

President.—Hon. Horatio Seymour, Utica, New York.

Vice-Presidents.—Hon. James G. Blaine, Speaker United States House of Representatives, Augusta, Maine; Hon. Daniel Haines, Hamburg, New Jersey; Henry W. Bellows, D. D., 232 East Fifteenth street, New York; General Amos Pilsbury, Superintendent Albany Penitentiary, Albany, New York; Hon. Conrad Baker, Indianapolis, Indiana.

Treasurer.—Salem H. Wales, 520 Fifth avenue, New York.

Corresponding Secretary.—E. C. Wines, D. D., LL.D.; office 320 Broadway; residence, Irvington, New York.

Recording Secretary.—Bradford K. Peirce, D. D., Editor Zion's Herald, Boston, Massachusetts.

2.—BOARD OF DIRECTORS.

Samuel Allinson, Yardville, New Jersey.

William H. Aspinwall, 33 University Place, New York.

Hon. Conrad Baker, Indianapolis, Indiana.

Henry W. Bellows, D. D., 232 East Fifteenth street, New York.

Hon. James G. Blaine, Speaker United States House of Representatives, Augusta, Maine.

Rev. Charles L. Brace, secretary Children's Aid Society, 19 East Fourth street, New York.

Z. R. Brockway, Superintendent Detroit House of Correction, Detroit, Michigan.

James Brown, esq., 38 East Thirty-seventh street, New York.

Charles F. Coffin, president board of directors, House of Refuge, Richmond, Indiana.

Hon. John E. Develin, New York.

Hon. Theodore W. Dwight, LL. D., President Columbia College Law School, 37 Lafayette Place, New York.

G. S. Griffith, Baltimore, Maryland.

Hon. Daniel Haines, Hamburg, New Jersey.

E. W. Hatch, M. D., Superintendent State Reform School, West Meriden, Connecticut.

Hon. R. B. Hays, Cincinnati, Ohio.

Morris K. Jesup, 59 Liberty street, New York.

John Taylor Johnston, 119 Liberty street, New York.

A. J. Ourt, M. D., corresponding secretary board of public charities, 737 Walnut street, Philadelphia, Pennsylvania.

B. K. Peirce, D. D., Editor Zion's Herald, Boston, Massachusetts.

General Amos Pilsbury, Superintendent Albany Penitentiary, Albany, New York.

F. B. Sanborn, Editor, Concord, Massachusetts.

Hon. Horatio Seymour, Utica, New York.

Hon. L. Stanford, Sacramento, California.

Oliver S. Strong, president board of managers New York House of Refuge, 61 Bible House, New York.

Salem H. Wales, 520 Fifth avenue.

Hon. and Rev. G. William Welker, Goldsborough, North Carolina.

A. R. Wetmore, president board of managers New York Juvenile Asylum, 365 Greenwich street, New York.

Hon. R. K. White, Louisville, Kentucky.

John E. Williams, President Metropolitan National Bank, 108 Broadway, New York.

E. C. Wines, D. D., LL. D., 320 Broadway, New York.

3.—STANDING COMMITTEES.

1. *Executive committee*.—The president, H. Seymour; treasurer, S. H. Wales, and secretary, E. C. Wines, *ex officio*; H. W. Bellows, Rev. Charles L. Brace, John E. Develin, and James Brown.

2. *Committee on criminal-law reform*.—H. Seymour, Daniel Haines, Conrad Baker, James G. Blaine, Theodore W. Dwight, R. B. Hayes.

3. *Committee on prison discipline*.—F. B. Sanborn, Z. R. Brockway, Amos Pilsbury, A. J. Ourt, G. William Welker.

4. *Committee on juvenile delinquency*.—B. K. Peirce, C. L. Brace, O. S. Strong, E. W. Hatch, A. R. Wetmore.

5. *Committee on discharged prisoners*.—Daniel Haines, Samuel Allinson, Charles Coffin, R. K. White, G. S. Griffith.

4.—CORRESPONDING MEMBERS.

Miss Mary Carpenter, Red Lodge Reformatory, Bristol, England.

Miss Florence Nightingale, South street, London, England.

9.—ACT OF INCORPORATION.

*The people of the State of New York, represented in senate and assembly,
do enact as follows :*

SECTION 1. Horatio Seymour, Theodore W. Dwight, Francis Lieber, Amos Pilsbury, James Brown, William H. Aspinwall, John Taylor Johnston, John E. Williams, Theodore Roosevelt, Morris K. Jesup,

Isaac Bell, James G. Blaine, Conrad Baker, Rutherford B. Hayes, Daniel Haines, Enoch C. Wines, Oliver S. Strong, Bradford K. Peirce, Charles L. Brace, Charles F. Coffin, Howard Potter, Henry S. Terbell, Z. R. Brockway, Frank B. Sanborn, Edward W. Hatch, and their associates and successors in office, are hereby constituted a body corporate and politic, by the name of "The National Prison Association of the United States of America," whose duty it shall be to consider and recommend plans for the promotion of the objects following; that is to say—

1. The amelioration of the laws in relation to public offenses and offenders, and the modes of procedure by which such laws are enforced.

2. The improvement of the penal, correctional, and reformatory institutions throughout the country, and the government, management, and discipline thereof, including the appointment of boards of control and of other officers.

3. The care of, and providing suitable and remunerative employment for, discharged prisoners, and especially such as may or shall have given evidence of a reformation of life.

SEC. 2. The principal place of business of the said corporation shall be in city of New York; and the management and disposition of its affairs, property, and funds shall be vested in the persons named in the first section of this act, and their associates and their successors in office, who shall remain in office for such period, and be displaced and succeeded by others to be elected at the times and in the manner prescribed by the by-laws. The number of members to constitute a quorum shall be fixed by the by-laws.

SEC. 3. The said corporation shall have power to purchase or take by gift, grant, devise, or bequest, real and personal property to an amount not exceeding three hundred thousand dollars, subject to the provisions of chapter three hundred and sixty of the laws of eighteen hundred and sixty.

SEC. 4. The said corporation shall have and possess all the general powers, and be subject to all the liabilities, contained in the third title of chapter eighteen of the first part of the Revised Statutes.

SEC. 5. This act shall take effect immediately.

STATE OF NEW YORK,

Office of the Secretary of State, ss :

I have compared the preceding with the original law on file in this office, and do hereby certify that the same is a correct transcript therefrom, and of the whole of said original law.

Given under my hand and seal of office at the city of Albany, this twenty-ninth day of April, in the year one thousand eight hundred and seventy-one.

DEIDRICH WILLERS,
Deputy Secretary of State.

10.—CONSTITUTION.

ARTICLE I. This Association shall be called the National Prison Association of the United States of America, and its objects shall be—

1. The amelioration of the laws in relation to public offenses and offenders, and the modes of procedure by which such laws are enforced.

2. The improvement of the penal, correctional, and reformatory institutions throughout the country, and of the government, management, and

discipline thereof, including the appointment of boards of control and of other officers.

3. The care of, and providing suitable and remunerative employment for, discharged prisoners, and especially such as may or shall have given evidence of a reformation of life.

ART. II. The officers of the association shall be a president, five vice-presidents, a corresponding secretary, a recording secretary, a treasurer, and a board of directors, not exceeding thirty in number, of which the officers above named shall be *ex officio* members.

ART. III. There shall be the following standing committees, namely: An executive committee, of which the president shall be *ex officio* chairman, the recording secretary *ex officio* secretary, and the corresponding secretary and treasurer *ex officio* members; a committee on criminal law reform; a committee on prison discipline; a committee on juvenile delinquency; and a committee on discharged prisoners.

ART. IV. The board of directors, of whom any five members shall constitute a quorum—two of said members being officers of the association—shall meet semi-annually, and in the interval of its meetings its powers shall be exercised by the executive committee, which shall fix its own time of meeting.

ART. V. Committees of correspondence shall be organized in the several States, as may be found practicable; and the formation of State associations shall be encouraged.

ART. VI. Any person contributing annually to the funds of the association not less than ten dollars shall be a member thereof; a contribution of one hundred dollars at any one time shall constitute the contributor a life member; and a contribution of two hundred dollars at any one time shall entitle the contributor to be a life director. Corresponding members may be appointed by the board of directors or by the executive committee. The power of electing officers shall be confined to the corporate members of the association.

ART. VII. The association shall hold an annual meeting at such time and place as the executive committee shall appoint, on which occasion the several standing committees, the corresponding secretary, and the treasurer shall submit annual reports. Special meetings may be called by the president in his discretion, and shall be called by him whenever he is requested to do so by any three members of the board.

ART. VIII. All officers of the association shall be elected at the annual meeting or some adjournment thereof; but vacancies occurring after the annual meeting may be filled by the board of directors, who shall also appoint all committees not chosen at the annual meeting; and all officers shall hold over till their successors are chosen.

ART. IX. The executive committee shall consist of seven members of the board of directors—the president, the recording secretary, the corresponding secretary, and the treasurer being *ex officio* members—any three of whom shall constitute a quorum for the transaction of business.

ART. X. This constitution may be amended by vote of a majority of the members of the association at any meeting thereof: *Provided*, That notice of the proposed amendment shall have been given at the next preceding meeting.

11.—BY-LAWS.

I. The order of business at each stated meeting of the board shall be as follows:

1. Reading of the minutes.
2. Report of the treasurer.
3. Report of the corresponding secretary.
4. Reports from standing committees.
5. Reports from special committees.
6. Miscellaneous business.

II. The president, corresponding secretary, recording secretary, and treasurer shall perform the customary duties of their respective offices.

III. The president shall appoint the committees, unless otherwise ordered by the association.

IV. The president shall decide questions of order, subject to an appeal; and the rules of order shall be those in Cushing's Manual, so far as they may be applicable.

V. No bills shall be paid by the treasurer unless approved and signed by the chairman of the executive committee, or by some other member of said committee designated by him.

VI. No alteration shall be made in these by-laws, except on notice of the proposed amendment given at a previous meeting of the board.

NATHAN B. ABBOTT.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

*A bill (H. R. 3041) for the relief of Nathan B. Abbott, Company H,
Twentieth Connecticut Volunteers.*

FEBRUARY 19, 1873.—Referred to the Committee on Military Affairs and ordered to be printed, to accompany H. R. 3041.

WAR DEPARTMENT, *February 18, 1873.*

The Secretary of War has the honor to report to the House of Representatives, for the information of the Committee on Military Affairs, in reply to letter of said committee of the 7th instant, inclosing a bill (H. R. 3041) for the relief of Nathan B. Abbott, herewith returned, that Mr. Abbott was promoted sergeant Company H, Twentieth Connecticut Volunteers, April 4, 1863, and is borne as such to January 22, 1865, on which date he was promoted and mustered in as a first lieutenant, and was mustered out as of that grade with his company, June 13, 1865.

A vacancy existed in Company D, Twentieth Connecticut Volunteers, for a second lieutenant, from April 21, 1864, to February 18, 1865, but the strength of the company being reduced below the minimum, numbering during that period not over seventy enlisted men, would not admit of filling said vacancy. (See act of March 3, 1863.)

The records further show that, on March 26, 1864, thirteen (13) enlisted men of Company D were transferred to the Fifth Connecticut Volunteers. This transfer was made, however, prior to the date a vacancy occurred for a second lieutenant, caused by the promotion and muster on April 21, 1864, of Second Lieutenant W. W. Spencer, to be first lieutenant.

There is no record of any service whatever rendered by Abbott in Company D, this being the only company in the regiment in which a vacancy existed during the time specified, he being borne on all the rolls of Company H as an enlisted man, and present for duty, to the date of his muster as first lieutenant of said company.

The claim has been rejected by this Department. (See copy of letter herewith from the Adjutant-General's Office, dated June 13, 1865.)

WM. W. BELKNAP,
Secretary of War.

WAR DEPARTMENT,
 ADJUTANT-GENERAL'S OFFICE,
 Washington, D. C., June 13, 1865.

SIR: I have respectfully to acknowledge the receipt of your letter of the 10th instant, asking to be allowed pay for services rendered as second lieutenant, for nine months and eleven days, but into which grade you had never been mustered.

In reply, I am directed to inform you that the regulations of the Department prohibit the receiving of pay by any officer until he has been properly mustered into service.

The records of this office show that the strength of your company, since the receipt of your commission by you, would not permit you to be mustered in as a second lieutenant. Your request, therefore, cannot be granted.

I am, sir, very respectfully, your obedient servant,

THOMAS M. VINCENT,
Assistant Adjutant-General.

First Lieutenant NATHAN B. ABBOTT,
Twentieth Connecticut Volunteers, Watertown, Connecticut.

Official copy:

THOMAS M. VINCENT,
Assistant Adjutant-General.

○

MISSISSIPPI LEVEES.

LETTER

FROM

THE SECRETARY OF WAR,

RETURNING

A bill (H. R. 3419) to aid in the rebuilding of the levees of the Mississippi River.

FEBRUARY 8, 1873.—Referred to the Select Committee on the Mississippi Levees and ordered to be printed, to accompany bill H. R. 3419.

WAR DEPARTMENT, *January 31, 1873.*

The Secretary of War has the honor to return to the House of Representatives a bill (H. R. 3419) to aid in the rebuilding of the levees of the Mississippi River, and to transmit to the House, for the information of the Select Committee on the Levees of the Mississippi River, the accompanying report of the Chief of Engineers, and its inclosure, copy of the report of Major Henry L. Abbot, Corps of Engineers, with the remark that the views of the Chief of Engineers, as contained in the last paragraph of his report, are in exact accord with his views upon the subject.

WM. W. BELKNAP,
Secretary of War.

A BILL to aid in rebuilding the levees of the Mississippi River, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That ———, together with such persons as may become associated with them for that purpose, together with their successors and assigns, are hereby created and erected into a body corporate and politic in deed and in law, by the name and title of the Mississippi Levee and Telegraph Company, and by that name shall have perpetual succession, and shall be able to sue and be sued, to plead and be impleaded, to defend and be defended, in all courts of law or equity within the United States, and may make and use a common seal, and may adopt by-laws for its regulation and government. Said corporation shall also have power to execute mortgages and deeds of trust upon its property and franchises, real and personal, and to borrow money and negotiate loans upon its bonds or other securities, contract and be contracted with, and purchase and hold real estate so far as may be necessary to carry out the objects of their incorporation, and shall be deemed to have a domicile in the States of Louisiana, Mississippi, Arkansas, Tennessee, Kentucky, and Missouri.

SEC. 2. That the capital stock of the said Mississippi Levee and Telegraph Company shall be ten million dollars, and shall consist of one hundred thousand shares of one hundred dollars each. The shares of stock shall be subscribed for on the books of said company and shall be transferable in such manner as the by-laws of said company shall prescribe; the ten persons herein first named as corporators, or any six of them, may give notice to the corporators to assemble at the city of New York, Saint Louis, or New Orleans, for the purpose of prescribing regulations for opening the books of subscription to said capital stock, at some convenient place, at such time as they may designate by public notice of at least ten days in a daily paper in each of the cities named. And the said books shall be kept open until the whole amount of said capital stock shall be subscribed, or such amount as they shall deem sufficient for the purposes of this act. A cash payment of five per centum on all subscriptions shall be paid at the time of subscribing to the person or persons properly authorized to receive the same. And whenever an amount of not less than five hundred thousand dollars shall have been subscribed to said capital stock, and five per centum of the same paid in as above prescribed, it shall be the duty of the above-named corporators (any six of whom shall constitute a quorum for the transaction of business) to call a meeting of the stockholders, at such time and place as they may deem proper, for the purpose of electing not less than five nor more than thirteen directors for said corporation, and each share of stock shall entitle the owner to one vote. The corporators herein named shall designate three of their number to act as inspectors of said election, which three inspectors so designated shall certify under their hands the names of the directors thus duly elected, and shall also notify them of their election, and the time and place of holding the first meeting of said board of directors, at which meeting the above corporators shall deliver to said directors the books of subscription to the stock of the said Mississippi Levee and Telegraph Company, together with the amount paid thereon, with a full report of their proceedings under this act; and thereupon the duties of the corporators hereinbefore named shall cease. And thereafter the said directors, with their successors or assigns, shall constitute the said body politic and corporate. The directors thus chosen shall hold their office for one year and until others are elected and qualified to fill their places. A majority of said directors shall constitute a quorum for the transaction of business.

SEC. 3. That the said directors shall, at their first meeting, elect from their own number a president and a vice-president. They may also, from time to time, elect a treasurer, secretary, chief engineer, and general superintendent, together with such other officers, agents, and employes as they may deem necessary, each of whom shall hold office or position only during the pleasure of said board of directors. The directors shall also have power to fill all vacancies in the board which may be caused by death or resignation, except as hereinbefore provided for. The treasurer and the secretary shall give such bonds, with security, as the board shall from time to time require. Meetings of the stockholders of said corporation, for the election of directors, and for the transaction of the business, shall be holden annually, and at such other times and upon such notice as may be prescribed by the by-laws. The directors of said corporation may require the subscribers to the capital stock to pay the amount by them subscribed respectively at such time, in such manner, and in such installments as they may deem proper. And if any stockholder shall refuse or neglect to pay any installment as required by a resolution of the board of directors, the said board may forfeit said stock for non-payment; and all previous payments shall revert, in law and equity, to the said corporation, under such regulations as may be adopted by the said corporation in their by-laws.

SEC. 4. That the company shall have for its objects the construction and maintenance of the levees and other works of the Mississippi, and the reclamation of the delta-lands from overflow by the waters discharged from the Mississippi River.

SEC. 5. That said corporation is hereby authorized and empowered to lay out, locate, and construct levees and a line of telegraph from Cape Girardeau, in the State of Missouri, to Fort Jackson, in the State of Louisiana, on both sides of the Mississippi River, where the same may be necessary to secure the country from inundation, which levee shall follow the river-banks as near as may be practicable and judicious. The said levees shall be constructed according to the plans and in the manner hereinafter provided in this act; and the right of way through the public lands is hereby granted to said company wherever it may be necessary to construct levees as provided in this act; and the right of way through other lands may be acquired in accordance with the laws of the State where the same may be situated.

SEC. 6. That the company shall perform such offices and build such structures and levees as may be prescribed by a commission of engineers, to be constituted as follows: The Secretary of War shall assign, as commissioners, engineer officers, one who shall be known as supervising engineer, and one for each levee district. The governors of the States of Missouri, Arkansas, Mississippi, and Louisiana shall nominate to the Secretary of War civilian engineers, who, upon passing the proper examination as herein prescribed, shall be appointed members of the commission: the governor of Missouri

shall nominate one; the governor of Arkansas shall nominate one; the governor of Mississippi shall nominate one, and the governor of Louisiana shall nominate three commissioners: *Provided*, That if any State fail to nominate and provide for the salary of any commissioner herein prescribed, then the Secretary of War, upon nomination of the Chief Engineer of the United States Army, shall appoint said civilian commissioner to be examined as above, who shall be paid by the Engineer Department of the United States.

SEC. 7. That the commissioners thus appointed shall constitute a board of engineers, skilled in the science and practice of their professions. The engineer designated as supervising engineer by the Secretary of War shall be chief of the commission. The commission shall establish and hold their chief office in the city of New Orleans, and shall establish the offices of the sub-commission in each levee district; they shall provide by-laws for governing their mode of operations, in performing their duties under this law; they shall meet once a year, and oftener if called together by the chief commissioner; they shall have a secretary, and such employés as they may require; they shall devise plans by means of levees, and like works, for the reclamation of the great body of lands styled "The Delta of the Mississippi River," and such as are liable to inundation by the high waters of that river. And for this purpose they shall divide the area into six levee districts or natural basins, as hereinafter described, namely:

District number one: All the alluvion below Baton Rouge, and on the left of the river, to the Gulf of Mexico, and to be styled the New Orleans district.

District number two: All of the alluvion below Red River, and west of the Mississippi to the Gulf of Mexico, and to be styled the Donaldson district.

District number three: All the alluvion in Louisiana north of Red River and west of the Mississippi, and to be styled the Delta district.

District number four: All the alluvion east of the Mississippi, below Memphis and above Vicksburgh, and to be styled the Yazoo district.

District number five: All the alluvion below the Saint Francis and above latitude thirty-three north, and west of the Mississippi River, and to be styled the Arkansas district.

District number six: All the alluvion above the Saint Francis and below Cape Girardeau, to be styled the Saint Francis district.

The offices in each district to be fixed by the commission, and changed at option.

SEC. 8. That the commission shall prescribe rules and regulations for the general conduct of the surveys of the Delta, and for the mode of constructing works, the form, dimensions, and material to be used in construction, the mode and extent of expenditures by the sub-commissions, and shall fix and determine the responsibility, and provide rules and regulations for the government of officers and employés, and shall make all other necessary rules and regulations.

SEC. 9. That sub-commissions shall be composed of one United States engineer, and one civilian engineer, to act in each levee district, the commissioner for Missouri, with one United States engineer, in the district above the mouth of the Saint Francis; the commissioner for Arkansas, with one United States engineer, in the district below the Saint Francis, and above latitude thirty-three north, on the right or west of the Mississippi River; the commissioner for Mississippi, with one United States engineer, to serve in the district below Memphis, and above Vicksburgh, on the left or east of the Mississippi; the commissioners for Louisiana, to be assigned to duty, with one United States engineer each, to the district north of Red River, west side, to the district below Red River, right or west side, and the district below Baton Rouge, left or east side of the Mississippi River, the latter two districts extending to the Gulf.

SEC. 10. That the sub-commissioners shall have their offices at such points as may be fixed by the commission and shall be charged with the execution of all the surveys required within the several districts, the location of all levees and works therein, not provided especially by the commission. They shall have executed complete maps, plans, and profiles of the works to be constructed by the Mississippi Levee and Telegraph Company, and shall make the plans and specifications, according to instructions from the president or the commission; one for the company, and duplicates in all cases, by tracing, for the chief officer and for the Engineer Department of the United States Army.

SEC. 11. That each sub-commission shall employ such civil engineers, and at such compensation as shall be prescribed by the commission or authorized by the president of the board; each employé to be examined by the commission as to fitness for the specific duties required, unless he shall hold a certificate as "Levee engineer" from the examining committee of the board, to be detailed by the president. They shall have such organization and perform such duties as the commission shall prescribe.

SEC. 12. That each sub-commission shall complete the reconnaissances, surveys, and estimates for each succeeding year's work, and return the same to the chief officer on or before the twenty-fifth day of October, annually. The sub-commissioners shall decide, by lot, which shall be sub-chief, when both are present, and in the absence of either the other shall act as chief for executive functions only; afterward the oldest

in the service shall be chief. All measures to be adopted shall require their joint action and signature. In all cases of difference between the sub-commissioners in matters of engineering, the supervising engineer shall decide the matter of difference, and in all other cases the president of the company shall decide. Each and every commissioner shall pass over the levees and works of his entire district, annually, for detailed reconnaissance, and as often as the nature of the works may demand. But both shall not absent themselves from their office at the same time, without special permission of the president.

SEC. 13. That the commissioners and all their employés shall keep exact accounts of their necessary expenditures, and shall account and vouch for the same, in the manner and under the regulations of the War Department. They shall cause monthly estimates to be made of the work performed by the Mississippi Levee and Telegraph Company, since the last estimate, and these shall be forwarded to the chief office and cumulated on or before the tenth day of the month; and the president shall draw his warrant upon the United States Treasury for the amount in favor of the Mississippi Levee and Telegraph Company, reserving always twenty per centum on all works unfinished. This warrant, approved by the Chief of the United States Engineers, shall be paid out of any moneys in the Treasury of the United States appropriated to this purpose.

SEC. 14. That the commission shall provide for monthly requisitions for funds needed in payment of laborers, clerks, stationery, assistant engineers, and all other expenses incident to the office of the commission and each sub-commission. The commission shall report monthly the joint reports of the sub-commissions; and shall report the progress of works, and the general condition of the alluvial country to the Engineer Department, United States Army, and shall publish abstracts of the same.

SEC. 15. That the Mississippi Levee and Telegraph Company shall, by their officers, agents, and their chief engineers of the districts, apply at the offices of the sub-commissioners for such maps, plans, profiles, and specifications of works as may be prepared for them, and they shall, as early thereafter as practicable, proceed to contract said works, and complete them with dispatch.

SEC. 16. That the district chief engineers of the company shall, monthly, detail such assistant, or proceed himself, with the assistant commission engineer, to measure the amount of work done, in such manner, time, and order as that the work of monthly estimates shall be completed on or before the first day of each month. These, when revised by the sub-commissioners, shall be forwarded to the chief office within the first five days of each month.

SEC. 17. That sub-levee districts, of convenient length, shall be created for the assistant engineers of the commission and of the company, to visit, watch, and direct the progress of construction, and to see that the material used and the performance of the work shall be in accordance with the specifications. And every engineer employé of the commissioners shall have power and shall be instructed to arrest and report any fraud or laches in the construction of the works, or avoidable delays in their prosecution.

SEC. 18. That the company shall keep an adequate force on the levees during high waters, and an adequate amount of material for the prompt arrest of any crevasse that may occur; and the company shall be responsible for damages actually proved before the courts as caused by the laches of the company.

SEC. 19. That whenever, in the opinion of the commission, it shall be necessary to destroy valuable improvements, or to expose the same to inundation, or to exclude improved lands in order to construct new levees, said improvements shall be valued or damages estimated according to the average of the State assessments for the five years last preceding in which taxes shall have been paid, and adding twenty per centum thereto; the amount so obtained shall be paid to the owner under such rules as may be prescribed by the company, and approved by the Engineer Department of the United States Army: *Provided, however,* That no payment shall be made upon lands or improvements existing within three hundred feet of the river's bank when the survey for the new levee shall be made: *Provided further,* That thirty days' notice shall be given for the removal of improvements on such lands.

SEC. 20. That the commission shall have power to close all outlets to the Mississippi River, where, in their judgment, the reclamation of lands of the Delta will justify the same.

SEC. 21. That should the commission deem it necessary to create reservoirs in controlling the inundations of the Mississippi, they shall make an estimate of the areas to be thus submerged, and the cost of purchase of the lands required, and submit the matter to Congress in the estimates for the next year's works, as a separate item for an appropriation.

SEC. 22. That the company shall be authorized to contract, on equitable terms, with any company now existing, created for the purpose of building levees and being incorporated by or in accordance with State laws; and shall be authorized to construct through said companies or to buy out their charters and privileges.

SEC. 23. That the Mississippi Levee and Telegraph Company shall be paid for their

works and levees on the basis of fifty cents per cubic yard for earth-work, and fifty dollars per thousand for lumber-work, and ten cents per cubic foot for timber-work. In all cases of work that is extra-onerous or not estimable in either of the above forms, under rules established by the commission, it shall be so reported, and computed in cubic yards, lumber or timber, as the case may be, and the estimate shall contain the extra-onerous work as a special item in each work or estimate. All operations of the commissions to be approved by the Chief Engineer of the United States Army.

SEC. 24. That the company shall commence the construction of said levee at three points—Cape Girardeau, Arkansas River, and Red River, and complete not less than one hundred miles of levee within two years from the passage of this act, and continue to construct each year thereafter a sufficient number of miles to secure its final completion within five years: *Provided*, That Congress shall appropriate a sufficient amount of money to enable the company to build the amount of levees proposed at the rates provided in the preceding section of this act.

SEC. 25. That the company shall procure properly authenticated copies of this act and charter, and shall take such measures as shall early obtain the right of jurisdiction herein contemplated in each of the several States named, and a formal recognition of this charter; and they shall file the same in the office of the Secretary of War of the United States.

SEC. 26. That the said levee and telegraph-line shall be deemed and considered a national and public work, and no tax shall be imposed by virtue of any State authority upon the property of said company used in the construction of said public work.

SEC. 27. That if any person shall willfully do or cause to be done, any act or acts whatever whereby any levee, structure, or other work, or any engine, machine, or other property appertaining to said levee or telegraph-line, shall be injured, impaired, or destroyed, the person or persons so offending shall be guilty of a misdemeanor, and, on conviction thereof by any court of competent jurisdiction, shall be punished by fine not less than five hundred nor more than one thousand dollars, or by imprisonment not less than one year nor more than five years, or both, at the discretion of the court, and shall also forfeit and pay to the said company, its successors, or assigns, double the amount of damages sustained by means of such offenses, to be recovered by said company, with costs of suit, by action of debt or case. In all actions at law, either by or against the company, suits may be brought in either the State or United States courts at the option of the plaintiff.

SEC. 28. That said Mississippi Levee and Telegraph Company shall have power to issue bonds secured by mortgage on all or any portion of the property and franchises of the said company; the said bonds shall have not less than twenty years to run, and shall bear not more than seven per centum interest per annum, payable semi-annually, at such times and places as said company may determine, the principal and interest to be paid in gold: *Provided*, That when such mortgages are made and executed by the company, they shall be filed and recorded in the War Department of the United States, which shall be sufficient evidence of their legal execution, and shall confer all the rights and property of said company as therein expressed.

SEC. 29. That said corporation shall make an annual report of their operations to the Secretary of War, in such form and containing such items of information as he may prescribe; said report to be verified by the certificates, under oath, of the president, treasurer, chief engineer, and general superintendent of said corporation.

SEC. 30. That this act shall take effect from the date of its passage, and may be altered, amended, modified, or repealed by the Congress of the United States as the public good may require.

SEC. 31. That the sum of ——— dollars is hereby appropriated from the Treasury of the United States for the purposes herein named for the fiscal year ending June thirtieth, eighteen hundred and seventy-four.

[INDORSEMENT.]

Respectfully referred to General Humphreys, Chief of Engineers, who will please give his views as to the propriety of the passage of this bill to the House Committee on Mississippi Levees.

Any suggestions for modification or improvement will be gladly received.

FRANK MOREY,

Chairman House Committee on Levees of the Mississippi.

OFFICE OF THE CHIEF OF ENGINEERS,
Washington, D. C., January 28, 1873.

SIR: I beg leave to transmit herewith H. R. 3419, "a bill to aid in rebuilding the levees of the Mississippi River," referred to me by the chairman of the Committee on Levees, and respectfully request, if it meet your approval, that it be returned to him with this communication.

The bill was referred to Major Abbot, of the Corps of Engineers, for report, and his reply, a copy of which is submitted, contains valuable suggestions.

The bill in substance proposes that the United States shall enter into a contract with certain parties, not yet named, to build the levees of the Mississippi River, from Cape Girardeau to the Gulf of Mexico, at a certain fixed price, the location, form, dimensions, and character of the levees to be fixed by a commission composed of seven United States engineer officers and six civil engineers, virtually appointed by the governors of the States in which the levees are to be built, the ranking United States engineer presiding over the commission. This commission is to supervise the construction of the levees, and pay the contractors from appropriations made by Congress.

Since the levees are to be built by appropriations of Congress, I think the usual method of executing the engineering works of the Government would be simpler, easier, more economical, and more efficient, and that the work would be in every respect more satisfactorily performed in that way than in any other.

Very respectfully, your obedient servant,

A. A. HUMPHREYS,
Brigadier-General and Chief of Engineers.

Hon. W. W. BELKNAP,
Secretary of War.

WILLET'S POINT, NEW YORK,
January 24, 1873.

GENERAL: I have the honor to return herewith the bill (H. R. 3419) to aid in rebuilding the levees of the Mississippi, forwarded with your letter of 17th instant, with the following report:

I have given no study to the financial features of the bill, but would suggest that there ought to be some provision for the payment of the bills of the commission without requiring an annual appropriation of Congress. The company might, by their bonds, raise enough money to continue work, even if an annual appropriation should fail or prove to be inadequate; but in such a case the commission would have to discharge its employes, and there would then be no Government supervision.

I would also invite attention to the absence of any provisions regulating the telegraph.

The general plan of the commission seems to be admirable.

Some provisions respecting a general inundation, which might occur in a great flood year, would seem to be required, as unexpected outlay to secure work already done might be called for without corresponding appropriations.

I think section twenty-four requires careful consideration. The effect of beginning work at the three points named would certainly be to inundate the Yazoo bottom-lands, and probably to work great injury to Lower Louisiana before the lower levees could be raised to the requisite

height to restrain the increased floods. Undoubtedly, if no levees existed, the proposed plan would be the best; but under existing circumstances it admits of doubt whether some raising of the lower levees should not precede the pouring of an increased volume upon them.

The division of the region into levee districts is made with excellent judgment, but the work in the "Arkansas district" below Arkansas River would have to be pushed forward before the "Delta district" could be protected by its own system.

I am, general, very respectfully, your obedient servant,

HENRY L. ABBOT,

Major of Engineers.

General A. A. HUMPHREYS,

Commanding Corps of Engineers.

REMOVAL OF CERTAIN CHIPPEWA INDIANS.

L E T T E R

FROM

THE SECRETARY OF THE INTERIOR,

TRANSMITTING

A memorial of the legislature of Dakota, praying that the Pembina band of Chippewa Indians be removed from the lands on the Dakota side of the Red River of the North to the White Earth reservation in Minnesota.

FEBRUARY 8, 1873.—Referred to the Committee on Indian Affairs and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., January 30, 1873.

SIR: I have the honor to inclose herewith a copy of a letter from the Acting Commissioner of Indian Affairs, dated the 28th instant, inclosing a copy of a memorial of the legislature of Dakota, approved January 6, 1873, addressed to the President of the United States, praying that the Pembina band of Chippewa Indians be removed from the lands on the Dakota side of the Red River of the North to the White Earth reservation in Minnesota.

Agreeably to the recommendation of the Acting Commissioner, the memorial is respectfully transmitted for consideration, in connection with Department letter of the 13th, addressed to the Speaker of the House of Representatives, submitting an estimate of \$35,000 for the accomplishment of the purpose contemplated by the memorial.

I have the honor to be, your obedient servant,

C. DELANO,
Secretary.

Hon. JAS. G. BLAINE,
Speaker of the House of Representatives.

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, D. C., January 28, 1873.

SIR: I have the honor to acknowledge the receipt, by reference from you, of a copy of a memorial by the legislative assembly of the Terri-

tory of Dakota, approved January 6, 1873, to the President of the United States, praying that the Pembina band of Chippewa Indians might be removed from the lands on the Dakota side of the Red River of the North, to the White Earth reservation in the State of Minnesota.

I respectfully recommend that the said memorial be submitted to Congress for consideration, in connection with the recommendation of this office upon the subject to the honorable Secretary of the Interior, dated the 11th instant, which was transmitted to Congress with Department letter of the 13th instant.

The memorial is herewith returned.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. SECRETARY OF THE INTERIOR.

A MEMORIAL to the President of the United States relative to the Pembina band of the Chippewa Indians.

To His Excellency the President of the United States:

Your memorialists, the legislative assembly of the Territory of Dakota, would most respectfully represent that the Pembina band of Chippewa Indians are still occupying the lands on the Dakota side of the Red River of the North, which were ceded by the said band and the Red Lake band of the Chippewas, in their treaty with the United States in 1863, and that the occupation of said lands by said Pembina band is a great nuisance to the white settlements on the Pembina and Red Rivers, and also retards the establishment and growth of new settlements on the ceded lands.

Your memorialists therefore pray that said last-named band of Indians be removed from the ceded lands, and settled upon their reservation at the White Earth agency, in Minnesota, according to the stipulations in said treaty.

And your memorialists, as in duty bound, will ever pray.

Approved January 6, 1873.

I certify that the above is a true copy of a memorial passed at the tenth session of the legislative assembly of the Territory of Dakota, and approved by me on the 6th day of January, A. D. 1873.

In testimony whereof, I have hereunto set my hand, and caused to be affixed the great seal of the Territory, this 10th day of January, A. D. 1873.

[SEAL.]

JOHN A. BURBANK,
Governor.

Attest:

EDWIN S. MCCOOK,
Secretary.

PRESERVATION OF ARMY CLOTHING.

LETTER

FROM

THE SECRETARY OF WAR,

TRANSMITTING

An estimate to carry out the plans adopted for the preservation of Army clothing and equipage.

FEBRUARY 8, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT,
 Washington City, February 4, 1873.

SIR: I have the honor to transmit herewith an estimate prepared by the Quartermaster-General of an amount required to carry out the plans adopted for the preservation of Army clothing, and to respectfully urge its early consideration.

Should Congress deem it proper to make the appropriation, I recommend that it be made available on the approval of the act, so that the process may be at once applied to the stock of clothing material now on hand.

A pamphlet copy of the report of the board appointed to consider this subject accompanies the estimate.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
 Secretary of War.

The SPEAKER of the House of Representatives.

Estimates of appropriations required for the preservation of clothing and equipage on hand in the Quartermaster's Department.

CLOTHING AND EQUIPAGE.

QUARTERMASTER-GENERAL'S OFFICE,
 February 3, 1873.

For the preservation of clothing and equipage by the moth and mildew-proof process, adopted and now in use by the War Department, in conformity with the recommendation of the board of which Colonel R. B. Marcy, inspector-general, was president \$300,000

M. C. MEIGS,
 Quartermaster-General.

The Honorable the SECRETARY OF WAR,
 Washington, D. C.

Official reports and documents as to the preservation of the clothing and equipage of the Army and Navy of the United States, by the process of George A. Cowles & Co., as adopted by the War and Navy Departments, for the prevention of destruction by moth and mildew, and rendering the same water-repellent.

OFFICE OF GEORGE A. COWLES & COMPANY,
217 Levant Street, Philadelphia, Pennsylvania, January, 1873.

The great enemy to the clothing and equipage of all armies is the moth in woolen fabrics, and mildew in canvas. The destruction in the Army material of the United States for the past twelve years, from these causes, has been estimated as high as thirty millions of dollars; and although the Quartermaster's Department used every known means to arrest this waste, no plan was found to avail until the introduction of the process of George A. Cowles & Co., which was presented as a moth-proof, mildew-proof, and water-repellent; economical in its application, the expense bearing no proportion to the value of the goods treated. Four years ago the Department commenced a series of rigorous experiments, to determine if our claims would stand the test of experimental and practical use; and the result has been that the Quartermaster-General and the Secretary of War have indorsed and adopted our process as being all that it was claimed to be: a preventive against the enormous destruction of woolen and cotton fabrics, and a safeguard in the future against loss either from moth or mildew, besides rendering the goods water-repellent.

The amount of Army woolen and cotton goods on hand June 30, 1872, (the latest official returns,) and which can be saved by our process, but which is as yet unprepared and liable to destruction, especially during the approaching spring and summer, (the period when the moths are most active,) is given by General J. D. Bingham, in charge of the clothing branch of the Quartermaster-General's Office, as of the value of over twenty-three millions of dollars. (See page 31.)

We submit the proceedings and report of a board of officers of high rank, appointed last month by the honorable the Secretary of War to examine thoroughly into the merits of our process as applied to Army clothing and equipage. To the report we have added all the official correspondence and other official data upon the subject, so as to give a clear and intelligent explanation of the process, a statement of the severe and exhaustive tests to which it has been officially subjected, and a history of the matter from the first experiments made by direction of the War Department down to the present time.

While the report is full, comprehensive, and emphatic in our favor, yet the evidence shows it by no means exaggerates the facts of the case. The testimony of the late chief inspector at the principal clothing depot, and of the present chief inspector, explicitly declares that our process has the effect of strengthening the fabric treated; while an overwhelming mass of testimony proves it to be an absolute safeguard against mildew.

It is gratifying to us to find that our process has withstood all the tests; and that the minute and searching examination of witnesses under oath—employés of the Government—just had by the board, has confirmed every statement and claim we had heretofore made in connection therewith, and has resulted in a unanimous report, which concedes the success of our process, its great value to the Government, and recommends its continued use by the War Department; the report having been indorsed by the Quartermaster-General and approved by the Secretary of War.

For the past year we have also prepared all the clothing for the use of the Navy, and we present the following letter from Paymaster-General Dunn as evidence of the satisfaction of the Navy Department with our process:

"NAVY DEPARTMENT, BUREAU OF PROVISIONS AND CLOTHING,
" Washington, January 18, 1873.

"GENTLEMEN: The Bureau has received a copy of the report of the board of officers of the Army, convened at Schuylkill arsenal, Philadelphia, on December 18, 1872, of which General R. B. Marcy was president, relative to clothing prepared by your process for its preservation.

"The report confirms the Bureau in its opinion of the great value of your process for preserving clothing, and it will continue to have all the new navy-cloth clothing prepared in that way.

"Very respectfully,

"EDWARD T. DUNN,
" Paymaster-General United States Navy.

"Messrs. GEO. A. COWLES & Co.,
" Philadelphia, Pennsylvania."

Our business has been in operation since 1864, during which time we have been largely engaged in applying the process to woolen and cotton goods. We have hundreds of testimonials from business firms and private individuals, as well as from mem-

bers of the New York police force, who, through our process, have been enabled to dispense with rubber coats—at once unhealthy and uncomfortable—and who testify that they are kept dry in the heaviest rains when wearing our prepared clothing. Valuable, however, as these statements of private persons are, we consider the official reports of the War and Navy Departments as more important and conclusive testimony; and as such we confine ourselves in these pages to official documents alone.

The documents show that the scientific and distinguished head of the Quartermaster's Department exercised the utmost caution in having our process fully examined before indorsing its merits; and, after an exhaustive series of tests for years, felt it his duty to report to Congress, at its last session, that he considered it "a judicious and economical measure" to make appropriations for the application of the process, there being in store at the principal depots of the Department several million dollars' worth of clothing liable to be destroyed by moths, to say nothing of the preservation of new clothing and material, and the vast saving in canvas, which, if made mildew-proof, would last for years, while unprepared it is seldom serviceable beyond a single season, and in many instances is destroyed by mildew in a few months.

GEORGE A. COWLES & CO.

Report of the military board upon the merits of the preservative process of George A. Cowles & Co. as applied to Army clothing and equipage; together with the approval of the Quartermaster General and the honorable the Secretary of War.

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., January 10, 1873.

GENTLEMEN: In compliance with your request of the 2d instant, I herewith inclose copies, extracts, and accompanying documents, of the report of the board of officers convened at Schuylkill arsenal, on the 18th ultimo, to investigate your process, in its application to Army clothing and equipage.

Very respectfully, your obedient servant,

M. C. MEIGS,

Quartermaster-General, Brevet Major-General, U. S. A.

Messrs. GEO. A. COWLES & Co.,
217 Levant street, Philadelphia, Pa.

WASHINGTON, D. C., December 30, 1872.

GENERAL: I have the honor to transmit herewith report and proceedings of the board convened at Schuylkill arsenal, Philadelphia, in compliance with part 5, Special Orders 329, current series, War Department, together with all the papers laid before the board by you.

Very respectfully, your obedient servant,

R. B. MARCY,

Inspector-General U. S. A., President of the Board.

Brigadier-General M. C. MEIGS,
Quartermaster-General U. S. A., Washington, D. C.

WASHINGTON, D. C., December 30, 1872.

The board convened in compliance with paragraph 5, Special Orders No. 329, War Department, current series, for the purpose of examining into the condition of certain clothing, which has been subjected to George A. Cowles & Co.'s process for its preservation, has the honor to submit the following report:

The board assembled at Schuylkill arsenal, Philadelphia, on the 19th instant, and after having been duly sworn to a full and impartial investigation of the subject before it, proceeded to take the sworn testimony of the officers in charge, employés, and others, from whom it was supposed reliable evidence could be elicited touching the process and its results; all of which is fully set forth in the detailed record of proceedings hereto appended. The officers in charge of the arsenal, and Cowles & Co., were asked to inform the board of any evidence within their knowledge bearing on the questions before it.

A careful consideration has been given by the board to the reports and other documentary evidence submitted by the Quartermaster-General, and the papers laid before it by Cowles & Co., and General Easton, the officer in charge of the arsenal.

The board also carefully and extensively examined prepared clothing that had been

baled for sixteen months, together with a large amount that had lain loosely piled in the arsenal for the last six months, much exposed to the action of moths.

Baled and loose unprepared clothing was examined in like manner. No moth-ravages whatever were found in the baled prepared clothing, while in the unprepared it was extensive. In the loose prepared clothing slight evidences of moths were found, and two or three living moths, but no extensive damage. The ravage was confined to loose foreign "fluff" on the garments, and slight attacks on the nap of the cloth, but in no case was the body of the fabric injured.

The factory of Cowles & Co. was visited by the board, and their process fully and minutely explained and exemplified by the firm. They also exhibited to the board a large number of overcoats in a moth-eaten condition, which, the evidence shows conclusively, had been sent to them in that condition; a portion of these coats were badly eaten.

After this careful and critical personal examination, and mature deliberation upon all the evidence the board has been able to elicit, it has arrived at the following unanimous conclusions, viz

That clothing has become damaged by moths, in rare instances and to a slight extent, since being prepared by the process of Cowles & Co.; but the cases are so very exceptional, and the damage so slight, as to induce the belief that moths will not fasten themselves on the fiber to any serious extent, or do any material injury to the body of the cloth.

On the other hand, the evidence is abundant, continuous, clear, and positive, that the prepared goods withstand the action of moths, are in a measure water-repellent, and resist mildew far longer than the unprepared; that the process does not discolor the cloth, creates no odor, does not diminish the strength of the material, and is no injury to the wearer.

The board regards the process a good one, and is of the opinion that it should be continued so long as a better or cheaper does not offer.

In support of this view of the case, the board would respectfully refer generally to the volume of testimony noted in the appendix, and particularly to the strong and pointed statements of Neal Campbell, Captain Van Antwerp, F. S. Johnston, William Preston, and Captain Alligood.

The few prepared garments so slightly injured, when compared with the great number so well protected, even though unusually exposed, leads to the conclusion that their injury is due to some little defect in the preparation, leaving parts exposed to the action of the moths, rather than to the process itself, which has so well withstood the rigorous tests set forth in the reports and evidence; and it shows conclusively that the process is highly valuable that protects the clothing at so slight a percentage of loss, compared with the great losses of the past.

The board is not unmindful of the reports of Captain Alligood; but from the examination of the clothing, and in the face of the evidence that moth-eaten goods have been sent to the factory, and that a large quantity is now there, the board cannot but be of the opinion that much of the damage found on prepared articles existed before they were sent to Cowles & Co.'s factory.

Nor have the adverse reports of Captain E. B. Carling, assistant quartermaster, Lieutenant R. E. Armstrong, Lieutenant O. E. Michaelis, and Captain Dupont been disregarded; but a careful examination of each case, by direction of the Quartermaster-General, proves that the articles reported on did not bear the mark or stamp of Cowles & Co.

Aside from this apparently adverse evidence, which appears to be fully answered, the testimony throughout sustains the conclusions reached by the board.

The board respectfully recommends that further tests be made, not so much to establish the benefits of the process, which seem pretty well proven, but to ascertain what actual loss under ordinary exposure may occur.

In making such tests, prepared and unprepared garments should be taken and carefully examined, to ascertain that they are not moth-eaten or in any way injured; then, packed in the same way or exposed to like other tests, and kept at various principal points, and in warm climates, until one or the other or both shall become unmistakably and extensively damaged by moths.

Much complaint of moth-damage to garments already prepared will doubtless arise, for the reason that many moth-eaten ones have been sent to the factory of Cowles & Co. and prepared, and now bear the company's stamp. This clothing will be sent out, and when found in a damaged condition by those not cognizant of the facts, the reports will be against the process, and the company will suffer in consequence.

* * * * *

R. B. MARCY,

Brevet Major-General, Inspector-General U. S. A., President.

RUFUS INGALLS,

Brevet Major-General, Assistant Quartermaster-General U. S. A.

J. G. C. LEE,

Brevet Lieutenant-Colonel, Assistant Quartermaster U. S. A., Recorder.

WASHINGTON, D. C., December 30, 1872.

Colonel R. B. Marcy, Inspector-General United States Army, president of the board, transmits report and proceedings of the board convened at Schuylkill arsenal, Philadelphia, by paragraph 5, Special Orders No. 329, current series, War Department, (to examine into the effect of the process of Cowles & Co., for preserving woolen garments from the ravages of moths, and for other purposes.)

The report and proceedings are respectfully forwarded to the honorable the Secretary of War.

I concur in the opinions and recommendations of the board, and recommend their approval by the Secretary of War.

M. C. MEIGS,
Quartermaster-General, Brevet Major-General U. S. A.

The Secretary of War concurs in the views and recommendations of the board, and directs that they be carried out. The Secretary also grants authority to the Quartermaster-General to furnish Cowles & Co. copies of so much of the report and accompanying papers as he may deem advisable.

By order Secretary of War.

H. T. CROSBY,
Chief Clerk.

Official copy and extract of letter and indorsements.

J. D. BINGHAM,
Brevet Brigadier-General and Quartermaster.

[Special Orders, No. 329.]

Proceedings of the board of officers convened at Schuylkill arsenal, Philadelphia, Pennsylvania, in pursuance of the following order :

WAR DEPARTMENT, ADJUTANT GENERAL'S OFFICE,
Washington, December 16, 1872.

* * * * *

5. A board to consist of Colonel R. B. Marcy, Inspector-General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster, will assemble at Schuylkill arsenal, Philadelphia, on the 18th day of December, 1872, or as soon thereafter as practicable, to examine into the condition of certain clothing which has been subjected to George A. Cowles & Co.'s process for its preservation.

The board will report whether or not any of the clothing has become damaged since being prepared by the process mentioned, from causes against which it is guaranteed as a protection, and whether or not in their opinion it is advisable to continue its use.

The Quartermaster-General will lay before the board all papers on file relating to the subject, and will notify the contractors interested of the meeting of the board. The board will forward their report to the Quartermaster-General. The junior member of the board will act as recorder.

By order of the Secretary of War.

E. D. TOWNSEND,
Adjutant-General.

Official :

W. D. WHIPPLE,
Assistant Adjutant-General.

SCHUYLKILL ARSENAL, PHILADELPHIA,
December 19, 1872.

The board met at 10 o'clock a. m. Present : Colonel R. B. Marcy, Inspector-General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster.

The members were then sworn to a faithful and impartial discharge of their duty.

The papers submitted by the Quartermaster-General were then laid before the board by the president.

Captain C. A. ALLIGOOD, military store-keeper United States Army, was then called before the board and duly sworn, when he made the following statement :

My reports, made from time to time to Colonel L. C. Easton, Assistant Quartermaster-General, are true to the best of my knowledge and belief. The overcoats spoken of therein bore the marks of George A. Cowles & Co., as having been submitted to their process. All coats were prepared by them after being made up. The trousers were made up in this arsenal, from cloth that had been submitted to the process in the piece. I do not know whether at this late season there is any clothing in the arsenal on which moths are at work or not. I think it is now too cold. I can exhibit clothing with Cowles & Co.'s marks on that are moth-eaten. I presume that many coats were sent to Cowles & Co. that were somewhat moth-eaten. I arrive at this conclusion from incidents during the investigation of this matter. I am satisfied that other garments were eaten since they were prepared. I have seen moths in the larvæ state, in the chrysalis state, and in the cocoon, on clothing prepared by Cowles & Co., but cannot tell on how many garments. The instances were rare. I do not know, but it is my impression that the authorities say the moths remain dormant during the cold weather, yet keep adding layers or sections to the cocoon. The larvæ, as I understand it, is the naked worm, without surroundings, or external coverings.* The chrysalis state is the worm in the cocoon. The cocoon is similar in color to the material on which it is working. The cocoon appears to be made of the material of the garment. I don't know whether it is the material itself or transformed in any way. I am led to believe that some clothing sent to Cowles & Co. had been eaten somewhat by moths previous to being sent, from the facts that the inspectors are liable to carelessness in inspecting, and the presence of coats at the factory of Cowles & Co., as seen by the chief clerk and inspector, so injured. I do not remember whether the chief clerk and inspector, in their verbal report, state that they were satisfied that the goods were so short a time in the possession of Cowles & Co. that they could not become moth-eaten while there. I do not know how they could tell how long these coats had been in Cowles & Co.'s possession, as that firm had been receiving coats for months.

Question by the board. Why was the report of the chief inspector and the chief clerk a verbal one ?

Answer. I did not require them to make a written one.

Q. by B. Did you order them to make a report in writing before they called at Cowles & Co.'s factory ?

A. Do not remember whether I did or not.

Q. by B. Where is your chief clerk, W. B. Collins ?

A. I do not know. He sent me a note that he could not be here to-day. I think he has gone to Washington.

Q. by B. You have stated that you do not allow many goods to lie over. How many garments are at present in the arsenal unbaled ?

A. I do not know. There is a large number.

Q. by B. Is there anything in the appearance of the moth-tracks to indicate whether their work was done before or after being prepared ?

A. Yes, sir. The presence of live moths in the various stages; the location of the moth-eaten parts. The fact that the trousers were made out of material prepared by Cowles & Co., and has passed since then through so many hands—the cutters, the makers, and the inspectors—prior to being stored, that the discovery of damage would have been almost inevitable had it occurred before being prepared.

Q. by B. During the interval from the manufacturers to the time moths were discovered, were the goods exposed to moths ?

A. They were, because, being prepared by this process, it was not thought necessary to protect them from the ravages of the moths.

Q. by B. Was it not possible, or even probable, that the moths were attracted to these goods by foreign material which had fallen thereon ?

A. It is possible on the coats; on the pants improbable, and I think impossible.

Q. by B. Do you believe that Cowles & Co.'s preparation of Army fabrics serves to make them water-repellent ?

A. I think, from the best evidence I have, that the preparation renders them water-repellent.

Q. by B. Do you think that the process renders fabrics mildew-proof ?

A. I do not know. I am informed by the employés, who claim to have tested it previous to my arrival at this place, that the tests establish the mildew-preventive qualities of the preparation.

NEAL CAMPBELL, late inspector at the Schuylkill arsenal, was then called before the board and duly sworn.

* See Harris's statement as to the habits of the clothes-moth, p. 18.

Question by the board. State your name, and the position you formerly held at this arsenal?

Answer. My name is Neal Campbell. I was chief inspector here.

Q. by B. State to the board all the facts within your knowledge in relation to the clothing and equipage that have been submitted to the process of George A. Cowles & Co., giving dates of application of process, date of examinations, and results.

A. The great-coats were the principal things that I examined. They were submitted to the process about August 11, 1869. Four of them were exposed among clothing covered with moths until December, 1870, when I examined them, and found no indication whatever of moths on them. The other clothing in which they were buried was being eaten up by moths. I caught twelve or fifteen live moths with cocoons, and put them in one of these four great-coats treated by the process, and put it aside for five weeks; when opened and examined, I found some of the moths alive and some dead, and the coat untouched, except in one small place, requiring close scrutiny to find it. This was in the following summer of 1871. All my reports to Captain Van Antwerp are true.* I have never discovered live moths at work on the clothing prepared by Cowles & Co. I have never seen live moths on the prepared clothing, except when put on for experiment. I experimented on clothing prepared and unprepared, and invariably found moths at work on the unprepared. I regard the preparation as a certain preventive to the action of moths. I was prejudiced against the process at first, and for that reason submitted the clothing to the most rigorous tests. It does not discolor the clothing. There is no disagreeable odor. I think the fabric is as strong after the process as before. Not many garments were prepared, but a large amount of kersey. I have been on duty at this arsenal off and on since 1830, most of the time. Have handled large amounts of cloth and clothing. I was on duty here for two and a half years after the process was first experimented with. During this time I did not hear or know of anything to show that the process was ineffective. Had prepared clothing constantly under my eyes during the whole period. It is water-repellent.

Q. by B. Is there any "stickiness" to the clothing after being submitted to the process?

A. I have never discovered any.

Q. by B. Could you tell if a moth-eaten garment had been injured before or after being submitted to the process?

A. I think not.

Q. by B. Have Cowles & Co. ever returned goods to the arsenal marked "moth-eaten," to designate that they were moth-eaten before having been sent to them?

A. I saw one piece of cloth marked "damaged," and found it was moth-eaten in two places.

Q. by B. As an expert, do you think the ordinary dust which would fall upon goods exposed for several months unbaled and lying loosely around would injure it by the granulated dust cutting the fiber?

A. I do.

Q. by B. Do you think the dust so falling would attract moths?

A. I do.

Q. by B. Do you think that moths at work on this foreign matter might be taken by inexperienced persons as being at work on the cloth itself?

A. I do.

Q. by B. Do you consider that the process of refinishing cloth by heat and pressure would leave it liable to spot by rain?

A. It would, unless sponged afterwards.

Q. by B. If, in this process of refinishing, the direct fire-heat and pressure are sufficiently great to reduce the thickness of cloth one-half, would it injure its strength?

A. I think it would, because there is no way of regulating the fire-heat. It might be scorched without being perceived.

(A pair of trousers was here shown to the witness.)

Q. by B. Do you think that the work of moths on these trousers was done before or after manufacture?

A. I think after.

Q. by B. Do you see any traces of a moth, such as cocoon or other deposit, on these trousers?

A. I do; traces of moths, but no cocoon.

Q. by B. Do you think the process would have washed away these traces other than the ravages?

A. I do.

Q. by B. Do you think the white spot on these trousers might not have been deposited there since the process?

* See p. 35 for these reports.

A. I think it might.

Q. by B. Can you tell whether these trousers have been subjected to the process of Cowles & Co.?

A. No, sir.

Q. by B. From your knowledge of the manner in which business is transacted at the arsenal, do you think it possible that goods might be marked as having been made from cloth prepared by Cowles & Co., which was not so prepared?

A. I think it possible.

(A bundle of overcoats was here presented to the board by Captain Alligood.)

Q. by B. In your opinion do the cocoons or debris here visible on these overcoats come out of the moth-eaten places thereon?

A. I think they do.

Q. by B. Would the process of Cowles & Co. have washed this debris off?

A. I think it would.*

Q. by B. Could the present appearance have been given to the garment by any means since its preparation?

A. I think it could.

On motion, the board adjourned at 3.30 p. m., to meet to-morrow, the 20th instant at 10 o'clock a. m.

SCHUYLKILL ARSENAL,
Friday, December 20, 1872—10 o'clock a. m.

The board met pursuant to adjournment. Present: Colonel R. B. Marcy, Inspector-General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster.

FRANK S. JOHNSTON was then called as a witness and duly sworn.

Question by the board. State your name and position in the military service.

Answer. Frank S. Johnston, chief inspector of clothing, Schuylkill arsenal, Philadelphia, Pennsylvania.

Q. by B. How long have you held this position?

A. Since the 1st of February last.

Q. by B. Are you familiar with the clothing at this arsenal that has been subjected to the process of Cowles & Co., for the purpose of rendering it moth and mildew proof and water-repellent?

A. Yes, sir.

Q. by B. Have you experimented with any clothing submitted to their process?

A. I have.

Q. by B. State the nature and result of such experiments.

A. I experimented with the kersey by cutting large pieces of it, and forming it in a bag and filling it with water. I tried it for ten days, and it never showed any signs of leaking. Then I caused a pair of their prepared trousers to be washed, as a report had come that they emitted a bad smell, after they were worn some time, from the effects of the preparation; also, at the same time, a pair of unprepared, and in my judgment the unprepared emitted a worse smell than the prepared. This was also the opinion of others I called in. I caused to be packed up some of the prepared clothing, together with some of the worst moth-eaten Connecticut blankets I ever saw, I think, in April, this year, but do not know the exact date; and on opening them about two months ago—I think in September—I found no trace of moths on the goods so packed away. I also called on the master-packer to show me, and open in my presence, two bales of clothing that had been submitted to this process, and marked, he said, a year ago, and stowed away; and on a careful examination I found no traces of moths.

Q. by B. Do you inspect or superintend the inspection of all clothing given out of the arsenal to Cowles & Co. as well as others, and all received back?

A. I do.

Q. by B. Do you think it probable, or even possible, that in giving out such clothing some garments may have been included that were already moth-eaten?

A. I don't only think it, but I know it, unfortunately; for the reason that a great many of those coats are and were badly moth-eaten before I came here, hardly any being exempt from it, and in giving my directions to the assistants that I had, and knowing the coats to be so moth-eaten, I directed them to choose the best, in their judgment, and not to send any that were badly eaten. My reasons were, that some were so slightly eaten that it would do them no harm, and that it would save money to the Government by not throwing them aside.

* See his correction of these statements, p. 15.

Q. by B. Is your report of October 4, 1872, to Captain C. A. Alligood, M. S. K., U. S. A., correct?*

A. No, sir.

Q. by B. State in what particulars.

A. I wish to correct the statement that I found moths at work on the trousers. I should have stated that I found live moths, but cannot say they were at work, and that I did not find a great many moths in the overcoats, but that I found many coats moth-eaten and a few moths, one of which I knew to be alive. I do not know whether the remainder were alive or not.

Q. by B. Can you tell by examining the articles whether damage by moths has been done before or after the process of Cowles & Co.?

A. I have never made any observation on this point. I do not think so. In either case the moth-trace would be the same, I think.

Q. by B. In your judgment, were the garments you examined in the arsenal, by direction of the military store-keeper, and found unfit for issue, rendered so by the action of moths subsequent to their having been prepared by Cowles & Co.

A. No, sir; I do not think they were.

Q. by B. Why do you think the damage by moths was not done after the garments had been prepared by Cowles & Co.?

A. Because I have great faith in the preparation, and so many coats were badly moth-eaten before they were sent to them; and in fact there are very few coats in the arsenal that I would like to say are free from some action of moths.

Q. by B. Do you think that the trousers now before the board could have passed through the various hands if the material was moth-eaten before being made up?

A. They could. My reasons for so stating are these: that while I was an assistant inspector at this arsenal, during the war, a portion of the time, pantaloons were brought to me to inspect that had passed through the hands of the cutters and cloth examiners with imperfections in them to which these are mere shadows. Some of these trousers, nearly all, are from the firm of Rockhill & Wilson, to whom they were given by contract previous to my coming here.

Q. by B. Have you certain means of knowing that the trousers exhibited, or the material thereof, have been subjected to the process of Cowles & Co.?

A. No, sir; I do not know whether the cloth from which they have been made had been prepared by Cowles & Co.

Q. by B. Who inspected these trousers when they were received at this depot?

A. I do not know.

Q. by B. Have you any means of determining how long these trousers were in the hands of persons outside the arsenal?

A. No, sir.

Q. by B. Is it probable that any of your assistants would have passed these trousers without having seen the moth-holes?

A. Very; for the reason they have passed things much more glaring.

Q. by B. Do you know of any unprepared garments having passed the assistant or deputy inspectors, which you afterward discovered to have large holes in them? If so, state the instances.

A. Yes; I have known glaring cases of it.

Q. by B. Do you know of any garments prepared by the process of Cowles & Co. which have been in actual use; and, if so, what is their condition?

A. I know of the great-coats that were given out to the watchmen, and examined them in my room carefully, and found them to be in good condition, and not to have lost color at all, no more than any other garment.

Q. by B. How do you account for the fact that recently-prepared goods exhibited traces of moth, while other garments, prepared previously and exposed much longer, are undamaged?

A. I don't know how to account for that. It may be that some portion of the clothing was not prepared as well.

Q. by B. Could it be accounted for by the fact which you have already stated, that the goods were so damaged before having been subjected to the process?

A. Yes.

Q. by B. Have you tested the strength of the prepared goods, as compared with unprepared goods of the same quality; and, if so, with what result?

A. I have, in presence of Captain Rodgers, and I was astonished to find that the prepared goods withstood much more than the unprepared.†

Q. by B. Were you ordered to visit Cowles & Co.'s factory to examine certain coats and kersey, which they alleged were sent them in a moth-eaten condition?

A. Yes.

* See this report, p. 20. Mr. Johnston informed the board that he did not write the report in question, but signed it; and afterward discovered that it incorrectly stated the facts in the manner he pointed out.—G. A. C. & Co.

† Tested by the official machine.

Q. by B. Do you think the garments and kersey were injured before having been sent to Cowles & Co., or since they had left the arsenal?

A. Before.

Q. by B. Are there imperfections in the $\frac{1}{4}$ cloth before being sent to Cowles & Co.?

A. Yes.

Q. by B. What amount of cloth "tare" has usually been allowed to the cutters to cover these imperfections?

A. An eighth of a yard to each imperfection to outside cutters, but nothing to cutters inside the arsenal on prepared goods. The allowance is made to all on unprepared goods. The cloth is tagged or marked, to indicate imperfections, before being sent to Cowles & Co. The outside cutters claim the tare afterward, the same as on unprepared goods; but in the arsenal it has been found that the process has the effect of closing up all little holes, so that the cloth is cut without loss, making an average of about ten per cent. difference.

Q. by B. Is it possible that unprepared cloth might be given out through inadvertence, or any other cause, and made up as prepared cloth?

Q. Yes, very possible.

Q. by B. What is the effect of the refinishing process of Brantley & Leach upon the prepared goods; does it, in your opinion, add to the appearance, strength, or durability of the goods so refinished; do you consider it necessary?

A. The great heat of the irons applied would, I think, in a measure, impair the qualities given by Cowles & Co.'s process. While it would improve the appearance of the cloth, it would detract from its durability. I do not regard it as necessary. It would cause it to spot by rain or water falling on it.

Q. by B. Would or would not the necessary pressing the garments by tailors' irons have a tendency to render the Cowles process futile?

A. No, sir. It would not undergo the same process or the same heat.

Q. by B. Does the process render clothing or fabrics any more liable to spot or become discolored by use?

A. It does not; rather the contrary.

Q. by B. Does the preparation lose its properties by time?

A. As far as my observation goes, it does not.

Q. by B. From your knowledge and observation, do you think the process a preventive in any degree from the ravages of moths?

A. I do most assuredly.

Q. by B. Have unprepared goods been switched and shaken in the same room where unbaled prepared clothing was lying loosely about?

A. Yes, and the floss from the unprepared garments would thus fall on the prepared ones.

Q. by B. Would this fluff, or dust, furnish food for moths, which might be afterwards found on prepared goods?

A. Yes.

Q. by B. To what extent have you observed this fluff on clothing and in the rooms?

A. So that I could pick it up with my finger and thumb. I could scrape it up readily with my hand.

Q. by B. Has your opinion in regard to the process been uniformly as expressed to-day?

A. It has always been the same.

THOMAS S. REESE was then called as a witness and duly sworn.

Question by the board. What is your name and position?

Answer. My name is Thomas S. Reese, and I am chief clerk to Colonel L. C. Easton, Assistant Quartermaster-General.

Q. by B. If you have not already, will you please look over the printed statement on page 18 of the pamphlet before you, and state whether it is, as far as your recollection of the facts goes, a correct *résumé* of the evidence elicited in the examination which it details?*

A. I have read this report, and I have also seen the original report in manuscript of which this purports to be a copy, which I read the day after the investigation, and which gives a fair statement of what occurred during the investigation. I wish further to state that, in making the statement I have just made, I do not wish to be considered as assenting to any deductions or inferences drawn by Messrs. Cowles & Co. unfavorable to Captain Alligood's view of the case.

The board then, at 3 p. m., adjourned until Monday morning, the 23d instant, at half past 10 o'clock a. m.

* This was a communication from Cowles & Co. to General Easton, giving a *résumé* of the evidence taken by that officer in presence of Mr. Reese, dated November 5, 1872, headed "Official examination at the arsenal," and will be found at p. 24.

SCHUYLKILL ARSENAL, PHILADELPHIA, PA.,

Monday, December 23, 1872—10.30 a. m.

The board met pursuant to adjournment. Present: Colonel R. B. Marcy, Inspector General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster.

The board then proceeded to make a careful examination of the prepared clothing at the arsenal.

Captain C. A. ALLIGOOD, military store-keeper, was then recalled.

Question by the board. State to the board any further circumstances that may have come to your knowledge since your previous examination.

Answer. I have since discovered more moth-eaten goods that I desire to present to the board, on which evidences of the moths and the moths themselves have been found apparently at work. [The witness here presented five bundles of overcoats, of five each, twenty five in all; also four pairs of trousers, some of which had before been shown, and all were carefully examined by the board.] I think the process of Cowles & Co. would have washed away the evidence of moths on one pair of trousers.

Q. by B. Are you prepared to state positively that the trousers you have shown were made from cloth subjected to the process of Cowles & Co.?

A. I am prepared to state that they are so marked. The marks indicate it, and they are put on in the regular routine of business, and I believe them to be correct. I do not personally examine the material and clothing that go out and come in this place; nor do I go to Cowles & Co.'s factory to see that they prepare all the goods delivered to them.

Q. by B. Where and by whom is the stamp put on the garments made at arsenal?

A. In the packing-room, and by the gang under charge of Mr. Preston.

Q. by B. Is any precaution taken to guard this stamp from improper use?

A. Not that I know of. No unusual care is taken of it.

Q. by B. Do you think it probable that in some instances the tailors who make up the garments outside the arsenal might have changed the prepared cloth put into their hands for unprepared cloth, which they purchased at low rates?

A. I hardly think it possible. I think it not probable.

Colonel LANGDON C. EASTON, Assistant Quartermaster-General, was then called as a witness and duly sworn.

Question by the board. Were the trousers upon which, as stated in your report to the Quartermaster-General, you found moth-eaten traces, after the garments were prepared by Cowles & Co., stamped in the same manner as those now shown to you?

Answer. I do not know anything personally. All I know is the reports that were made to me from time to time from the arsenal, that all material from which pants are made is prepared by Cowles & Co. before the garments are made. The pants which I referred to in my report bore the stamp of Cowles & Co.'s preparation, but were stamped at the arsenal, like those now shown me. I was under the impression at the time I made my report of November 22d that all garments were stamped by Cowles & Co., but since that time I have learned that the pants are stamped at the arsenal.

Q. by B. What was the appearance of the moth you saw at work upon one pair of those trousers?

A. The moth that I saw was a live moth, on the immediate edge of a hole about the size of a small pea, and there were little specks about the moth and hole, which convinced me that the moth had made the hole. The moth was a worm with no covering.

Q. by B. What evidence was there that the moth was at work?

A. No evidence except that which I have already stated.

Q. by B. Should you discover moth-ravages upon clothing that had been treated by Cowles & Co., do you know of any way to determine whether the damage had been done before or after the treatment, provided no moths were found at work upon the clothing?

A. I do not know of any.

Q. by B. What induced you to believe that the moth-traces you saw upon the other trousers reported were made after they had been subjected to the company's process?

A. Mr. Cowles took me all through his establishment, and explained to me fully the process of preparing goods. The pants I refer to—three pairs—were eaten round and along a twine string. I do not think, from his explanation to me, that that string could have been on when they were prepared. I inferred from that, that the clothing was eaten after it was prepared.

Q. by B. Did the Quartermaster-General forward you, for examination, a communication signed by Messrs. George A. Cowles & Co., and dated October 19, 1872?

A. I don't recollect the date of it. He forwarded me a communication of Cowles & Co. with his instructions to make a personal investigation of the question.

Q. by B. In that communication the following statement occurs: "With regard to the fifteen pairs of trousers, which it is alleged have been found moth-eaten, we think it possible some of them have been attacked by moth; and we can only account for it by supposing that they must have been imperfectly saturated in some spots with the fluid preparation, and that the moths, which infest the rooms in the arsenal, where the woolen goods are kept, may have discovered these weak spots. We have said it is possible that a few garments, some half a dozen or so, may have been injured by moth; and that this could be accounted for upon the theory of some spots having been imperfectly saturated. Employing, as we do, a large number of workmen, unskilled as well as skilled, it presents a remarkable evidence of the faithfulness with which they have discharged their duty, when so trifling a percentage is found of incomplete work. It may have been no fault of the workmen, but from causes which it is impossible to guard against even with the utmost vigilance. It is no easy matter to soak goods so that every thread and fiber shall be thoroughly impregnated. We leave the goods for hours in the solution, and have them thoroughly kneaded in the fluid. After this they are partially dried by machinery, which makes no less than 900 revolutions a minute, and it is possible the fluid may in some instances be thrown off the cloth. How very slight must be this danger may be judged from the fact that so trifling a number of garments are even charged with being imperfect." In your report to the Quartermaster-General of the 22d of November, 1872, you say: "But I see no reason why, if it (the process) perfectly protects a part of the garments, it should not protect all." Please explain if by this you mean to be understood as denying the theory advanced by Messrs. Cowles & Co., as to the possibility of imperfect saturation; and, if so, state your reasons therefor.

A. From my knowledge of the process of Cowles & Co., as exhibited to me by Mr. Cowles himself, I don't believe there is any portion of the garment imperfectly saturated, unless by neglect. Believing that all the goods are perfectly saturated by the process, I believe the grounds taken by Cowles & Co. in that report do not hold good.

Q. by B. In your communication to the Quartermaster-General of the said 22d November, 1872, you state, with reference to a protest you say you received from Messrs. Cowles & Co. against permitting cloth prepared by them to be subjected to the process of refinishing as is done by Messrs. Brantley & Leach, "from what I know of this mode of refinishing, I do not see how it can impair the moth-repellent properties of goods prepared by Messrs. Cowles & Co." Will you please state if by this you desire to be understood as declaring that the action of direct fire-heat cannot injure the chemical results of Messrs. Cowles & Co.'s process; and also state what the chemical re-agents used by Cowles & Co. consist of, and your reasons for the conclusions you arrive at that these re-agents cannot be thus impaired.

A. I can only give my opinion, which I did in my report. From the process of Brantley & Leach, as explained to me by them, I don't think any cloth is subjected to sufficient heat to damage the preparation of Cowles & Co. I know nothing of the ingredients of Cowles & Co.'s preparation. I don't think that any of the cloth made up into overcoats or trousers has been subjected to the refinishing process.

FRANK J. ALBRIGHT was then called as a witness and duly sworn.

Question by the board. State your name and position at this arsenal.

Answer. Frank J. Albright. I have charge of issuing supplies here.

Q. by B. Have you ever found live moths on trousers prepared by Cowles & Co.?

A. Yes, sir; three or four.

Q. by B. State what the condition of these moths were; that is, were they naked worms or not?

A. They were naked worms—also in the cocoon.

Q. by B. What was the extent of the ravages?

A. One pair of trousers had a hole through them. The others were eaten tracks, the nap was eaten off; one had a hole in it about the size of a pea, and tracks about it, and there were eggs there.

Q. by B. What is a cocoon?

A. I call a moth-cocoon the furze of the cloth, in which he covers himself and lives.

Q. by B. Does that furze differ from the furze formed on the floor and about the room; and, if so, in what respect?

A. It does not, though I have found white cocoons there. I have also seen blue cocoons on white goods. The cocoons I found on the trousers were the color of the trousers—were blue.

Q. by B. Was the nap eaten off immediately over the cocoon, or was the cocoon immediately over or near the hole. If so, state the exact pair of trousers, and when you saw them?

A. The one that had the hole in it had a naked worm hanging to the hole, and also had cocoons with worms in hanging to it in different places where the trousers were eaten.

Q. by B. Do you positively know of your own knowledge that these trousers had been prepared by Cowles & Co.?

A. They had the stencil on them. It was a red mark, such as those now shown me.

Q. by B. To whom did you give the trousers you have referred to?

A. I called Mr. Barr's attention to them in the first place. He sent for the chief inspector, Mr. Johnston, who examined them.

Q. by B. How many pairs of trousers did you find eaten?

A. I found four that I know Mr. Johnston got, all marked in the same way.

Q. by B. What other prepared garments have you found moth-eaten?

A. In mounted overcoats—these now upon the table.

[The coats shown by Captain Alligood, and examined by the board.]

Q. by B. When did you find them?

A. Yesterday. I was over here, and Captain Alligood asked me to get him the coats.

Q. by B. Where did you get them?

A. In the southwestern wing of the building.

Q. by B. Did you go alone to get the coats?

A. No, sir; I went with the stable boss—no one else.

Q. by B. Have you constant possession of a key to the room?

A. Yes, sir; to all the rooms of the new building. I keep it in my drawer. When I am away, anybody in my department can go and get it, and get out anything they want.

Q. by B. Could not the worms and cocoons and other evidences of moths have been placed on these garments without having originated there?

A. It could be done.

GEORGE W. KESSLER was then called and duly sworn.

Question by the board. What is your name and position in the arsenal?

Answer. George W. Kessler; I am a packer here.

Q. by B. What articles, if any, prepared by Cowles & Co., have you found or seen at this arsenal that were damaged by moth, and to what extent?

A. I have seen them on trousers in getting them out for issue—two live moths. One was a naked worm, and the other in the cocoon. They had eaten the wool off to the thread, and there was a hole in one; I cannot say that they were at work when I saw them; I can't say how extensive the damage was; I saw some on another lot of trousers; I can't say how many. They were eaten all round the string.

Q. by B. Do you positively know of your own knowledge that these trousers had been prepared by Cowles & Co.?

A. No, sir; they bore the stamp of Cowles & Co., such as on those now shown me. [The trousers had the arsenal stamp.]

WILLIAM PRESTON was then called as a witness and duly sworn.

Question by the board. What is your name and position in the arsenal?

Answer. William Preston; master packer.

Q. by B. Have you ever personally made tests of clothing prepared by Cowles & Co.?

A. No, sir.

Q. by B. Have you ever found moth-ravages on clothing prepared by that firm?

A. Yes, sir.

Q. by B. Do you think the ravages were done after being prepared?

A. That would be a hard matter for anybody to answer and stick to the truth. I know of no evidence that would make it clear to my mind without seeing them actually engaged.

Q. by B. Have you ever seen any live moths at work on clothing prepared by them? If so, describe the moth and extent of damage.

A. There was one pair of pants found by the workmen with a moth embedded where a hole was, and which I thought did the damage. I can't say positively, but it looked so to me. The moth was a small worm in a cocoon, and fast to the garment. The hole was small, and the cloth was eaten about the size of the end of my finger. This is all the case I know. I have seen cocoons on overcoats and the linings, principally on the linings, but cannot say they had been at work.

Q. by B. What was the color of the cocoons you saw on the linings of the coats?

A. They were different colors—some blue, some of a lightish color.

Q. by B. Do you positively know that the pants on which you saw the moth had been submitted to Cowles & Co.'s process?

A. No.

Q. by B. Were they stamped like those now shown you? [These were stamped with the arsenal stamp.]

A. Yes, sir.

Q. by B. Is that stamp put on at the arsenal?

A. Yes, sir.

Q. by B. By whom?

A. By persons under my direction.

Q. by B. Is the stamp secured in any way?

A. It lays in the drawer of the table where used. It is not kept locked. It is accessible to between thirty-five and forty men, who are in the habit of being in the room where it is used.

Q. by B. How many prepared coats and garments have been examined, brushed, and baled?

A. I cannot state exactly, but at least forty thousand.

Q. by B. Do you think clothing prepared by this process possesses marked advantage over clothing not prepared?

A. I do. Ravages of moths are usual in unprepared goods; but not so in the prepared goods. On the recent discovery of a moth on the prepared goods, I made the remark that I thought some one was tampering with the acids of the preparation. I have been for five years in my present position, and have been continually handling Government clothing. I think a large amount of clothing has been saved by the preparation, most undoubtedly.

Q. by B. About what percentage or number do you think you have found injured in the prepared goods brushed and baled?

A. It would not be one in a thousand. From the 4th to the 18th of this month 5,775 were brushed and put away. Among these I found 18 that bore traces of moths, of which the inspector only condemned one.

Q. by B. Was there anything to show whether these 18 coats were damaged before or after being prepared?

A. No, sir; nothing that I could see.

Q. by B. How long has the pile of coats the board examined this morning been piled loosely in the arsenal?

A. I think since about the middle of June last.

Q. by B. Do you think it judicious to leave clothing lying loosely about in the arsenal?

A. I do not.

Q. by B. Would not the granulated dust falling on it injure the fiber?

A. It might rub some of them, which might have the appearance of moth-work.

NATHANIEL BARR was then called as a witness and duly sworn.

Question by the board. State your name and position at the arsenal.

Answer. Nathaniel Barr; general receiver, warehouseman, and issuing-clerk.

Q. by B. Have you ever seen moths on goods, cloth, or clothing prepared by Cowles & Co.?

A. I have seen moths, but no ravages of them around the moth.

Q. by B. Do you know that condemned unprepared kersey has been sold from this arsenal to persons in the city?

A. I do.

Q. by B. In what quantities?

A. Large quantities—50,000 yards at one time.

FRANK S. JOHNSTON was then recalled.

Question by the board. Is there any precaution taken to secure the stencil-plate used in the arsenal in stamping goods, or could evil-disposed persons within the arsenal use the plate without liability of detection?

Answer. There is no precaution that I know of. Persons could use it, I think, without detection.

Q. by B. What security is there that outside contractors, who cut and make up trousers, &c., return the same cloth issued to them?

A. None that I know of.

Q. by B. Could outside contractors obtain damaged cloth in the market at reduced prices?

A. If they felt so disposed. I haven't the slightest doubt they could.

Q. by B. How long have you known outside contractors to keep the cloth intrusted to them by the arsenal authorities before returning the clothing ordered?

A. Over ten months.

Q. by B. Were all "blouses" sent to Cowles & Co. for preparation by their process marked by that firm with a stencil-plate? State the size of the plate, and whether, in your opinion, the stamp would be likely to be cut away, so as to leave no trace of it in reducing the size of the blouses, to fit the men by the Army tailors?

A. Those I saw were. The plate is about five inches by four. I don't think the stamp could be so cut away.

The board then, at 4.10 p. m., adjourned, to meet at the Continental Hotel at 10 a. m. to-morrow morning, 24th instant.

CONTINENTAL HOTEL, PHILADELPHIA, PENNSYLVANIA,
Tuesday, December 24, 1872—10 o'clock a. m.

The board met pursuant to adjournment. Present: Colonel R. B. Marcy, Inspector-General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster.

NEAL CAMPBELL was then recalled as a witness.

Question by the board. Do you know if kersey, sold by the arsenal authorities, has been purchased at reduced prices in the market by contractors cutting and making up army trousers?

Answer. Yes, sir; I know of that having been done.

Q. by B. If kersey, sold as stated, was sponged and made up by the contractors, could it be distinguished from the kersey given out to them from the arsenal; and if so, how would you distinguish it?

A. I don't think it could be, unless the color were different.

Q. by B. You have said you wished to correct your testimony given before. State what corrections you wish made.

A. I was asked the question if washing a piece of kersey with moth-marks on it would remove the debris. I answered I thought it would; but, after consideration, the goods being only soaked in preparation, I do not think it would remove it.

Q. by B. In your long service at the arsenal, before the preparation of Cowles & Co. came into use, did you find clothing damaged by moths, from time to time? and, if so, state whether in large or limited quantities.

A. I did. I may say that large quantities were damaged.

Q. by B. Can you state the amount of clothing, condemned on account of damage from moths, sold during your service at the arsenal?

A. I cannot tell the amount, but I know there were large quantities of all kinds of woolen clothing.

Q. by B. Do you think the trousers shown you, with the moth-cuts on them, could have passed the cutters, makers, and inspectors, in being manufactured, without the moth-cuts having been discovered?

A. Yes, sir; I feel certain that they could, as one leg was longer than the other, which would have been more easily discovered than the moth-work.

Messrs. Cowles & Co. were here asked if there were any persons they wished examined, or papers they wished to submit to the board; in response to which they stated that they had no witnesses to offer, and submitted a printed pamphlet, which is hereto appended.

The board then proceeded to further examination of the papers submitted by the Quartermaster-General.

Having completed the examination of the case so far as it can be made at this place, and desiring to procure further testimony accessible only at Washington, the board adjourned to meet at that place on Monday, the 30th instant, at 10 o'clock a. m., subject to the approval of the Secretary of War.

WAR DEPARTMENT, WASHINGTON, D. C.,
Monday, December 30, 1872—10 o'clock a. m.

The board met pursuant to adjournment. Present: Colonel R. B. Marcy, Inspector-General; Colonel Rufus Ingalls, Assistant Quartermaster-General; Captain J. G. C. Lee, assistant quartermaster.

The president then submitted the approval of the Secretary of War of the adjournment of the 24th instant.

The recorder submitted a letter from Colonel L. C. Easton, Assistant Quartermaster General, in charge of the Philadelphia depot, dated December 24, 1872, with inclosures.

CHARLES EBERT was then called as a witness and duly sworn.

Question by the board. State your name and the position you occupy.

Answer. Charles Ebert. I am a clerk in the Quartermaster-General's Office, in charge, under General Bingham, of the records and correspondence of the clothing branch.

Q. by B. State what amount of clothing, as shown by the records, has been sold at Schuylkill arsenal, Philadelphia, and Jeffersonville depot, for two or three years past, on account of damage by moths.

A. The information desired is contained in this statement, (paper handed board by witness and appended to proceedings, marked "D,") except 1872, which cannot be definitely ascertained from the reports.

Major J. D. Bingham, in charge of the clothing branch of the Quartermaster-General's Office, submitted, by request of the board, the statement hereto appended, marked F. The board then made up its report and adjourned *sine die*.

R. B. MARCY,
Brevet Major-General, Inspector-General U. S. A., President.
RUFUS INGALLS,
Brevet Major-General, Assistant Quartermaster-General U. S. A.
J. G. C. LEE,
Brevet Lieutenant-Colonel, Assistant Quartermaster U. S. A., Recorder.

D.

Statement showing, as far as can be ascertained from the records of the clothing supply branch, the quantities of moth-eaten woolen garments sold at the depots at Philadelphia and Jeffersonville, in 1869, 1870, and 1871, and the original cost of the same.

1869.

At Jeffersonville:

1,260 yards blue lace.	
849 sack-coats, lined, \$4.80	\$4,075 20
1,494 sack-coats, unlined, \$4	5,976 00
62 uniform jackets, cavalry, \$9.25	573 50
38 uniform jackets, artillery, \$9.25	351 50
136 great-coats, foot, \$12	1,632 00
575 great-coats, mounted, \$14.50	8,337 50
49 pairs trousers, foot, \$4.75	232 75
634 pairs trousers, mounted, \$5.90	3,740 60
254 pairs stockings, 48 cts.	121 92
17,750 wool blankets, \$7	124,250 00
72 sashes, \$2.60	187 20
Total	<u>149,478 17</u>

At Philadelphia:

21,268 blankets, woolen, \$7	\$148,876 00
89 forage-caps, \$1	89 00
50 sack-coats, all kinds, \$4.80	240 00
44,972 uniform coats, all kinds, \$12.50	562,150 00
409 great-coats, mounted, \$14.50	58,130 50
11 great-coats, foot, \$12	132 00
2,146 pairs trousers, foot, \$4.75	10,193 50
82 pairs trousers, mounted.	
92 uniform jackets, \$9.25	483 80
24,376 pairs stockings, 48 cts	11,700 48
Total	<u>791,995 28</u>

1870.

At Jeffersonville:

6,449 woolen blankets, \$7	\$45,143 00
449 forage-caps, \$1	499 00
59 uniform jackets, all kinds, \$9.25	545 75
1,269 uniform coats, all kinds, \$12.50	15,862 50
1,506 great-coats, \$14.50	23,142 00
918 pairs trousers, foot, \$4.75	4,360 50
324 pairs trousers, mounted, \$5.90	1,911 60
13 shirts, flannel, \$2.32	30 16
64 pairs stockings, 48 cts	30 72
450 chevrons.	
Total	<u>91,525 23</u>

At Philadelphia :

1,587	woolen blankets, \$7	\$11,109 00
1,156	uniform coats, all kinds, \$12.50	14,450 00
59	great-coats, mounted, \$14.50	855 50
29	great-coats, foot, \$12	348 00
441	sack-coats, lined, \$4.80	2,116 80
4	sack-coats, unlined, \$4	16 00
211	forage-caps, \$1	211 00
24	corde and tassels, all kinds.	
15,011	uniform jackets, all kinds, \$9.25	138,851 75
1,049	shirts, flannel, \$2.32	2,433 68
145	pairs trousers, mounted, \$5.90	855 50
4,167	pairs trousers, foot, \$4.75	19,793 25
Total		<u>191,040 48</u>

1871.

At Jeffersonville :

254	forage-caps, \$1	\$254 00
127	uniform coats, \$12.50	1,587 50
61	uniform jackets, \$9.25	564 25
300	great-coats, all kinds, \$14.50	4,350 00
924	sack-coats, lined, \$4.80	4,435 20
78	sack-coats, unlined, \$4	312 00
1,888	pairs trousers, foot, \$4.75	8,968 00
1,596	pairs trousers, mounted, \$5.90	9,416 40
2,762	shirts, flannel, \$2.32	6,407 84
1	knit shirt, \$2.25	2 25
11	sashes, \$2.60	28 60
22,092	pairs stockings, 48 cents	10,604 16
500	chevrons, all kinds.	
2,013	blankets, wool, \$7	14,091 00
53	corde and tassels, all kinds.	
Total		<u>61,021 20</u>

At Philadelphia :

3,672	uniform coats, all kinds, \$12.50	\$45,900 00
2,193	pairs trousers, foot, \$4.75	10,416 75
1,139	pairs trousers, mounted, \$5.90	6,720 10
1,300	uniform jackets, all kinds, \$9.25	12,025 00
2,819	flannel shirts, \$2.32	6,540 08
206	great-coats, mounted, \$14.50	2,987 00
4,277	great-coats, foot, \$12	51,324 00
2,959	sack-coats, lined, \$4.80	14,203 20
94	sack-coats, unlined, \$4	376 00
76	artillery caps, \$1	76 00
300,000	pairs stockings, 48 cts	14,400 00
Total		<u>164,968 13</u>

The percentage of moth-eaten stockings cannot be given ; 300,000 were sold in all.

1872.

The proportion of moth-eaten clothing sold at the depots at Philadelphia and Jeffersonville cannot be ascertained from the inspection reports, but it is probably the same as in 1871.

Respectfully submitted.

CHAS. EBERT, *Clerk.*

QUARTERMASTER-GENERAL'S OFFICE, December 30, 1872.

Official:

J. D. BINGHAM,
Quartermaster, United States Army.

The following extract from a standard work, "Harris's Treatise on Insects," published by direction of the Massachusetts legislature, was presented to the board, as an authority to show the habits of the clothes-moth. It will be seen that as soon as the minute whitish caterpillars, (almost microscopic,) break through their egg-shells, they at once proceed to cover themselves in a case or cocoon, made from the fragments of the stuff they are deposited on, and which cover they retain till they burst forth the following spring as winged moths. This covering or cocoon is not digested and spun by the tiniean caterpillar, but is made of the material on which they are hatched, and it undergoes no change in color or texture; being in a measure similar to the mode in which birds build their nests of straw, &c. Consequently, where it was stated by witnesses, in the foregoing testimony, that cocoons of a blue color were found on the linings of the coats, which are a brownish yellow, it is evident that these cocoons were not made from the material of the linings; but that they were either made from the

foreign "fluff" which the chief inspector declared to be lying around the arsenal from the unprepared clothing, or they were blown or switched from the infected and unprepared clothing, which the evidence shows were brushed, beaten, and cleansed in the same room with the prepared clothing; or else they were placed there by design. It will also be observed that the clothes-moth, in its natural state, never leaves its cocoon until it emerges therefrom as a winged moth. Wherever it is seen as a *naked worm*, it is because it has been disturbed and knocked out of its case, and in these instances it does not feed, but in a few days dies. Wherever, therefore, witnesses speak of having seen naked worms, they merely saw caterpillars which had been switched or brushed out of their cocoons, and which had either by accident or design fallen on the exposed clothing, which was "lying loosely about," as the witnesses state. The evidence is cumulative to show that in the unprepared clothing and blankets, which have been stored in the arsenal, large quantities have been badly infected by moths, and that in the cleansing of this unprepared material, the cocoons in all their stages, and the caterpillars, could readily have been wafted, switched, and blown in all directions; thus fully corroborating our statements to the Quartermaster-General.

G. A. C. & CO.

From Harris's Treatise on Insects.

"The tinieans in the winged state have four short and slender feelers, a thick tuft on the forehead, and very narrow wings, which are deeply fringed. They lay their eggs mostly in the spring, in May and June, and die immediately afterward. The eggs (according to Latrielle and Duponchel, from whose works the following remarks are chiefly extracted) are hatched in fifteen days, and the little whitish caterpillars or moth-worms proceeding therefrom immediately begin to gnaw the substances within their reach, and cover themselves with the fragments, shaping them into little hollow rolls, and lining them with silk. They pass the summer within these rolls, some carrying them about on their backs as they move along, and others fastening them to the substance they are eating; and they enlarge them from time to time by adding portions to the two open extremities, and by gores set into the sides, which they slit open for this purpose. Concealed within their movable cases, or in their lint-covered burrows, they carry on the work of destruction through the summer; but in the autumn they leave off eating, make fast their habitations, and remain at rest and seemingly torpid through the winter. Early in the spring they change to chrysalids within their cases, and in about twenty days afterward are transformed to winged moths, and come forth and fly about in the evening till they have paired, and are ready to lay their eggs. They then contrive to slip through cracks into dark closets, chests, and drawers, under the edges of carpets, in the folds of curtains and garments hanging up, and into various other places, where they immediately lay the foundation for a new colony of destructive moth-worms."

Correspondence which led to the creation of the investigating board.

On the 16th of October last we received a communication from General Meigs, inclosing the following reports, and asking us for a reply. At the same time we were notified that General Easton had taken the responsibility of stopping any more Army clothing and equipage being sent to our factory, pending an investigation.

SCHUYLKILL ARSENAL, PHILADELPHIA, October 5, 1872.

COLONEL: In obedience to your instructions of the 30th ult., based upon a verbal report made by me to you on that date, relative to stores found moth-eaten after being prepared by Messrs. Cowles & Co., I have the honor to state as follows:

The stores referred to were prepared by Cowles & Co.

Of the great-coats received from Cowles & Co., from time to time, since last June, I have examined about five hundred; about one-half of this number presents evidence of moth; that is, they are slightly eaten. Many of them had cocoons on, and that peculiar dross or dust seen on moth-eaten goods.

On some twenty or thirty of the coats the larvæ have been found alive, and apparently at work.

I have two of these coats in the office, on which are the cocoons with the moths in the chrysalis state.

Ten of the coats examined have been found damaged to an extent rendering them unfit for issue.

Of about three hundred pairs of trousers prepared by Messrs. Cowles & Co., which had been lying loosely and exposed in an upper room of one of the store-houses for two months past, fifteen were condemned by the inspector as unfit for issue, on account of being moth-eaten. Two pairs of these trousers are badly moth-eaten.

In the same room with these trousers there were about two hundred and thirty-seven (237) garments of different kinds, which had been prepared previously by Messrs. Cowles & Co., and were exposed longer than the above-mentioned trousers, yet no evidence of moths could be found on them.

I am still examining the garments received from Messrs. Cowles & Co., of which several thousands are lying loosely in the store-houses, waiting opportunities to be baled. They are received much faster than they can be baled, owing to the paucity of facilities for baling such large quantities. I will report the result of this examination from time to time.

I inclose herewith the report of Inspector Johnston on this subject.

Very respectfully, your obedient servant,

C. A. ALLIGOOD,

Captain and Military Storekeeper, U. S. A.

Colonel L. C. EASTON, *Assistant Quartermaster-General, U. S. A., Philadelphia.*

CLOTHING DEPARTMENT, SCHUYLKILL ARSENAL, October 4, 1872.

CAPTAIN: In obedience to your instructions of the 27th ultimo, directing me to make an examination of the clothing treated by Messrs. Cowles & Co., I have the honor to report that I have examined, as far as in my power, the articles so treated, and find traces of moth.

Fifteen pairs of trousers, made some time during the last two months, and left exposed, I found moth-eaten; three pairs in several places, two of which I found the moth at work, and the remainder slightly eaten, but not sufficiently to render them unserviceable.

I have also examined the great-coats, and find a great many in which are living moths. I have examined carefully about 600 of these coats, and, notwithstanding I found the living moths in them, yet I have discovered but two coats eaten by the moths, and they so slightly as to be immaterial. I would also call attention to two bales of sack-coats and trousers, which had been left open, and the goods exposed, during the greater portion of last summer. These articles were in the same room and in close proximity to the fifteen pairs of trousers referred to; and yet, upon closely examining them, I find no traces whatever of moths. I have also examined the kersey and coat-cloth treated by Messrs. Cowles & Co.; and while I have been unable to find traces of moths, yet I am of the opinion that some of this material is slightly moth-eaten, which will account possibly for some of the slight traces of moths in the twelve pairs of trousers before referred to. I am led to express my opinion in relation to the kersey, for the reason that it is not examined yard by yard, but as to texture and shade. It is a reasonable supposition that some of this kersey has been slightly moth-eaten, because so many trousers have been condemned and sold on that account. While I do not assert that the kersey was moth-eaten when the fifteen pairs of trousers were made, yet I deem it due to Messrs. Cowles & Co. to give them the benefit of the doubt which exists in my mind. As before remarked, I have not examined all the garments for want of time, and make this report without giving the quantities examined, in order that you may be informed as to the progress so far made, as I know your anxiety upon the subject.

Very respectfully, your obedient servant,

FRANK S. JOHNSTON,

Chief Inspector.

Captain C. A. ALLIGOOD, *Military Store-keeper, U. S. A.*

After having fully investigated the matter, so far as it was in our power, we addressed the following communication to General Meigs, on the 19th of October, handing it to him in person:

217 LEVANT STREET,
Philadelphia, October 19, 1872.

SIR: We have the honor to acknowledge the receipt of your communication, dated the 15th instant, calling our attention to a report which you inclose from the military store-keeper at the Schuykill arsenal, as to certain articles of clothing treated by our process, and referring it to us for remarks thereon.

We have read the report carefully, and have visited the arsenal, and made such examination of the goods spoken of as it was in our power to do, and we think the result justifies us in emphatically stating that the report was made under a misconception of the facts, and a want of information as to important matters affecting them.

So far from the facts bearing against the merits of our process, we feel satisfied that a proper examination of the whole case will demonstrate the extraordinary success of the process and the vast saving to the public property which its application has insured.

The report of the store-keeper alleges that certain great-coats, and some other articles of clothing, were "found moth-eaten *after* being prepared by Messrs. Cowles & Co," and proceeds to make an enumeration thereof, which sums up by stating that a large number of overcoats present evidence of having been eaten by moths; that on "some twenty or thirty of the coats the larvæ have been found alive and apparently at work," and that fifteen pairs of trousers have been condemned by the inspector.

These goods, it is stated, were lying "loosely" and exposed in an upper room, and it is further stated, as an extraordinary fact, that in the same room with these trousers "there were about two hundred and thirty-seven garments of different kinds, which had been prepared previously by Messrs. Cowles & Co., and were exposed longer than the above-mentioned trousers, yet no evidence of moth could be found on them."

Whilst the language of the report seems to distinctly state that the coats were moth-eaten *after* they had been prepared by us, the store-keeper, in an interview we had with him yesterday, disclaimed any intention of charging that the moths had destroyed the coats after we had prepared them, and not before. He assured us that he intended to express no opinion on that point; and we can only say that in justice to us it was unfortunate his language was not more exact in this respect, for as it stands in his report it appears as if he charges us with preparing the coats, and that after we had prepared them they were attacked and injured by moths. If the store-keeper, who has only been a few months in his present position, had been familiar with the facts and the material connected with the clothing stored in the arsenal, he would have known that a very large proportion of the unprepared clothing and cloth on hand was injured by moth; that we have frequently discovered this damage when the unprepared goods were sent to our factory; and that we had in numerous instances, where we had found the goods to be damaged, returned them to the arsenal marked "moth-eaten." This being the case, had he been aware of it when he found the damaged coats, it would perhaps have occurred to him to first ascertain, with reasonable certainty, whether the garments had been properly inspected before they had been sent to us, and if there was any proof to show that the injury by moth had occurred, not "*after*" they had been subjected to our process, but before they had been sent to us.

Upon the matter coming to our knowledge that the store-keeper had reported that some of the stores in the arsenal had been "found moth-eaten after being prepared" by us, we made a critical examination of a lot of coats which had been sent us from the arsenal about four days previously. The lot consisted of 340 great-coats. Of this number we found no less than 98 of the coats moth-eaten, some very badly; and more than one-half of the 98 having holes through the cloth. Here, then, was presumptive evidence, at least, that the coats returned previously to the arsenal, which the store-keeper had afterwards discovered to be moth-eaten, were so before being sent to us, and when in an unprepared state; and this would account for the otherwise extraordinary fact that goods prepared by us, and lying loose in the arsenal for a longer period, exhibited no trace or evidence of moth, as the store-keeper states; while in the same room he found more recently prepared garments with moth-tracks. We do not claim that our process will repair injury already done by moth; and hence, if the goods are sent us already moth-eaten, they will exhibit the holes and tracks previously existing. But we maintain that, if properly saturated, the damage will go no further.

On the 11th instant we called upon the store-keeper, and informing him of the result of our examination of the lot of coats which we had just received from the arsenal, requested that he would visit our factory, and examine the lot himself. He subsequently sent the chief inspector and chief clerk at the arsenal, and they verified our statement as to the number of moth-eaten coats, and that they must have been sent to us from the arsenal in that condition, as they had not been in our possession a sufficient time to have received any injury whatever from moth while in our factory. Up to this time the store-keeper has not reported this matter, as to the condition of the goods sent us from the arsenal, to his superior officer; and we have consequently urgently asked him to do so without further delay.

With regard to the fifteen pairs of trousers which it is alleged have been found moth-eaten, we think it possible some of them have been attacked by moth; and we can only account for it by supposing that they must have been imperfectly saturated in some spot with the fluid preparation, and that the moths which infest the rooms in the arsenal, where the woolen goods are kept, may have discovered these weak spots. But in every instance which the store-keeper showed us the moth worm had died, thus proving that as soon as the minute unprepared spot had been eaten, and the worm had touched the saturated cloth, the preparation killed it.

As for the moths and larvæ said to have been found upon the prepared goods, there is no evidence whatever that they were feeding upon them, with the possible exception above noted, where a spot may have been imperfectly saturated.

The prepared goods, as a rule, have been permitted to lie around the arsenal rooms loose for months; and in the same room with prepared goods unprepared goods are examined, and the moths and larvæ switched out of them falling with the woolen dust on the prepared clothing in the same room and being wafted by the wind to all parts

of the building. The prepared clothing being permitted to lie around loosely and not baled up, the moths ready to lay their eggs deposit them upon the exposed prepared goods or on the floor—anywhere, in fact; and the woolen dust which has been switched and shaken and is deposited by the law of gravitation, forms, no doubt, nourishment for the larvæ wherever it may happen to be. That this is the case is demonstrated by the fact that the moths and larvæ are found in greater numbers on the cotton linings of the exposed prepared goods than upon any other portion of them, and this because the linings are generally uppermost, and consequently receive a larger amount of the woolen dust shaken out of the unprepared goods. It is needless to say that moths do not eat cotton goods, and consequently their being found on the linings is proof that it is this woolen dust which attracts and feeds them. To find larvæ upon the prepared clothing thus exposed is only what might reasonably be expected; while the fact that, notwithstanding this, they do not eat the goods so prepared, proves that, even with this extraordinary test, the clothing is found to be moth-proof.

It is not only that moths are found throughout the arsenal building, because of the large quantity of unprepared goods stored there, but in the cellar of the building there is stored a lot of Connecticut blankets, which General Van Antwerp, the former store-keeper, in a letter to General L. C. Easton, dated July 2, 1872, described as being "*literally alive with moths*," and which the chief inspector informed us yesterday were still there, and in such a condition that, "when shaken, clouds of moths flew out of them."

The windows and doors of this store-house are frequently opened; our prepared goods are suffered to remain in the same building, "lying loosely," for months; unprepared goods are beaten in the same building, and in some instances in the same room; the eggs and larvæ are thus wafted about, together with the woolen dust, and then it is considered extraordinary that larvæ should be found where it has been blown, wafted, and switched. Of all the thousands of garments we have prepared, some 50,000 of them probably lying unbaled at different periods in such an atmosphere, half a dozen or so are found injured; that is, it is alleged the moth has actually been found feeding on them. Our case might well rest here without another word.

We have said it is possible that a few garments, some half a dozen or so, may have been injured by moth, and that this could be accounted for upon the theory of some spots having been imperfectly saturated. Employing as we do a large number of workmen, unskilled as well as skilled, it presents a remarkable evidence of the faithfulness with which they have discharged their duty, when so trifling a percentage is found of incomplete work. It may have been from no fault of the workmen, but from causes which it is impossible to guard against, even with the utmost vigilance. It is no easy matter to soak goods so that every thread and fiber shall be thoroughly impregnated. We leave the goods for hours in the solution, and have them thoroughly kneaded in the fluid. After this they are partially dried by machinery, which makes no less than nine hundred revolutions a minute, and it is possible the fluid may in some instances be thrown off the cloth. How very slight must be this danger may be judged from the fact that so trifling a number of garments are even charged with being imperfect.

In view of the importance of the matter to the Government, and in justice to ourselves, we beg, most respectfully, to ask that a board may be appointed to examine into the facts, and that this board may be composed of the highest officers unconnected with the arsenal, and who will thus have the question before them without bias of any kind from any previous knowledge of the process and its results.

With the highest respect, your obedient servants,

GEO. A. COWLES & CO.

Major-General M. C. MEIGS,

Quartermaster-General, Washington, D. C.

General Meigs informed us that perhaps we might not require a board, and that he would, in order to gather all the facts, refer our statement above given to General Easton, of Philadelphia. We accordingly placed ourselves in communication with General Easton, to whom we officially addressed the correspondence which follows:

217 LEVANT STREET, Philadelphia, October 30, 1872.

SIR: On looking over our letter of the 19th instant to the Quartermaster-General, in reply to his reference of the 15th instant, we find we omitted a statement in connection therewith, which we now make, with the request that it may be considered as a portion of our communication of the 19th.

We desire to state, in any case where it may be shown that goods have become damaged by moth after having been subjected to our process, (which may be the case in the event of imperfect impregnation,) that we will, in all such cases, make a rebate. At the same time we repeat what we stated in our previous communication upon this subject, that even if any goods have been thus damaged, the number is extremely inconsider-

able. And we also beg to say, that we shall take, if possible, greater precautions in future to secure perfect impregnation in every instance, now that we are made aware of the danger.

As it is not charged our process induces moth, and as we are willing to pay a rebate on any goods where our process has been imperfectly applied, and injury by moth has been the result of such imperfection, we, in fact, place ourselves in the position of insurers, so that the Government will only pay for moth-proof work, and therefore runs no risk whatever. We take this occasion to inclose certain affidavits bearing upon the facts submitted in our communication to the Quartermaster-General above referred to.

We have the honor to be your obedient servants,

GEO. A. COWLES & CO.

General L. C. EASTON,

Deputy Quartermaster-General, U. S. A., Philadelphia.

STATE OF PENNSYLVANIA,

City and County of Philadelphia, ss :

On the thirtieth day of October, A. D. 1872, personally appeared George A. Cowles, of the firm of George A. Cowles & Co., of said city, who, being duly sworn according to law, deposes and says, that having been informed that the store-keeper at the Schuylkill arsenal had reported that several of the coats at the arsenal which had been prepared by the preservative process of the said firm presented evidence of injury by moth, he proceeded to the factory of the firm on the sixth day of October instant, and gave directions to the superintendent and foreman employed there to make a personal and critical examination of the garments which might be on hand, and which had been sent to the factory from the Schuylkill arsenal for the purpose of being subjected to the process aforesaid; that the deponent also personally examined the said garments himself, and found a large number of them badly injured by moth; and that deponent positively and emphatically declares and believes, from the short time said coats were in their possession, that they were moth-eaten when sent from the arsenal, as aforesaid, to deponent's factory.

GEO. A. COWLES.

Sworn and subscribed before me this thirtieth day of October, A. D. 1872, as witness my hand and notarial seal.

ALEX. THACKARA,

Notary Public.

STATE OF PENNSYLVANIA,

City and County of Philadelphia, ss :

On this twenty-ninth day of October, A. D. 1872, personally appeared Nelson H. S. Hays, superintendent for the firm of George A. Cowles & Co., of said city, Victor Vierow, William B. Lilly, L. T. Jackson, and J. Collins, foremen for said firm, who, being severally sworn according to law, depose and say that on the seventh day of October, A. D. 1872, according to directions given them by George A. Cowles, of said firm, they commenced an examination of three hundred and fourteen great-coats, mounted, which were delivered to said firm from the Schuylkill arsenal on or about the twenty-seventh day of September preceding, and were prepared by them by the patent chemical process of said firm within five days thereafter, namely, on the second day of October, A. D. 1872; that out of said lot of coats they found one hundred and twenty-six (126) more or less moth-eaten, some of them very badly; that said coats were coats not selected, but were all which happened to be on hand when they made the examination for moths; and further, they severally declare that they have severally and frequently discovered and observed moth-eaten tracks and holes in clothing and material sent from the arsenal before it was prepared by the process of the firm; and that each of deponents hereto is satisfied that the lot of great-coats aforesaid were moth-eaten, as the examination clearly showed, before they were sent from the arsenal to the factory of the firm.

NELSON S. HAYS.

VICTOR VIEROW.

WM. B. LILLY.

LEWIS T. JACKSON.

JAMES COLLINS.

Severally sworn and subscribed before me this twenty-ninth day of October, A. D. 1872, as witness my hand and notarial seal.

A. N. NORTON,

Notary Public.

OFFICIAL EXAMINATION AT THE ARSENAL.

217 LEVANT STREET, Philadelphia, November 5, 1872.

SIR: Having been permitted to be present yesterday at the arsenal while you were examining into the report of the store-keeper, in his communication to you of the 5th ultimo, with reference to the state of the goods at the arsenal which had been subjected to our process, we beg, with great respect, to submit the following remarks thereon, which we desire to go upon the record in connection with our communication to the Quartermaster-General of the 19th ultimo, upon the same subject, and which was referred to you for examination and verification.

In our communication of the 19th ultimo, while generally admitting many of the facts presented by the store-keeper, we took exception to the looseness of his phraseology, and also to the circumstance that he had not presented *all* the facts. Thus we find the store-keeper, on the 5th ultimo, alleging that he had examined a large number of coats, and declaring that he "found them moth-eaten after being prepared by Messrs. Cowles & Co.;" while upon turning to the chief inspector's report of the day preceding, made to the store-keeper, we find it stated that he, the chief inspector, knew that moth-eaten goods had been sent us to be prepared from the arsenal, and that he deemed it due to us to state it was a reasonable supposition that the coats and other garments which were found moth-eaten had been so injured before they had been sent to our factory for treatment by our process; and that he was strengthened in this view of the case by the fact that "two bales of sack-coats and trousers, (prepared by Cowles & Co.,) which had been left open and the goods exposed during the greater part of last summer, were in the same room and in close proximity to the fifteen pairs of trousers, (which exhibited traces of moth,) and yet, upon closely examining them, I find no traces whatever of moths." The chief inspector naturally inferred that when he was aware damaged goods had frequently been sent us, and when he found undamaged goods, prepared by our process, remaining sound and untouched, notwithstanding this great exposure, that it could only be accounted for by the fact that our process was a moth-preventive, and that the injured goods were so injured before they were treated by us. The store-keeper's report makes no mention of the circumstance that injured goods had been sent us, although the chief inspector had reported the fact to him in writing the day previous to the date of his (the store-keeper's) report to you.

In the examination yesterday all the statements in our communication of the 19th ultimo were not only fully corroborated, but some additional facts were developed, which makes our case even stronger than we had presented it. The chief inspector, when examined, stated that, having visited our factory by direction of the store-keeper, and having seen the large number of moth-eaten coats there, which had undoubtedly been sent to us in that condition from the arsenal, many of them in a worse condition than any of the coats which had been found thus far returned by us to the arsenal, he had no hesitation in expressing his conviction that the coats at the arsenal which had been subjected to our process, and exhibited injury by moth, were so injured before they were sent to us. He also stated that he had only seen *four* moths altogether upon the prepared goods at the arsenal, and that these moths were not eating the goods, nor were the coats upon which he saw the moths injured. He further said that he knew of garments passing the deputy inspectors which it was afterwards discovered had large holes in them; so that no inference could be drawn unfavorable to us from the supposition that the damage was too great to escape the observation of the men who inspected the goods sent us.

The store-keeper, in his report to you of the 5th ultimo, alleges that "on some *twenty or thirty* of the coats the larvæ have been found alive and apparently at work." The chief inspector, the day before, reported that he had discovered but *two* coats eaten by moths; and on yesterday he stated that he had only seen *four* moths altogether. The store-keeper, who depended upon the chief inspector's report, alleges there were "*twenty or thirty*."

Two of the gang of workmen employed in brushing and baling the prepared goods, and who have thus brushed and baled thousands of prepared garments, were produced yesterday by the store-keeper to prove that live moths were found "on twenty or thirty coats." To an inquiry from you as to whether they had observed moths on the prepared goods, they answered, "Yes, plenty of them." Upon, however, being pressed by us for a more definite statement, and after much hesitation, one of the men said he had only himself seen *three* moths, whilst the other man had only seen *one* moth. Upon being further questioned as to whether they had not "heard" that some more moths had been seen by the gang of workmen, one of the men declared that he had "heard" that *thirteen* moths in all had been seen; while the other man (they were examined separately) had only "heard" of *ten*. So that the "plenty of moths," when examined into, became three absolutely seen by one of the men, one of the three absolutely seen by the other man, and a tradition that thirteen had been seen in all!

While we did not deny, in our communication of the 19th ultimo, that it was possible

some of the prepared cloth may have been, in consequence of hasty manipulation, imperfectly impregnated by our process, and that the moths, finding the weak spot, attacked it, we were not prepared to learn, as we did yesterday, that this injury could only be directly traced to *one* pair of trousers, and inferentially to two other pairs. In one pair of trousers a live moth was said to have been found at work. When exhibited to us it was dead, having doubtless nibbled beyond the imperfect spot and been destroyed by the prepared portion. The very fact that this one moth had effected a lodgment in a single pair of trousers, not, it was said by the store-keeper in his report, so much exposed as "two hundred and thirty-seven garments of different kinds which had been prepared previously and which were unharmed," is proof to any reasonable and fair mind that our process, perfectly applied, is an absolute safeguard against moth; and the imperfection of impregnation, extending at most to *three* garments, also proves how very little danger there is from that cause. For in all the fifty thousand garments subjected to our process, and about one-half of which have been brushed and baled by the laborers of the arsenal, but *three garments* are shown which there is any fair and honest proof have suffered injury since they were treated by us.

That moth-worms may have been found on our prepared goods we do not deny, but we account for it by showing that the unprepared goods are frequently inspected in the same room with the prepared goods, and that the "dross," and perhaps larvæ, are wafted and blown on our goods, and that the moth-worm may be feeding upon this foreign substance, so wafted and blown. This the chief inspector, the only expert examined, declared might well be the case, and he also acknowledged that our statement was true, that unprepared goods were examined in the same room with prepared goods, and that they were there shaken and tossed about; that he had seen the dross or fluff from the unprepared goods floating about and settling on the prepared goods, upon which it lay in sufficient quantities to be taken up by the thumb and fingers; and that when he saw the moths on the prepared goods *he could discover no injury they were doing to those goods*, and thought it quite probable they were in reality feeding on the unprepared dross or floss which had floated upon them.

As for our assertion that the prepared goods have been suffered to lie around the rooms of the arsenal for months unbaled, we offer a striking proof in the case of the very pair of trousers upon which the live moth was said to have been found. Upon examining the trousers in question, the chief inspector declared he had not cut them. The store-keeper's clerk stated that they were cut previous to March last, and had been then sent to outside contractors to be made, and that they had remained in the hands of these contractors for several months. How long previous to last March the prepared cloth had been in the arsenal could not be ascertained. But the fact remains, that these trousers were never baled up, but for months had been permitted to lie around in the workshop of parties outside the arsenal, or in the arsenal itself. The store-keeper, in answer to an inquiry by you, excused the remissness in baling and using reasonable care in securing the prepared goods from lying loosely around where the dross or fluff and larvæ from the unprepared goods would fall upon them, by saying that as they were prepared goods he did not consider it necessary to take the same care of them that he would bestow upon unprepared goods. We cannot say what treatment these trousers were subjected to in the several months during which they were in a private workshop, out of the custody of the keeper of the arsenal.

The store-keeper acknowledged that of the moths seen on the prepared coats by far the larger number were found on the cotton linings of the coats. We accounted for this in our communication of the 19th ultimo by saying that as the coats were folded these linings were uppermost, and that the "dross" or fluff and larvæ from the unprepared goods fell upon the cotton linings thus exposed, and that it was upon this unprepared "dross or dust" the moths were feeding. We observed that it was needless to remark that moths will not feed on cotton, because we took it for granted that that was not an open question to any one in the slightest degree conversant with the habits of the moth-worm. The store-keeper, however, stated yesterday that while it was undoubtedly true that the greater portion of the moths seen on our goods were observed upon the linings of the coats, yet that he had just made what he termed "a remarkable discovery," which proved that not only would moths eat cotton linings, but they seemed to prefer it. This "discovery" was made, it was alleged, in a box of unprepared coats, which were in a shed outside of the arsenal yard, and which were badly eaten by moths. Upon opening the box, we saw at once the mistake the store-keeper had made. The linings of the coats thus badly eaten were made of a shoddy of wool and hair, and it was this old wool and hair stuff the moths "preferred" and had literally riddled. Upon turning the coats over some were found with the ordinary cotton linings, such as nearly all the Army coats which had been sent to us for preparation are lined with; and here it was found, that notwithstanding the coats themselves had been eaten, notwithstanding the "dross and dust" from the woolen fiber had fallen thickly upon these cotton linings, *not a thread or particle of the lining was eaten*.

It was acknowledged by the store-keeper's clerk that he had sent us frequently, both to our Brooklyn factory and here, bundles of coats in their original bales, without

any inspection beyond what had been given them several months previously for a different purpose.

With regard to the Connecticut blankets, the fact was clearly elicited, after much difficulty, from the person in charge of them, that they had been left exposed and uncovered in the cellar of the building where they were stored, with the doors and windows constantly open, with the men attached to the arsenal continually going in and out of the cellar, or, as the witness expressed it, making a "thoroughfare," till "about six weeks ago," when, for the first time since these blankets were in store, they were covered up and the cellar doors kept closed. The "about six weeks ago," mentioned by the person in charge, coincides with the time when this question of moths upon our goods first arose.

The store-keeper states, at the close of his report of the 15th ultimo, that he "is still examining the garments received from Messrs. Cowles & Co.," and that he "will report the result of this examination from time to time." In reply to your inquiry yesterday, he stated that he had no additional facts to report. So that it appears, with the closest examination, he has been unable to gather a single additional unfavorable result; while, as we have proved, the report already made did us an injustice in the equivocal character of its language, and its marked omission of the important facts contained in the chief inspector's report.

In view of all these facts, and the complete vindication of our process which the examination has disclosed, we beg most respectfully to ask that the work may be resumed. The heavy expense we have incurred by the cessation of work at our factory, while we were compelled to retain under pay the skilled labor which we have educated to the business, we cheerfully bear, when the result demonstrates that the judgment of the Quartermaster-General, in recommending our process, is so fully borne out in the rigid examination now made.

Your obedient servants,

GEORGE A. COWLES & CO.

General L. C. EASTON,

Deputy Quartermaster-General, Philadelphia.

CITY AND COUNTY OF PHILADELPHIA,

State of Pennsylvania, ss :

On this 20th day of November, 1872, personally appeared George A. Cowles and George W. Brega, of the firm of George A. Cowles & Company, who, being duly sworn according to law, depose and say that they were present at the examination held by General L. C. Easton, at the Schuylkill arsenal, on the fourth day of November instant, with reference to the result of the process of George A. Cowles & Co. upon certain cloth and clothing, and that the statements as to said examination contained in the communication to the said General L. C. Easton, dated the fifth day of November instant, are fully, correctly, and truly given therein, to the best of their knowledge and belief.

GEO. A. COWLES.
GEO. W. BREGA.

Sworn and subscribed to before me this 20th day of November, A. D. 1872.

[L. S.]

A. N. NORTON,

Notary Public.

The Quartermaster-General, on the 15th November, forwarded us the following additional report from the store-keeper:

SCHUYLKILL ARSENAL,

Philadelphia, October 21, 1872.

COLONEL: In addition to my report of the 5th instant, relative to moths having been found in clothing treated by Messrs. Cowles & Co., I have the honor to present the following:

I have examined about one thousand (1,000) more of the great-coats, of the same lot referred to in my former report, and have found thirteen coats moth-eaten, and about the same number of live moths on them.

In another lot of trousers—seventy (70) pairs—made of material treated by Messrs. Cowles & Co., ten (10) pairs have been found moth-eaten. Three pairs of these trousers were tied together by a hemp string, and it is along the line of this string that the trousers are eaten. A live moth was found under the string. Cocoons, with moths in them, were also found around the string, on the material, and near the moth-eaten parts.

On another pair of the trousers, from the same lot, I found a hole as large as a pea, eaten through one layer of the cloth, and in this hole a live moth. This pair of trousers was folded up with the moth in the hole on the 11th instant, and remained so folded until the 18th, when the trousers were unfolded for examination by Messrs. Cowles & Co., and the moth found dead.

On the 11th instant Mr. Cowles informed me that among the great-coats in his possession, and not yet returned, a large number was moth-eaten, and requested that I call at his place or send some one to examine them. In accordance with this request, I directed the chief inspector and my chief clerk to visit the factory of Messrs. Cowles & Co., and examine the coats.

On the 12th instant the inspector and clerk called at the factory, and examined three hundred and forty (340) coats, ninety-eight of which were moth-eaten. They also found two (2) pieces of kersey moth-eaten.

These coats, Mr. Cowles alleges, were the last delivered to him.

I immediately ordered an examination of seven hundred and fifty (750) great-coats last received from Messrs. Cowles & Co., and which were of the same lot as those last delivered to him, with a view of ascertaining whether or not there was any such proportion moth-eaten among them.

After a careful and thorough examination of these seven hundred and fifty (750) coats, I found six (6) of them moth-eaten.

Very respectfully, your obedient servant,

C. A. ALLIGOOD,
Captain and Military Store-keeper, U. S. A.

Colonel L. C. EASTON,
Assistant Quartermaster-General, U. S. A.

In reply we addressed this letter to General Easton :

217 LEVANT STREET, PHILADELPHIA,
November 16, 1872.

SIR: Since the date of our communication, which we had the honor of addressing you on the 5th instant, we have been furnished with a copy of a report made to you by the store-keeper of Schuylkill arsenal, dated the 21st October, with reference to our prepared goods, and in continuation of his former reports upon the same subject.

The examination had by you at the arsenal on the 4th instant, at which we were permitted to be present, covered all the points advanced by the store-keeper in all his reports; and our communication to you of the 5th instant fully reviewed and answered them. But this last report of the store-keeper's is open to the same objection which we have made to his previous report, namely, that he has *suppressed* important facts bearing upon the merits of the case, and which, whether designedly or otherwise, has the effect of misrepresenting the matter, misleading the Government, and doing us a grave injury. We feel pained at being compelled thus to designate the store-keeper's report; but there is such a persistency of omission running through all the reports he has made, as to force us, in self-defense, and more than that, in vindication of the truth, to make the charge, and endeavor to support it beyond all controversy.

In our communication to the Quartermaster-General of the 19th October, and in our letter to you of the 5th instant, we pointed out the omissions made by the store-keeper in his report of the 5th October. These consisted of the omission to report the fact reported to him by the chief inspector, that coats and cloth had, to his knowledge, frequently been sent us in a moth-eaten state; that the chief inspector had informed him that while he had seen moths upon the prepared goods, yet, upon examining them, he could not discover that they were feeding upon the goods, or doing them any injury. That while the store-keeper reported he had seen "that peculiar dross or dust seen on moth-eaten goods" lying upon our prepared goods, he omitted to state that unprepared goods were shaken and beaten in the same room with prepared goods, and that the "peculiar dross or dust" was thus shaken and beaten from the goods which were unprepared, so as to be blown or wafted on the prepared goods. That the chief inspector had, in writing, expressed his belief from all the facts, including the fact that prepared goods much longer exposed than those upon which moth-tracks were found were discovered to be uninjured, that the goods so found with moth-tracks were injured before they had been sent us from the arsenal. None of these facts were stated by the store-keeper in his report of the 5th ultimo; and yet their mere statement explains at once the whole matter, and shows why it is that, to quote from the storekeeper's report, "in the same room with these trousers, (which it is alleged presented evidence of injury by moth,) there were about two hundred and thirty-seven garments of different kinds which had been prepared previously by Messrs. Cowles & Co., and were exposed longer than the above-mentioned trousers, yet no evidence of moth could be found on them." The chief inspector had already informed him that moth-eaten goods had been sent to us for preparation, and if the store-keeper had but mentioned this fact in his report to you, it would at once have accounted for the goods so recently prepared exhibiting evidence of being moth-eaten, while much longer-prepared goods were sound and untouched.

In the store-keeper's report to you of the 21st October, and which was sent to us from the Quartermaster-General's Office, since the date of our communication to you of the 5th instant, he makes the following statement, in connection with the examination had

by the chief inspector and his chief clerk, as to the moth-eaten goods in our factory and which we informed him at the time were sent to us in the moth-eaten condition they now present. We give the store-keeper's statement in full:

"On the 11th instant Mr. Cowles informed me that among the great-coats in his possession, and not yet returned, a large number was moth-eaten, and requested that I call at his office, or send some one to examine them. In accordance with this request I directed the chief inspector and my chief clerk to visit the factory of Messrs. Cowles & Co. and examine the coats.

"On the 12th instant the inspector and clerk called at the factory and examined three hundred and forty coats, ninety-eight of which were moth-eaten. They also found two pieces of kersey moth-eaten.

"These coats, Mr. Cowles alleges, were the last delivered to him.

"I immediately ordered an examination of seven hundred and fifty great-coats, last received from Messrs. Cowles & Company, and which were of the same lot as those last delivered to him, with a view of ascertaining whether or not there was any such proportion moth-eaten among them.

"After a careful and thorough examination of these seven hundred and fifty coats, I found six moth-eaten."

These facts, when *all* stated, are as follows: We requested the store-keeper to come to our factory and examine these coats and kersey, stating to him that they were badly moth-eaten, and that they were the last lot which had been sent to us from the arsenal. This request was made on the 11th of October, the coats and kersey having been sent to our factory from the arsenal on the 27th of September previously, fourteen days before we made the request.

In our sworn affidavits, which we laid before you on the 30th ult., our superintendent and foremen swear they examined these goods on the 7th day of October, but *ten days* after they were received from the arsenal, and then found them in the condition they now are; and which you yourself saw upon your visit to our factory on the 5th instant. Our object in requesting the store-keeper to visit our factory and examine these goods was to show him they were moth-eaten, and also, as the important connecting fact therewith, that they had been sent to us so short a time previously, that it was impossible they could have been so injured while in our possession. This latter matter was the important fact, because without this it might be a question, as with the goods returned by us, whether the articles were injured *before* or *after* preparation. When the chief inspector and clerk called at our factory, they exhibited a letter from the store-keeper, directing them to examine the goods, and make a report of the result to him *in writing*.

You will remember that when the chief inspector was being examined by you at the arsenal, on the 4th instant, we asked him if he had made a report in writing of his examination of the goods at our factory. He replied that he had only made a verbal report. We then asked him what he had reported verbally, and he stated he had reported that he had visited our factory and found the goods in question moth-eaten, some of them in a worse condition than any he had seen returned to the arsenal, *and that he was satisfied they were so injured before they were sent to us*. Subsequently the store-keeper's chief clerk produced his book and showed you the entry, by which it was proved the goods in question were sent to us from the arsenal on the 27th September, and that, as we had returned all the goods to the arsenal previously sent us, it was impossible there could be any mistake or fraud in the matter of our statement as to the time when we received these goods.

Compare this full and plain statement with the store-keeper's report. He contents himself by limiting the report made to him verbally, by his agents, to the mere fact that they found the goods moth-eaten, but says not a word as to their report that the goods were in our possession so short a time as to render it a matter of absolute certainty they must have been damaged when sent to us. And he then goes on to give the result of what he alleges an examination of some seven hundred and fifty coats produced, and which, he says, showed but six injured. What does the store-keeper mean by this? Does he mean to be understood, by the suppression of a material, and *the material*, part of his agent's report, and his so-called examination of the coats at the arsenal, to covertly accuse us of *fraud*? Let the affidavits of our workmen, of Mr. Cowles, and our books, and the books of his own chief clerk, answer the insinuation, which he dare not make openly, and which no man who knows us would for an instant believe, even if we had no proof to sustain us.

We have the honor to be, your obedient servants,

GEO. A. COWLES & CO.

General L. C. EASTON,

Assistant Quartermaster-General, Philadelphia.

217 LEVANT STREET, PHILADELPHIA,
November 18, 1872.

SIR: In accordance with your request, we beg respectfully to make a protest, in writing, against permitting cloth prepared by us to be subjected to a process of "refinishing" by heat and pressure, as we believe it would be injurious both to our process and the cloth.

Some six weeks ago we made a verbal protest of the same character to the store-keeper at the Schuylkill arsenal, upon his informing us that certain parties had proposed to him to have the cloth thus "refinished." Notwithstanding our protest, we are given to understand that the store-keeper has permitted the parties in question to use this process of "refinishing" by heat and pressure upon cloth prepared by us, and that a large number of the garments which are being made up are from cloth treated in this manner.

The names of the parties who are having this "refinishing" done are Brantley & Leach.

We have the honor to be, your obedient servants,

GEO. A. COWLES & CO.

General L. C. EASTON,

Assistant Quartermaster-General, Philadelphia.

On the 22d of November we received from the Quartermaster-General an official copy of this report which he had received from General Easton:

DEPOT QUARTERMASTER'S OFFICE,
Philadelphia, Pa., November 22, 1872.

GENERAL: Herewith I have the honor to return the papers relating to some clothing at the Schuylkill arsenal, which has been discovered to be damaged by moths after being prepared by the process of Messrs. Geo. A. Cowles & Co. These papers were referred to me from your office October 23, 1872, for investigation and report; and, in accordance with your instructions, I have given the subject a patient and careful personal investigation.

The facts in regard to this clothing are fully set forth in the reports of Captain C. A. Alligood, military store-keeper, dated October 5th and 21st, and a repetition of them is here therefore deemed unnecessary. These reports are on file in the Quartermaster-General's Office, and attention is respectfully invited to them.

I have personally examined the garments referred to by Captain Alligood, and on one of them—a pair of trousers—I saw a live moth at work. That these trousers were prepared by Messrs. Cowles & Co.'s process there can be no doubt, as they bear the company's stamp. All articles treated by this firm are stamped by them with indelible ink. I have also examined other garments which have been eaten by moth after being prepared by the same company, and which were likewise marked with the company's stamp. The garments here referred to were trousers, and had not been subjected to the "refinishing" process of Messrs. Brantley & Leach. I refer to this for the reason that Messrs. Cowles & Co., in a communication addressed by them to this office on the 18th instant, protest against permitting cloth prepared by them to be subjected to the process of refinishing as is done by Messrs. Brantley & Leach, of this city, who have received prepared cloth from the arsenal to be made up into garments, they (C. & Co.) alleging that it injures their process. From what I know of this mode of refinishing, I do not see how it can impair the moth-repellent properties of goods prepared by Messrs. Cowles & Co.

They also refer to the mode of cleaning clothing at the arsenal, and the consequent exposure of their goods, the unprepared goods being cleaned in the same room with the prepared ones, &c. As regards this, I would simply state that the object of their preparation, as I understand it, is to render clothing moth-proof, absolutely and under all circumstances. If it does this, it is fair to expect that the clothing will withstand any exposure, no matter how great, without injury from moths. If the prepared goods are to be protected with the same care as the unprepared ones, I see no advantage whatever in the process.

In reply to an inquiry from this office, Captain Alligood reports that upon further examination (made since his last report) of great-coats that have been prepared by Messrs. Cowles & Co., about one per cent. have been found injured by moth.

This is a very small proportion, and if we were certain it never would be greater, the process would be a success and protection, as well as an economy, to the Government. But I see no reason why, if it perfectly protects a part of the garments, it should not protect all.

I would state, also, that they, (Cowles & Co.,) in reviewing the reports of Captain Alligood, place much stress upon the fact that there was stored at the arsenal a lot of Connecticut blankets, which were known to be infested with moths, and they attribute to this fact the existence of moths in goods prepared by them, &c. I examined this subject carefully, and found that these blankets were in such a condition and

stored in such a manner as not to endanger any clothing or material at the arsenal. They have since been sold and removed from the arsenal.

Another point raised by Messrs. Cowles & Co., in their report of October 19, and which they argue at some length, is, that clothing sent to them from the arsenal was moth-eaten before they received it, and they claim that it is reasonable to suppose that this was the case with some of the clothing here referred to. It is undoubtedly true, that in some cases moth-eaten goods, overlooked in examination, have been sent to them from the arsenal, but I do not see how this affects the question that moths have been seen at work on clothing *after* being prepared by them.

In view of the favorable reports of Captain Van Antwerp and others on the process of Messrs. Cowles & Co., I hesitate to condemn it, and would recommend that when the warm season again sets in the clothing heretofore prepared by them be thoroughly tested as to its moth-repellent properties, &c. Until the tests here suggested have been thoroughly made and fully reported on, I cannot recommend that any more clothing or material be given them to prepare.

I am, general, very respectfully, your obedient servant,

L. C. EASTON,

Assistant Quartermaster-General, United States Army.

The QUARTERMASTER-GENERAL UNITED STATES ARMY,

Washington, D. C.

To the above report we made the following reply:

OFFICE OF GEORGE A. COWLES & Co.,

217 Levant Street, Philadelphia, November 25, 1872.

SIR: We have the honor to acknowledge the receipt of your letter of the 23d instant, inclosing a report made by General L. C. Easton on the 22d instant, to whom you referred, on the 23d October, our communication to you of the 19th of the same month, in reply to certain reports made by the military store-keeper and the chief inspector of the Schuylkill arsenal regarding prepared clothing stored there.

You informed us at the time that your object in sending our communication to General Easton was in order to have that officer institute an investigation into our statements, and gather all the facts relating to the subject, so as to place you fully in possession of them. How far General Easton's report fulfills these conditions you of course will judge. But, as the parties interested in this matter, we may be permitted to state, most respectfully, that General Easton's report presents no new facts whatever as to the investigation he was directed to make; excludes us from the benefit of the facts which we elicited at the examination he held at the arsenal; and re-affirms the store-keeper's statements, which we disproved under oath, and which the store-keeper, as we show hereafter, failed to prove by his own witnesses.

We regret to find that General Easton not only states, as conceded facts, important matters which were denied and refuted in the most solemn manner under oath, and by the store-keeper's own witnesses, but that he did not deem it necessary to forward to you with his report our written statements, made to him in his official capacity, and with the request at the time that these statements should be placed upon the record as a continuation and part of the case, as presented to you in our communication of the 19th of October last, and referred by you to him.

Not only has he omitted to send these statements, but he also makes no mention of the details of his examination at the arsenal, when we were present, and a report of which we drew up and forwarded to him on the day following the said examination, namely, on the 5th instant, and to the accuracy of which we made affidavit. This examination was an important matter, because we were enabled to elicit the fact that the store-keeper's reports, by systematic concealments, made out an apparent case, which a cross-examination of the store-keeper's own witnesses (and all the persons examined were his witnesses) proved conclusively to be baseless. A suppression of the truth, in law and in morals, with the purpose of doing an injury, is as grave an offense as the deliberate utterance of a falsehood. We proved the store-keeper had been guilty of this continuous suppression of the truth in all his reports; and the examination held by General Easton at the arsenal established it. If we incorrectly reported the proceedings at this examination, our error should have been pointed out. But that we did not do so is seen in the fact that our sworn report is not attempted to be called in question; it is simply ignored, as having no existence, as is our request that it may be made a part of the record. We maintain that, in the report which we have given of the examination at the arsenal, held in our presence, we have stated correctly and fully the facts there developed, and we beg respectfully, but firmly, to submit that when General Easton saw fit to ignore that report, and to give no details himself of the investigation at the arsenal, he did us a grievous wrong.

But General Easton's report is open to even a more serious complaint. He has fallen into the error of stating that the goods were injured to the extent of one per cent. after

having been prepared by us. There was not a particle of evidence taken by General Easton, in our presence, to prove this, nor does he bring forward any such evidence in his report. On the contrary, the only evidence given, or in any way produced, by the store-keeper's witnesses, showed that *one* pair of trousers had been found with a moth upon them, and that two other pairs were exhibited, which it was presumed were injured after having been prepared by us. In our communication of the 5th instant, (which will be found herewith,) we have gone fully into this matter, and we beg to refer to it. We deny in toto that a single fact, beyond what we have officially presented, was proved by the store-keeper in his examination, although he had only his own witnesses examined, and we had to elicit the facts, after much labor, by cross-examination. Yet, although we claim to have refuted the store-keeper's statements, by the simple process of eliciting *all* the facts, General Easton assumes that the store-keeper's reports are true, and quietly puts our examination and affidavits aside, as an easy method of disposing of them, without even recognizing their existence.

General Easton misstates our position, when he assumes that we take the ground that our prepared goods have been moth-eaten because they were exposed to an atmosphere where the floss and dust from the unprepared clothing was wafted and blown upon them. Our statement to you of the 19th October, and our subsequent communications to General Easton, will show we did not take any such ground; and, as we give them below, it can be seen at a glance that our complaint against General Easton in this respect is well founded. What we did state was, that, as the inspector declared he had seen moths on our prepared coats—but four in all—and as he also declared he could see no evidence they had injured the coats upon which he saw them, it was evident they were feeding *not* upon the prepared goods, but upon the floss or dust shaken off of the unprepared goods, in such quantities, as the inspector declared, that it could be taken up by the thumb and fingers. That this was evident, also, from the fact stated by the store-keeper, as well as the inspector, that more moths were seen on the cotton linings than anywhere else, and that, as moths will not eat cotton, they *must* have been feeding on the floss or dust from the unprepared clothing which had fallen on the linings, as they lay uppermost. We cannot believe General Easton took the trouble to read our statements, or he could not have so strangely misunderstood us. As for the trousers upon which General Easton saw the live moth, we adduced proof—the statement of the store-keeper's chief clerk—to show that these very trousers had lain about the workshop of a private firm, outside the arsenal, for months; and that we could not possibly tell, therefore, to what treatment they had been subjected. No reasonable man will contend, we suppose, that our process, or any process, cannot be so ill-used as to destroy it; and we are entitled to the benefit of the doubt which must be felt as to whether it is a *fair* test to take a piece of prepared cloth, and toss it about a private workshop for months, subject to all the vicissitudes of such a condition, and then hold it up to our vision, if it should get a moth on it, as evidence of our failure. While, “in close proximity,” the store-keeper and the chief inspector both acknowledged prepared goods were found exposed for a much longer period, which were wholly uninjured by moth. But these latter goods had not undergone the ordeal of being tossed about for several months in a private workshop outside the arsenal.

As if injustice enough was not already done us, General Easton alludes to our protest against the “refinishing” process of Brantley & Leach, and expressing his opinion that it cannot possibly injure the cloth, reflects upon us for protesting against its use. He declares, that from what he knows of this “refinishing” process he “cannot see how it can impair the moth-repellent properties of goods prepared” by our process. We cannot say what facts General Easton bases this opinion upon, especially as in a former report he states he does not know the chemical re-agents we use. But we do know that the process used by Brantley & Leach consists in heating iron plates so hot by direct fire-heat that they “hiss” when touched by water, and that should this heat be as high as three or four hundred degrees, which it may well be, as no means are adopted to regulate it, it would not only injure our process, but destroy the life of the cloth itself. And that, this being the case, our protest was at least entitled to some consideration, especially as we are held responsible, as in the case of the pair of trousers, for all future damage which may result to the goods, no matter how much they may be abused, injured, or even burnt.

The store-keeper, it is stated by General Easton, in reply to an inquiry from him, reported that “about one per cent.” of coats prepared by us have been found injured by moth. But no proof is vouchsafed of the truth of this statement, and which we utterly deny. In our various communications we have shown that there was no proof that *any* coats had been moth-eaten *after* we had prepared them. It does not even appear that the store-keeper alleges that this “one per cent.” of coats was injured by moths *after* having been prepared by us, and that they were not so injured before they were subjected to our process, as was the case with the coats in our factory last sent us from the arsenal. (See affidavits, p. 23.)

In the examination at the arsenal, the only proof of injury to our prepared goods, after we had prepared them, summed up *one* pair of trousers directly and two pairs by

inference, in all *three garments*, out of about twenty-five thousand, or *about one-eighth-thousandth of one per cent.* The only evidence of moth was *four* declared to have been seen by the chief inspector, three by one of the workmen, and one of the three by another workman, and a loose statement that the workmen had "heard" of *thirteen* moths in all having been seen at one time or another; and these workmen, it should be borne in mind, have brushed and baled up not less than twenty-five thousand of the fifty thousand garments prepared by us. Yet, with this absolute proof of the misstatement of the store-keeper, and without adducing a scintilla of proof to sustain it, General Eaton not only assumes it to be correct, but intimates it may, in time, be found to be even larger, by suggesting further tests.

General Easton states in his report, when speaking of the trousers alleged to be injured by moth, "that these trousers were prepared by Messrs. Cowles & Co. there can be no doubt, as they bear the company's stamp. All articles treated by this firm are stamped by them with indelible ink." While we have not denied that the trousers in question may have been made from cloth prepared by us, and have suggested the probable cause of the injury, yet we are compelled to notice the inaccuracy of General Easton's statement, even in this regard. We do not stamp trousers made from cloth prepared by us, the stamp is put on after the trousers are made up, by the arsenal authorities, and we are no more responsible for it than we are for any other act of persons over whom we have no authority or control.

As for General Easton's statement regarding the Connecticut blankets, we simply refer to the evidence of the person in charge of them, which will be found in our sworn communication of the 5th instant, as follows:

"With regard to the Connecticut blankets, the fact was clearly elicited, after much difficulty, from the person in charge of them, that they had been left exposed and uncovered in the cellar of the building where they were stored, with the doors and windows constantly open, with the men attached to the arsenal continually going in and out of the cellar, or, as the witness expressed it, making it a 'thoroughfare,' till *about six weeks ago*, when, *for the first time since these blankets were in the store*, they were covered up and the cellar-doors kept closed. The 'about six weeks ago,' mentioned by the person in charge, coincides with the time when this question of moths upon our goods first arose."

We beg, with great respect, to ask the Quartermaster-General's attention to the documents which we subjoin, and which we supposed, until we received General Easton's report, that officer would consider as part of the record, in compliance with our not unreasonable request. And among these documents will be found our communication of the 30th of October, in which we practically guarantee the success of our process, by requiring payment only for moth-proof work.

We also beg the Quartermaster-General will take into consideration the long-continued tests, of the severest character, which our process has undergone for the past three years at the hands of the Department, and which the official records show it passed unscathed. And we also beg that he will note the fact that, in all the Army posts, no goods shown to have been treated by our process have been moth-eaten. And we then ask whether, with this abundance of proof in our favor, and with the result of the investigation at the Schuylkill arsenal, we have not a right to complain of the injustice of General Easton's report, and to repeat our request for the creation of a board to properly, thoroughly, and intelligently investigate the matter? As for the suggestion of still further tests, it can scarcely be seriously made, in view of the prolonged tests already had. If after three years of the severest tests the Department could institute, no case can be made out against our process, it is not probable a further delay would develop any new facts. We ask only for a clear and intelligent examination of the facts by a board of officers of high rank, who will be empowered to examine all the witnesses under oath—our workmen as well as those of the arsenal—and that we may be permitted to be present so as to elicit all the facts, feeling convinced that that alone is necessary for our complete vindication.

We have the honor to be, your obedient servant,

GEORGE A. COWLES & CO.

Major-General M. C. MEIGS,

Quartermaster-General U. S. A., Washington, D. C.

General Meigs, after a full consideration of the case, set aside General Easton's report, and recommended that our request for the creation of a board should be complied with, in the following report to the honorable the Secretary of War:

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., December 7, 1872.

SIR: I have the honor to inclose the report of Colonel L. C. Easton, Assistant Quartermaster-General, upon the process of Cowles & Co.; also a printed pamphlet, submitted by the patentees, in which they review the testimony.

General Easton has not yet reached a definite conviction on the subject.

Their review of the evidence in the case leaves me in doubt, though I incline to the belief that they have shown that the damage alleged to have been done to cloth prepared by them was probably in most, if not in all cases, done before the cloth was subjected to their process; and that the moths seen upon the garments in question were not bred there, or were feeding upon loose woolen dust or "fluff," which had settled upon them in the process of brushing moth-eaten clothing. This dust is known to be very attractive to moths.

I think it only just that the United States take measures to determine this question as quickly as possible, as the contractors are subject to expense during any delay; and I therefore recommend that a board of officers be directed to examine the garments at the arsenal thoroughly, allowing the contractors to be present at any examination of witnesses; and that their report be used in finally determining this question.

It is one of great importance, both to the War Department and to the contractors, and it is not now in a condition to be determined with certainty.

My mind at present inclines to the belief that the process, so far as it relates to the protection of woollens from ravages of moth, is successful. But considering the adverse opinion of the officers who have had charge of the property, I cannot recommend proceeding with the work without a definite and clear decision.

All papers on file relating to the subject should be laid before any board ordered.

I recommend that a board of three officers be designated by the Secretary of War, with instructions to investigate this matter, and report whether it is advisable to go on with this process or not.

M. C. MEIGS,
Quartermaster-General U. S. A.

The Honorable SECRETARY OF WAR,
Washington, D. C.

The Secretary of War approved General Meigs's recommendation for the creation of a board, and issued Special Orders No. 329 to that effect. This order will be found in the proceedings of the board, page 5.

Papers referred to by the board in their report.

Among the papers submitted to the board were the following reports and communications from the Quartermaster-General. The first is a communication to the Secretary of War, upon the general subject of processes for the preservation of woolen and cotton goods, and is important as showing the thorough knowledge possessed by General Meigs upon the scientific questions involved:

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., April 24, 1871.

Respectfully submitted to the Secretary of War, in obedience to instructions of the 18th instant:

I beg to call the attention of the Secretary of War to the fact that there are several patented water-proofing and preservative processes, which at first introduction are pressed by those interested, supported by experiments apparently showing their great value, but which in a few years disappear, and are not again heard of in use.

The kyanizing process, thirty years ago, was extensively introduced and used. It did, in a great measure, prevent mildew in canvass, and it was alleged that careful experiments in English dock-yards proved that it preserved timber from dry-rot. I believe it is now used nowhere, though it was adopted by the Engineer Department, and used for its timber constructions, and also by railroads in preserving sleepers. There have been many since—burnettizing, chloride of zinc, sulphate of iron, petroleum, carbolic acid, &c.

No process should be extensively applied to such costly articles as tents and clothing, until it has been tried in actual use. Any odor, any discoloration of the clothing, will lead to the rejection of the clothing and tents by the officers and troops for whom they are provided.

Complaints frequently reach this office that even the use of petroleum paper as a lining for boxes or bales in which clothing is packed, by discoloration, makes the clothing very objectionable to the troops.

I adduce these things only to show that great caution should be observed in dealing with these inventions. Nothing should be used without a full knowledge of the material and process used.

Some of the most effectual preservatives are poisonous. That which will poison in-

sects, vermin, and spores of the cryptogamic plants, which produce mildew, is sometimes powerful enough to be injurious to man.

The kyanizing process, one of the most successful, depended upon corrosive sublimate as its effective preservative agent.

Respectfully,

M. C. MEIGS,
Brevet Major-General, U. S. A., Quartermaster-General.

The process of George A. Cowles & Co. having been brought to the attention of General Meigs by the reports from the officers of the Schuylkill arsenal, (General Van Antwerp's and Mr. Neil Campbell's reports,) the Quartermaster-General, on the 5th of June, 1871, addressed the Secretary of War the following report :

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., June 5, 1871.

SIR: I have examined certain articles of cotton tents and woolen clothing which have been subjected to the patent process of Messrs. Cowles & Co., of New York, and which have been the subject of reports sent to the War Department on February 28, March 4, and April 24, 1871.

I think that the results of this experiment, viewed in connection with the testimony of many persons who have used canvas and cloth prepared in this mode, justify a trial on a more extended scale in actual use.

The owners of the patent have filed a description of their process, and a statement of the chemical re-agents used. They are not corrosive, nor are they, I believe, likely to be injurious to the material, or to those who use the articles thus prepared.

A copy of the letter of Messrs. Cowles & Co. is with this report.

It is suggested that this firm be requested to state the terms on which they will prepare 10,000 garments of all kinds, 1,000 tents, 50,000 yards sky-blue kersey; and that, if these terms are reasonable and satisfactory, these tents and garments, or the material for making them, be subjected to the process, and the articles made from this prepared material, properly marked, be issued, in filling requisitions, with equal quantities of the ordinary articles unprepared, and subjected to the test of actual use, side by side with those not water-proofed and mildew-proofed.

Very respectfully, your obedient servant,

M. C. MEIGS,
Quartermaster-General, Bvt. Major-General, U. S. A.

Hon. W. W. BEELKNAP,
Secretary of War, Washington, D. C.

On the 21st December following, General Meigs being absent from Washington, General Allen, Acting Quartermaster-General, addressed the subjoined letter to the Secretary of War, as to the result of the process since the date of General Meigs's report of the 5th June:

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., December 21, 1871.

SIR: In obedience to instructions of this day, I have the honor to report that, under authority of the Secretary of War, certain articles of clothing and tents, and a quantity of clothing materials, have been submitted to the patented process of Messrs. Cowles & Co.

All the prepared articles have been, or are being, distributed to the Army for test in actual service.

Thus far no reports have been received, but it is believed that the result will prove satisfactory.

From trials at the Schuylkill arsenal, this Department is favorably impressed with the test to which some of the prepared articles of clothing, &c., have been submitted.

In view of the great loss already sustained by the Government from damage to clothing by moths, and the fact that the manufacture of clothing has been resumed and will increase yearly, as the old stock left on hand at the end of the war becomes exhausted, it is important that the Department be provided with the means to prevent such damage in future, if possible.

Moths are already in much of the old stock of clothing now at the military posts,

and unless prevented they will be found in the new clothing soon after its arrival at such posts.

Very respectfully, your obedient servant,

ROBERT ALLEN,
Acting Quartermaster-General.

To the Hon. the SECRETARY OF WAR,
Washington, D. C.

On the 25th March, 1872, General Meigs addressed the following letter to the Hon. Cornelius Cole, giving the results generally gathered by the Department up to date, as to satisfactory results of the process :

WAR DEPARTMENT, QUARTERMASTER-GENERAL'S OFFICE,
Washington, D. C., March 25, 1872.

SIR: At the request of the Hon. J. R. West, of the committee, I have the honor to furnish such information as is in this office in regard to the application of the process of Cowles & Co. to Army clothing and equipment. During the past two years, experiments have been made by this Department to test the merits of this process, and the results so far are satisfactory.

There are now in store at the principal depots of this Department more than four million dollars' worth of clothing liable to be destroyed by moths; and if it can be rendered moth-proof a large saving will result to the Government.

Coats prepared by this process and exposed to the action of moths for sixteen months were untouched by them. One with live moths rolled up in it, after five weeks, was found uninjured, save in one small spot on the nap.*

Cotton tents wet and placed in a cellar on the damp floor, and allowed to remain thirteen months, were not mildewed, and proved on examination to be almost as strong as before.

Linen tents, of which there are several thousands on hand, have lately been considered unfit for issue to the Army, not being water-proof.

A few have been submitted to this process, and exposed to heavy rains, and have proved to be water-repellent. The inspector reports in relation to them—

"I think, from what I have seen of these tents, that they are good, serviceable, and a water-repellent. If all the linen tents were so prepared, I think they might be issued."

* * * * *

Very respectfully, your obedient servant,

M. C. MEIGS,
Quartermaster-General, Brevet Major-General, U. S. A.

HON. CORNELIUS COLE,
Chairman Committee on Appropriations, U. S. Senate, Washington, D. C.

Reports made by General Van Antwerp and Mr. Neil Campbell, referred to by the board.

SCHUYLKILL ARSENAL, Philadelphia, Pa., April 20, 1871.

COLONEL: In obedience to the following order of the 18th instant, from the Secretary of War, received by telegraph through the Quartermaster-General's Office, to wit:

"Captain V. P. Van Antwerp, military store-keeper: The Secretary of War directs that you report at once such facts as may have come to your knowledge as to the tests made in connection with G. A. Cowles & Co.'s process, and your own opinion thereon.

By order of the Quartermaster-General.

"J. D. BINGHAM, Major and Quartermaster"—

I have the honor to report—

1st. A note addressed by me upon the subject to Mr. Neil Campbell, inspector at this depot, together with his answer thereto, marked "A," and herewith inclosed.

My opinion, as regards the process of Messrs. George A. Cowles & Co. to protect clothing against the ravages of moth, accords with that expressed by Mr. Campbell, in the last clause of this report of his to me: that "had the cloth and clothing belonging

* The report shows that for eighteen months this coat had been subjected to the process, and that no moth-spot had been discovered in all that time. A couple of weeks thereafter the spot referred to by General Meigs was noticed. From the cumulative proofs in the report herewith presented, it is evident the spot was in the coat before being subjected to the process, but was overlooked at the time.—G. A. C. & Co.

to the Government, for the last ten years, been treated by this process, (that of Cowles and Co.,) the results would have been the saving of a large amount of money to the Government."

The tests made here of that process, with the results thereof, prove conclusively, to my mind, that it is of much value for the purpose mentioned. No application hitherto used for such a purpose—neither camphor, nor tobacco, nor "petroleum paper," nor any other preparation that has come to my knowledge—has proven a thorough preventive of the damage to clothing by moth.

Such was my experience during the three years, from May, 1867, till May, 1870, that I was in charge of the United States military depot for Army clothing in Texas, (at San Antonio,) and so it has been here.

Repeatedly, while at San Antonio, I was obliged to sell at public auction, and necessarily at a sacrifice, considerable quantities of clothing that had come to me with paper saturated with petroleum or carbolic acid placed all through it; but which, nevertheless, on being opened, was found to be damaged by moth. So here, too, a sale ordered, and which took place last fall, embraced a large amount of clothing, much of which was moth-eaten, and sold on that account.

Again, another large sale, ordered here for next month, includes no inconsiderable quantity of moth-eaten clothing. Yet this clothing, as well as that sold here at public auction last fall, had been put up in "petroleum paper."

Not unfrequently it happened in San Antonio that, on opening boxes filled with clothing thus prepared, it was found to be badly stained, and thus damaged the effect, as was believed, of the process to which it was subjected, so as to render necessary its sale at public auction. Hence, my opinion is, that the process of Messrs. Cowles & Co., as a remedy against the great injury done to clothing by moth, and as tested here, with the results of such tests, is a superior one to that of the "petroleum paper," which has so often proved inadequate where I have seen it tried. In regard to the water-repelling process of Messrs. Cowles & Co., for application to tents and flies, my attention was not called to the matter till the last examination of the results of the experiments, which was had in December, 1870, when the articles had undergone the severest possible tests for many months, some of them over a year. Referring to Mr. Campbell's report to me, herewith submitted, he says, in regard to the severest tests made upon a tent and fly, and the final result of which I saw in December, 1870:

"In August, 1869, a tent and fly, prepared by Messrs. Cowles & Co., were thoroughly wet, rolled up, and placed in the cellar of one of the store-houses, in immediate contact with the floor. In February, 1870, six months after, they were examined, no indication of mildew appearing on the fly. On the tent, spots appeared, which I at first believed to be mildew, but a recent and more thorough examination has convinced me was not. The tent and fly were again wet February, 1870, and placed, as before, in the cellar.

"On the 23d of September following, and thirteen months after the first wetting, they were again examined, no indication of mildew appearing on the fly. On the tent were several small places of mold, but by being rubbed between the hands it was nearly all removed from the surface, the thread appearing to be almost as strong as before the wetting of the tent. After this they were wet for the third time, rolled up as before, and placed in the same position in the cellar, (that is, 'in immediate contact with the floor.') On the 2d of December, ten weeks after, they were again examined, the fly showing no indication whatever of mildew, the tent showing an increase of spots, nearly all of which could be removed by rubbing as before."

This last examination of the tent and fly, when they had been subjected to the very severe test just described, thoroughly wet, rolled up, and placed in the cellar of a store-house, in immediate contact with the floor, where they remained some sixteen months, I witnessed on the 2d of December, 1870, and the condition of the articles, as has been described, is correct. There was no indication whatever of mildew on the fly. There were spots on the tent, of a green or brownish color, that could be removed by rubbing, and which, as I think, were neither mildew nor mold, nor did they seem to me to impair at all the strength of the fabric.

Having previously to this last unusual and extraordinary test, (a tent wet through with water, and placed for ten weeks upon the floor of a cellar,) been "thoroughly wet," and in the same cellar for over a year—making sixteen months in all that it was there—to have found it, after such treatment, not mildewed, would have seemed incredible. That the fabric was not utterly rotten and destroyed, as must have been the case with tent-cloth unprepared in some way to protect it against damage, on being similarly treated, was to me surprising. The first two examinations above described of the tent and fly, one at the end of six and the other thirteen months, (when the "spots" upon the tent—there being none whatever upon the fly—could be "removed by being rubbed between the hands,") furnish sufficient evidence, I think, that there was no mildew upon them.

As regards the first examination, (after as severe tests as that described—that is to say, by thoroughly wetting the articles, rolling them up, placing them upon the floor

of a cellar, and letting them remain there, undisturbed, in that condition for the period of six months,) Mr. Campbell states that he is convinced, after a "thorough examination, that there was no mildew upon them."

Now, again, as regards this matter, my experience is that tent and flies, rolled up wet, or damp, even, and put away so, in a perfectly dry and well-aired store-house above ground—not upon the floor of a cellar—unless prepared in some way to protect them against it, will become mildewed, if they do not, in fact, rot, and become so offensive as to make it necessary to remove them, within less than six months after being thus treated.

Having sometimes had them "turned in" to me in such condition, when unconscious of it, (I speak advisedly upon the subject,) my opinion is, therefore, that the process of Messrs. Cowles & Co., as a water-repellent and mildew-preventive, to preserve tents and flies from damage, as tested by experiments at this depot, is one that may be made of great value. Referring again to the report made to me by Mr. Campbell, the inspector, and herewith inclosed, I fully concur with him in regard to this matter, as well as to the process to prevent the ravages of moth in clothing, that, "had the cloth and clothing and tents belonging to the Government for the last ten years been treated by this process, (that of Cowles & Co.,) the result would have been the saving of a large amount of money to the Government."

I am, very respectfully, your obedient servant,

V. P. VAN ANTWERP,

Military Store-keeper, United States Army.

Lieutenant Colonel STEWART VAN VLIET,

Deputy Quartermaster-General U. S. Army, Philadelphia, Pennsylvania.

UNITED STATES ARSENAL, April 19, 1871.

CAPTAIN: In obedience to your instructions of the 17th instant, I have the honor to report that the following are the nature and result of the tests applied to certain articles of clothing and equipage treated by Messrs. Cowles & Co., by their moth and mildew preventive and water-repellent process:

On the 11th day of August, 1869, four great-coats (treated by C. & Co.'s process) were spread out in one of the rooms, in order that they might be exposed to the action of moths. In December, 1870, nearly sixteen months after, I examined these coats, and found no indication that they had been touched.

As a further and more severe test, I, on the 1st of March, 1871, caught some twelve or fifteen moths and placed them alive in one of the great-coats treated by C. & Co.'s process, rolled the coat up with the moths inside, and put it aside for five weeks. When opened and examined, I found the moths alive and the coat untouched, save in one small place on the nap, requiring close scrutiny to find it.

In August, 1869, two tents, prepared by Messrs. Cowles & Co., as well as others taken from our stock on hand, were submitted to the following tests:

In August, 1869, one of the prepared and one of the unprepared tents were set on the grounds at this depot, where they remained exposed to the action of all weathers for fourteen months. An examination of both tents at that time showed small green spots on the prepared tent, which a further examination has satisfied me was not mildew. The unprepared tent was spotted all over with mildew; but the strength of the material in both tents was about the same.

At the same time (August, 1869) a tent and fly, prepared by Messrs. Cowles & Co., was thoroughly wet, rolled up, and placed in the cellar of one of the store-houses, in immediate contact with the floor. In February, 1870, six months after, they were examined, no indication of mildew appearing on the fly; on the tent, spots appeared which I at first believed to be mildew, but a recent and more thorough examination has convinced me was not. The tent and fly were again wet, February, 1870, and placed, as before, in the cellar. On the 23d of September following, and thirteen months after the first wetting, they were again examined, no indications of mildew appearing on the fly. On the tent were several small places of mold, but by being rubbed between the hands it was nearly all removed from the surface, the thread appearing to be almost as strong as before the wetting of the tent.

After this examination they were wet for the third time, rolled up as before, and placed in the same position in the cellar.

On the 2d of December, ten weeks after, they were again examined, the fly showing no indication whatever of mildew, the tent showing an increase of spots, nearly all of which could be removed by rubbing, as before.

On the 23d of September, 1870, I wet two tents, one prepared by Cowles & Co., and one unprepared, and placed them in the upper story of one of the store-houses, near the roof. When examined, ten weeks after, the prepared tent was covered with light-colored moldy spots, nearly all of which could be removed by rubbing; the unprepared tent was covered with a black mildew, which could not be removed by rubbing.

Such have been the tests applied to the articles treated by Messrs. Cowles & Co.—a far more rigorous one than actual service could apply. From the nature of these tests I feel perfectly satisfied that had the cloth, clothing, and tents belonging to the Government for the last ten years been treated by this process, (Cowles & Co.'s,) the result would have been the saving of a large amount of money to the Government.

I am, very respectfully, your most obedient servant,

NEIL CAMPBELL,
Chief Inspector.

Captain V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

SCHUYLKILL ARSENAL, *Philadelphia, January 30, 1872.*

COLONEL: Referring to your letter of yesterday upon the subject, I now have the honor to submit herewith a communication addressed by me to Mr. Neil Campbell, inspector at this depot, together with his report.

I have made further and personal inquiry as to the test made with the great-coats, and do not hesitate to indorse the report made by Mr. Campbell upon the subject, as to their being a protection against rain. While the ordinary overcoat, unprepared by the water-proofing process, will become wet through, those thus prepared by Cowles & Co. keep the men, as stated by Mr. Campbell, perfectly dry.

The other points also, reported by the inspector, have my full concurrence.

Very respectfully, your obedient servant,

V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

Lieutenant-Colonel STEWART VAN VLIET,
Deputy Quartermaster-General, United States Army,
Philadelphia, Pa.

SCHUYLKILL ARSENAL, *Philadelphia, January 29, 1872.*

SIR: Several months ago some great-coats, which had been subjected to the water proofing process of Cowles & Co., were issued to the watchmen on duty here at the arsenal, to test the value of such process.

You will now report without delay the result of the experiment: whether or not such coats, thus treated, were a protection to the men when exposed to rain-storms, or to what extent.

Also, whether or not the kersey sent to Cowles & Co. for treatment was sponged before being sent to them; whether the cloth now being cut up for pantaloons is sponged; and if the kersey and cloth are not sponged, would, or not, this account for the shrinkage of the garments when subjected to the process of Cowles & Co.?

Very respectfully, your obedient servant,

V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

Mr. NEIL CAMPBELL,
Inspector, &c.

UNITED STATES ARSENAL, *January 30, 1872.*

SIR: I have the honor to report, in obedience with your instructions of this date, that the kersey and clothing treated by the process of Messrs. Cowles & Co. were not sponged before being treated. All cloths should be sponged before being made up into clothing; if not sponged, the first wetting causes the cloth to spot and shrink, and lose its gloss. The color of the cloth is not affected by the process of C. & Co., and the slight shrinkage that takes place adds to the strength of the material. I have tested the kersey both before and after being treated, and find the strength is increased after treatment.

Some seven of the great-coats treated by C. & Co. have been used by the watchmen at this depot during the heaviest rain-storms for the last three months. The test was a practical one, and as severe as can with reasonable wear ever be applied. The testimony of the watchmen, so far as water-repelling power is concerned, is very favorable. While the coat in a measure absorbs the moisture, the rain does not penetrate, and the men are kept perfectly dry. I have also tried the kersey after being treated, and find that water does not adhere to the fiber, as in kersey unprepared.

This process has the same effect as sponging, and answers that purpose. It has not

been the custom to sponge cloths before being made up into Army clothing, and the process of C. & Co. answers a good purpose in that way, as all cloths should be sponged before being made up.

I am, very respectfully, your most obedient servant,

NEIL CAMPBELL,
Chief Inspector.

Captain V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

SCHUYLKILL ARSENAL, Philadelphia, July 2, 1872.

COLONEL: In reply to your communication of June 22d last, referring copy of letter of the Quartermaster-General, dated June 17, relative to the treatment of clothing by George A. Cowles & Co., I have the honor to report—

That on the 20th of April, 1871, a full report was made upon this process, both as regards its effect upon woolen goods and canvas. In that report was given the result of a test of sixteen months upon a tent and fly, both of which had been kept in a damp cellar and wet several times, of which I said, in speaking of the test: "Having previously to this last-mentioned and extraordinary test (a tent wet through with water, and placed for ten weeks upon the floor of a cellar) been 'thoroughly wet,' and in the same cellar for over a year, making SIXTEEN MONTHS IN ALL that it was there, to have found it, after such treatment, *not* mildewed would have seemed incredible! That the fabric was not utterly rotten and destroyed, as must have been the case with tent-cloth, unprepared in some way to protect it against damage on being similarly treated, was to me surprising."

Since making the report above mentioned no further tests have been made with cotton goods.

With woolen material, however, further experiments have been made, the result of which increases my faith in this process as a moth-preventive. Some three months ago a lot of blankets was received at this depot from the State of Connecticut. These blankets were literally alive with moths, and were packed away with all possible haste, in order that the stock on hand should not become infected. In one of these boxes, on the 30th of April, were packed three prepared great-coats and three prepared pairs of trousers, and when opened this morning they were as bright and fresh as when packed away, and no trace of moth to be seen, although the blankets are very badly eaten. This experiment, lasting through the months of May and June, the latter month a very warm one, seems to be an almost convincing proof in favor of this process as a "moth-preventive."

My attention being invited particularly to the subject of the effect of the process upon the strength of the material, the unpleasant smell arising from the ingredients used, and the great change in the appearance of the goods,* after washing, I have simply to refer to my report of the 1st instant, and that of the chief inspector, forwarded at the same time. The allegation that the strength of the material was unfavorably affected, that there was an unpleasant odor attending goods so treated, was thoroughly refuted by the testimony of the night-guard at this depot—testimony taken after an experiment (and a very practical one) embracing nine months.

The great-coats worn by these watchmen are still in my office, and can be forwarded to you for transmission to the Quartermaster-General, if so desired. The chief inspector has been testing the merits of this process by my directions, and the result of his experiments appears in his report to me, which I send herewith. All the clothing treated by this process has been baled in burlaps, with no other protection than the wrapping-paper. This clothing I had so baled for the reason that, if it is proof against the ravages of the moth, it is useless to expend more money for petroleum paper.

In no single instance have I discovered that any of this clothing, some of it packed nearly a year, has been moth-eaten.

I view of the above facts, I cannot but believe that this process will be of great use to the Government as a moth-preventive, and to the soldier in the field as a "water-repellent," which latter is, to my mind, fully established by the testimony of the night-guard.

Very respectfully, your obedient servant,

V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

Lieutenant-Colonel L. C. EASTON,
Deputy Quartermaster-General, United States Army, Philadelphia.

* This is with reference to a statement made by an officer at Buffalo, New York, as to the effect of the process on the clothing; but which clothing, when sent to the arsenal, was found NOT to have been treated by Cowles & Co.

SCHUYLKILL ARSENAL, *Philadelphia, July 2, 1872.*

CAPTAIN: In obedience to your instruction, I have the honor to report that, since my appointment as chief inspector, in February last, I have been experimenting upon clothing and materials treated by the process of Messrs. Cowles & Co., both as regard its effects as a moth-preventive and water-repellent.

My experiments with regard to moth consisted in packing clothing during the month of April in a lot of blankets which was received from the State of Connecticut, and which you know to be filled with moths, and where, if there was any possibility of clothing being eaten by moths, this was the place. When the box was opened by me to-day no trace or sign of moths was to be seen except in the blankets they were wrapped in. My opinion is, that the ingredients used—what they are I know not—are such that no moth will eat.

I have also examined very carefully a number of bales of clothing treated by Cowles & Co. about a year ago; so I am informed. This clothing was baled without petroleum-paper, simply in burlap, lined with ordinary wrapping-paper. This was done, I suppose, by your instruction, and to test the merits of the process. This clothing has now been subjected to the heat of a warm summer, a number of bales left open in the store-house, also, I believe, by your orders; and I have failed to discover any garment, although I have examined many, in the least moth-eaten. I know of no better experiment than this, and confess that I would hesitate to expose clothing not treated by some process in such a manner.

In relation to the water-repellent properties of this process, the verdict of the night-watchmen at this place is a very strong one. The coats worn by them are now in my office by your orders, and have been *well worn*.

They do not appear to me to be in any way weakened in strength or changed in color; and it is my opinion the color is improved by this process, particularly in the goods done in the piece, as the making-up afterward and pressing bring out the proper finish, which cannot be done so well when made up. Looking at the whole process, as far as I have gone, as a moth-preventive, and, as I have before said, its improvement of the cloth, particularly when done in the piece, and if it should, as I think it will, stand another summer, in my opinion it is and would be a very valuable agent for the Government.

Very respectfully, your obedient servant,

FRANK S. JOHNSTON,
Chief Inspector United States Arsenal.

Captain V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

SCHUYLKILL ARSENAL, *Philadelphia, June 23, 1872.*

COLONEL: Referring to the communication of the Quartermaster-General, dated June 25, 1872, with your indorsement thereon directing me to report upon the great-coats treated by George A. Cowles & Co., and worn by the night-watchmen at this depot, I have the honor to state, that in the latter part of October, 1871, six great-coats treated by Messrs. Cowles & Co. were given to the night-watch at this depot, with directions to test them thoroughly, for the purpose of ascertaining whether or not the process by which they were treated made the coats "water-repellent."

The names of the watchmen by whom these coats were worn are: John Fryburg, captain of watch; Samuel Price, Robert McFeeters, Lewis H. Sweeney, Martin C. Courtney, Isaiah Smith, Conrad Miller, Thomas Patterson, John Cross, C. Edward Miller, and Samuel Clarke.

For the purpose of answering the inquiries of the Quartermaster-General, I examined privately each of the above-named watchmen, and reduced their testimony to writing, which testimony I have the honor to send herewith.

The information desired by the Quartermaster-General appears so fully in the statements of these watchmen, and is given after an experience of some nine months, during which time, as will be seen, the coats were almost constantly worn, that I respectfully forward the same for your consideration, without further remarks.

Very respectfully, your obedient servant,

V. P. VAN ANTWERP,
Military Store-keeper, United States Army.

Lieutenant-Colonel L. C. EASTON,
*Deputy Quartermaster-General,
United States Army, Philadelphia.*

Statement of JOHN FRYBURG, captain of the night-watch.—About nine months ago I was given six (6) great-coats, which General Van Antwerp directed me to distribute among the night-watch under my charge, to see if they were water-proof. They were

part of a lot treated by a company in New York: I don't remember the name now. All the watchmen, from time to time, wore them. I also wore one of them. They were taken out every night, and worn in every rain, from the time they were given in my charge up till the present day. They were worn all through the winter, through rain, snow, and sleet. I have put on a coat in heavy rains on purpose to test it. Have worn one of these coats in heavy rains, with nothing underneath but a white cotton shirt. Never noticed any disagreeable smell on these coats any more than any other Army clothes. They smell like petroleum-paper, in which the goods are packed. I never noticed any change in the color of the kersey. The coats are the same color now as when we got them. They appear to be as strong as ever they were; but they have been roughly handled, and may be weaker from wear and tear than a new coat. I do not think the stuff with which they are treated injures them in strength. As to their being water-repellent, I have, as I said before, worn them in heavy rains, and with nothing on under them except a cotton shirt, and I have never been wet. The coat gets wet, but the water runs down and drips off; but it don't go through the coat. One of the watchmen, who has left, named Samuel Leger, put on one of these coats and sat on a box and walked up and down for three hours in the heaviest storm we had last winter. I asked him why he got so much in the way of the rain, when he said he was bound to see if the coat was water-proof. When he took the coat off, at half-past twelve o'clock, when he was relieved from duty, he was perfectly dry underneath. I do not know whether they are moth-proof or not. The coats are always loose in the guard-house when not worn, and no pains were taken to protect them from moths.

JOHN FRYBURG.

Statement of SAMUEL PRICE.—I am one of the night-watch at the arsenal. About eight or nine months ago a lot of coats were given to the watchmen to try. They had been prepared by some party to make them water-proof. I have worn one of these coats ever since. We got them while I was on duty. I have been out with it in heavy rains—in fact, in every storm since I have had it. The coat kept me dry underneath; for, although the coat would get wet, the water would drop off. It don't soak the water and get soggy, like the Army coats. I have been in the Army myself, and think the way this coat is treated would be a good thing for soldiers in the field, and an improvement on the plain Army coat. I never noticed that there was any disagreeable smell about these coats. I don't notice that the coats are changed in color; they have been kicked about, and look a little dirty. They smell a little; but no more than any other goods. They smell of petroleum-paper, but I find no other smell about them. I don't know that they are any weaker in strength than any other coats; if they are I did not discover it. I don't know whether the moths will eat them or not. I didn't take any steps to keep them from doing so.

SAMUEL PRICE.

Statement of ROBERT McFEETERS.—I am one of the night-watchmen at the arsenal. About last October a lot of coats were sent to the guard-house to be tried. I was told that these coats had been put through some kind of a process to make them water-proof. Samuel Price and myself wore the same coat, because I relieve Price, and we wear the same coat. I have worn this coat in very heavy rains. It would get very heavy with water, but would let no water through. I have worn no other coat since this one was given to me; have had it in all kinds of storms, and my clothes never even get damp; in fact, I never saw the coat wet through. I can't say that I ever found any bad smell about the coat, any more than any other clothes packed up in boxes. If there was any bad smell, it soon left when the coat was exposed to the air; but I do not remember that there was any smell. I never noticed that it changed any in color after I had received it; nor do I think it was injured in any way in strength.

It is a good strong coat to-day. I do not know whether it is proof against moths or not; it has been hanging up in the guard-house when not in use, and no steps taken to keep moths from getting at it. I am of the opinion that these coats are an improvement on the old Army coat, because I have worn a great-coat in the Army. I would like to have it myself.

ROBERT McFEETERS.

Statement of LEWIS H. SWEENEY.—I am one of the night-watchmen. About nine months ago a lot of coats were given to the night-watch, to try whether or not they were water-proof. These coats had been put through some process, we were told, that would make them water-proof. We commenced to wear the coats from the time that

we got them; and I wore mine through all the rains during last fall and winter. One very heavy rain, the heaviest for a long time, when one of the sheds blew down, I was out in for three hours. The rain ran off the cape and off the bottom of the coat, but did not go through. I was perfectly dry underneath. I have been wearing the coat in stormy weather all the time since I have had it. I have never found any disagreeable smell about the coat, nor do I think that the color has changed in any way since I received it. I do not notice that the material is in any way weaker than when it was first made.

The coat to-day is, in my opinion, as strong as ever it was. I know nothing as to the moth-repelling qualities of the preparation. The coats have been used so much that moths could hardly have any chance to eat them.

LEWIS H. SWEENEY.

Statement of MARTIN C. COURTNEY.—I am one of the night-watchmen. I was not present at the examination of Mr. Sweeney. I am his partner on the watch, and we wear the same coat. Mr. Collins read to me carefully what Sweeney had said, and I agree with him in every particular.

MARTIN C. COURTNEY.

Statement of ISAIAH SMITH.—I am one of the night-watchmen. About nine months ago a lot of coats were given to the watchmen to be worn on duty. We were told that they had been prepared by some parties to make them water-proof. One of these coats was given to me, and I have worn it ever since, in all kinds of weather, while on duty. I have had it in the hardest kind of rain, and it kept me perfectly dry. I have worn all kinds of coats in my time, but have never seen anything equal to this one for keeping out the wet. I never noticed any disagreeable or unpleasant smell about the coat since I have worn it; nor have I noticed that it changed in color. I do not think that the coat is in any way injured by this treatment. The coat is now good and strong, although it has been pretty roughly used by Thos. Patterson and myself. I think it is a great improvement on the old Army coat, from my experience in the Army. I know nothing as to its being a moth-repellent. We tried it only as to water. The coat has, when not in use, been hanging up in the guard-room, and no means taken to keep moths away from it.

ISAIAH SMITH.

Statement of CONRAD MILLER.—I am one of the night-watchmen. Somewhere about eight months ago a lot of coats were given to the watchmen, to be worn in rain and storms. We were told that they had been fixed up by somebody so that they would keep out water. I have worn the coat I got all kinds of storms, through the winter and spring, and on up to now. I wore no other coat while I was on duty since I had it. The coat kept me perfectly dry in the rains and snows. Never noticed any bad smell about the coat since I have had it. I have not noticed that it changed any in color since I have had it. Do not think that the kersey is in any way injured by the treatment of this Water-proofing Company. The coat now appears to be new and strong. Don't know anything about moths eating coats prepared in this way. I think this coat is a great improvement, as far as keeping out water is concerned.

CONRAD MILLER.

Statement of THOMAS H. PATTERSON.—I am one of the watchmen at the arsenal. About eight months ago a lot of coats, that had been prepared by some company, so we were told, were given to the watchmen to wear, and see if they were water-proof. One of these coats was given to me and Smith, and we both wore it while on duty since that time, in all kinds of weather, and it always kept me dry. I was not present while Smith was being examined; but I have heard his statement read, and can indorse every word of it.

THOMAS H. PATTERSON.

Statement of JOHN CROSS.—I wore the same coat while on duty that Conrad Miller did. I was not present when he was examined; but have heard his statement read, and can indorse what he says. I will say for myself that if I had the choice of a coat for my own wear, I would take one of this kind.

JOHN CROSS.

Statement of C. EDWARD MILLER.—I am one of the night-watchmen at the arsenal. I have worn one of the great-coats treated by the company who have the water-repelling process. I have not worn it as constantly as the other workmen, from the fact that I am stationed at the front gate of the arsenal. I have, however, worn it very frequently, and in very heavy rains. On one occasion I wore it, with scarce a half-hour's intermission, all through the night, and during the prevalence of a very heavy rain, and was kept perfectly dry. I never found any disagreeable smell about, more than that from the box in which packed; nor have I noticed any change in color; nor do I think the process has a tendency to weaken the goods. I have seen moths around the little room in which we have our clothes; but have not been able to discover that the coat has been in any way damaged by them.

C. EDWARD MILLER.

Statement of SAMUEL CLARKE.—I am one of the night-watchmen at the arsenal, stationed at the front gate with Miller. I have worn one of the coats treated by the Water-proofing Company, the same one worn by Miller. Have, on several occasions, been exposed to very heavy rains, and have been kept perfectly dry underneath. Never noticed any bad smell about the coats, other than that of petroleum-paper, in which they had been packed. They keep wet for some time, but the water does not go through. Don't know that the process weakens the goods. Have plenty of moths in our little room where we keep our clothes; but I have not seen any moth-holes in the coat.

SAMUEL CLARKE.

Reports from the various Army posts.

The following reports are from officers in charge of clothing and equipage in the various Army posts, and were before the board, as a portion of the evidence upon which they formed their report. Some reports were of an unfavorable character; but, as is stated by the board, an investigation by the Quartermaster-General, in every instance, proved these unfavorable reports to have been based upon a mistake in the officers making them. In every instance, it was shown that the clothing reported upon unfavorably had not been subjected to the process of George A. Cowles & Co. In all the various Army posts, no clothing or canvas, which it was shown had been subjected to the process of Cowles & Co., has failed to give the fullest satisfaction in all respects.

WEST POINT, NEW YORK, *May 25, 1872.*

MAJOR: In reply to your letter of the 23d instant, I have the honor to inform you that the prepared clothing sent me from Philadelphia depot, February 6, 1872, is, so far as I have observed, moth-repellent. My opportunity for observing is this: The clothing has been stored ever since its receipt in the same room (a large store-room, occupying the entire upper-story of the engineer barrack, at this post) with some of the old clothing.

The latter is much injured by moths, while the new clothing is not at all so. No objections have been made to wear it by the enlisted men.

On the contrary, it is in great demand, as heavier and wearing better.

Very respectfully, your obedient servant,

O. H. ERNST,

Captain Corps of Engineers, Commanding Company "E," Battery Engineers.

Major J. D. BINGHAM,

Quartermaster United States Army, Washington, D. C.

OFFICE OF THE ACTING ASSISTANT QUARTERMASTER,
Fort Wood, New York Harbor, May 27, 1872.

SIR: In reply to your communication of the 23d instant, in regard to the prepared clothing received at this post from the depot at Philadelphia, January 16, 1872, I have the honor to report, that until now no sign of moth is to be seen on those in the quartermaster's store-room, notwithstanding they are stored near some very old clothing. The prepared trousers issued to the men give universal satisfaction, if only on account of their color; as they are uniformly of better color than those on hand before them.

I am, sir, very respectfully, your obedient servant,

JNO. POPE,

Second Lieutenant, First Artillery, Acting Assistant Quartermaster.

QUARTERMASTER-GENERAL, UNITED STATES ARMY,

Washington, D. C.

OFFICE ACTING ASSISTANT QUARTERMASTER,
Fort Foote, Indiana, May 27, 1872.

GENERAL: In reply to your communication of the 23d instant, pertaining to prepared clothing, I have the honor to reply that, after an examination of the clothing, I found that no damage had been done to them by moths; and the clothing is not objected to by the enlisted men, no complaints having ever yet been made regarding them.

I am, general, very respectfully, your obedient servant,

FREDERICK FUEGER,
Lieutenant, Fourth Artillery, A. A. Q. M.

General M. C. MEIGS,
Quartermaster-General United States Army, Washington, D. C.

OFFICE ACTING ASSISTANT QUARTERMASTER, May 28, 1872.

SIR: In reply to your letter of the 23d instant, I would respectfully state that the articles of clothing, &c., forwarded me from Philadelphia, Pennsylvania, January 17, were not received till February 6, 1872; and in my inspection this month no evidences of moth were found in them. As my store-house is entirely free from moths, I do not feel that this invoice of clothing has been tested as to its moth-repellent properties.

The quality of this clothing is superior to any that has been received at this post for the past three years, and is not objected to by the men.

Very respectfully, your obedient servant.

GEO. W. DESHLER,
Second Lieutenant, First Artillery, A. A. Q. M.

The QUARTERMASTER-GENERAL, UNITED STATES ARMY,
Washington, D. C.

OFFICE ACTING ASSISTANT QUARTERMASTER,
Fort Washington, Maryland, May 31, 1872.

GENERAL: In reply to communication of 23d instant from your office to Lieutenant Everett, Fourth Artillery, referred by that officer to me, relative to prepared clothing, I have the honor to report that, as far as is known, the clothing was moth-repellent, none of the articles having been at all injured by moth, from their receipt here in March till their issue during the month of April. The time of observation was much shorter than could have been desired, so far as concerns their safety in the store-house. The men received them preferably to any other trousers. The color and material appear to be better than anything I have seen in a number of years in the way of Government clothing.

I am, general, very respectfully, your obedient servant,

M. C. GRIER,
First Lieutenant, Fourth Artillery, A. A. Q. M.

Brigadier-General M. C. MEIGS,
Quartermaster-General, United States Army, Washington, D. C.

OFFICE ASSISTANT QUARTERMASTER,
Brownsville, Texas, June 8, 1872.

SIR: In reply to letter of the 23d ultimo, from your office, relative to moth-repellent trousers, I have the honor to report that no objections whatever have been made by enlisted men to wearing the clothing; on the contrary, they speak in favorable terms of the quality and wear of the same.

Very respectfully, your obedient servant,

E. J. STRONG,
Captain and A. A. Q. M., Brevet Lieutenant-Colonel, U. S. A.

Brigadier-General M. C. MEIGS,
Quartermaster-General, United States Army, Washington, D. C.

POST QUARTERMASTER'S OFFICE,

Savannah, Georgia, June 29, 1872.

GENERAL: I have the honor to inform you that, agreeably to my letter of May 28, I have had exposed since that time one blouse and pair of pants, subjected to the action of the "water-repellent and mildew-preventive," received with the clothing invoiced me from Philadelphia depot March 22, 1872.

On examining the articles, which have been exposed for the last thirty-one days, I find to-day that they are in the same condition as when received from Philadelphia, and entirely uninjured by moth.

I am, general, very respectfully, your obedient servant,

C. A. H. McCAULEY,

Second Lieutenant, Third Artillery, A. A. Q. M.

Brigadier-General M. C. MEIGS,

Quartermaster-General, United States Army, Washington, D. C.

DEPOT OF ARMY CLOTHING AND EQUIPAGE,

Jeffersonville, Indiana, July 2, 1872.

GENERAL: Herewith I have the honor to forward a sample each of duck (prepared and unprepared) which have been submitted to an equal test as to mildew-preventive qualities since my report of the 15th ultimo. These samples present more clearly the virtues of the preparation than those previously sent; hence my forwarding them.

They were kept saturated for seventeen (17) days, and the results show that the preparation has entirely resisted mildew for a period in which the unprepared duck has become completely rotten.

I am, general, very respectfully, your obedient servant,

JOHN T. RODGERS,

Captain and Military Store-keeper, United States Army.

Brigadier-General M. C. MEIGS,

Quartermaster-General, United States Army, Washington, D. C.

OFFICE OF THE POST QUARTERMASTER,

Louisville, Kentucky, July 20, 1872.

GENERAL: In compliance with directions relative to the merits of trousers rendered water-proof and proof against damage by moths, I have the honor to report, that after a fair trial they are found to be thoroughly moth-proof, but not quite water-proof. The quantity of the material is found to be superior than that heretofore issued.

Very respectfully, your obedient servant,

HENRY J. HOWLAN,

First Lieutenant and R. Q. M., Seventh Cavalry, A. A. Q. M., United States Army.

The QUARTERMASTER-GENERAL,

Washington, D. C.

LIGHT BATTERY F, FIFTH ARTILLERY,

Fort Adams, Rhode Island, September 4, 1872.

GENERAL: In reply to your communication of June 27, 1872, I respectfully report, that the new-pattern mounted trousers sent to this battery for trial have given the greatest satisfaction. The cloth is found to be firmer, and wears better, while the outlets in the seams enable the trousers to be altered to fit the wearer, without his being compelled to draw a size much too large, so that it can be cut down.

No objectionable odor or injury to the fabric has been observed to result from the process to which they have been submitted to render them moth-repellent.

Very respectfully, your obedient servant,

H. A. DUPONT,

Captain, Fifth Artillery, Commanding Light Battery F.

Brigadier-General M. C. MEIGS,

Quartermaster-General, United States Army, Washington, D. C.

HEADQUARTERS TROOP B, SEVENTH CAVALRY,
Post of Spartanburgh, Spartanburgh, S. C., September 30, 1872.

SIR: In compliance with instructions received from you through the acting assistant quartermaster of this post, dated April 24, 1872, requesting officers to whom water and moth proof trousers and mildew-proof tents have been issued to report, after a fair trial, the merits of the same, I have the honor to state, that in my opinion the water and moth proof trousers are superior to the old issue. The mildew-proof tents have been in use since the 1st of May, 1870; and I also consider them a great improvement on the old style, as being what they are recommended to be—water and mildew proof.

I am, sir, very respectfully, your obedient servant,

WM. THOMPSON,

Captain, Seventh Cavalry, Commanding Troop B.

The QUARTERMASTER-GENERAL, UNITED STATES ARMY,
War Department, Washington, D. C.

POST QUARTERMASTER'S OFFICE,
Fort Hays, Kansas, November 19, 1872.

SIR: In compliance with note expressed on invoice of Captain John Livers, military store-keeper, United States Army, dated Fort Leavenworth, Kansas, October 11, 1872, I have the honor to report to you that the one (1) bale of 200 pairs of trousers, mentioned on said invoice, subjected to the water-repellent, moth and mildew preventive of Messrs. Cowles & Co., were opened for issue about October 24, 1872, and found to be in excellent condition, and have continued so up to this date.

Very respectfully, sir, your obedient servant,

FRANCIS B. JONES,

First Lieutenant, Third Infantry, A. A. Q. M.

The QUARTERMASTER-GENERAL, UNITED STATES ARMY,
Washington, D. C.

○

EXAMINATION OF CANDIDATES FOR CLERKSHIPS IN THE
NAVY DEPARTMENT.

LETTER

FROM

THE SECRETARY OF THE NAVY,

RELATIVE TO

The questions propounded by the examiners to the candidates for appointments and promotions to clerkships in the Navy Department.

FEBRUARY 8, 1873.—Referred to the Committee on the Re-organization of the Civil Service of the Government and ordered to be printed.

NAVY DEPARTMENT,
Washington, January 31, 1873.

SIR: I have the honor to furnish herewith, in compliance with a resolution of the House of Representatives adopted on the 27th instant, a "copy of all the questions propounded by the examiners to the candidates for appointments and promotions to clerkships" in the Navy Department.

Very respectfully, &c.,

GEO. M. ROBESON,
Secretary of the Navy.

HON. JAMES G. BLAINE,
Speaker of the House of Representatives.

EXAMINATION No. 1.

Promotion.—Clerkship of Class Two.—Bureau of Provisions and Clothing, December 14, 1872.

PRELIMINARY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?

5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the character of the duties you perform.

ARITHMETICAL.

9. Write in figures the following numbers:

Thirty-two thousand and sixty.

Four millions two thousand and six.

Six hundred and one millions, twenty-five thousand, three hundred and one, and decimal eleven hundred thousandths.

10. Write at length the numbers expressed by following figures:

301,500.

231,607,005.

506.0025.

249,064.00001.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

37,640,787	95
109,741,134	10
209,464,215	25
309,226,813	42
266,027,537	43
191,087,589	41
158,356,460	86
311,533	83
194,572	32
24,709	46
118,248	30
92,718	50
150,476	14

37,640,787	95
109,741,134	10
209,464,215	25
309,226,813	42
266,027,537	43
191,087,589	41
158,356,460	86
311,533	83
194,572	32
24,709	46
118,248	30
92,718	50
150,476	14
103,880	82
149,004	15
175,111	81
193,636	59
269,803	41
315,022	36
205,217	87
379,558	23
384,720	19
445,485	18
464,546	52
427,124	98
337,032	62
315,783	47

Show the operation at length in each case.

12. The standard gold dollar of the United States contains nine parts of pure gold and one part of alloy, and weighs 25.8 grains troy. How many grains of gold and alloy, respectively, are required for the coinage of 6,983 gold dollars?

13. The Ordnance Department sold at public auction 12,750 condemned Springfield muskets, at \$12.37½ each, the original cost of which was \$14.75 per piece; 3,075 sabers, at \$3.87½ each, which cost \$5.31½ per piece; and 100,000 rounds of cartridges for \$5,000, the original cost being \$1.25 per 100 rounds. What was the total original cost, and what was the amount realized?

(Give the operation and result in common fractions.)

14. The duty on spool thread of cotton, containing 100 yards to the spool, is 6 cents per dozen spools, and in addition thereto 30 per cent. *ad valorem*, (or upon the value.) What is the amount chargeable on 11,153 spools, valued at 3 cents a spool?

15. A transport was hired to carry 315 tons of Government stores from New York to Charleston, at the rate of \$3.3125 per ton per month. The vessel left New York at 2 o'clock a. m., August 16, 1871, and reached Charleston on the 21st of the same month at 11 o'clock a. m. How much pay was due, allowing 30 days to the month?

(Give the operation and result in decimal fractions.)

16. What time is required for \$25,250.00 to gain \$5,162.22½, at the rate of 8 per cent. interest *per annum*, reckoning 360 days to the year?

17. A paymaster made the following payments to the regiments of a brigade, to wit: To the first regiment, \$10,000; to the second, \$9,500; and to the third, \$8,575.62. Of these amounts \$2,500, \$2,275, and \$1,850 were, respectively, suspended for informalities in the vouchers. What was the per cent. of suspensions on each payment and on the total amount paid?

18. Calvin Hale pays \$7,350 in currency for Indian goods worth \$6,345 at gold prices. What is the premium on gold; what is gold worth in currency; what is currency worth in gold?

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$11,870.63; February 1, he pays out \$3,220.34, on which he is entitled to a commission of $1\frac{1}{2}$ per cent. March 1, he receives \$3,750.87; May 1, he pays out \$4,763.82, on which he is entitled to a commission of $2\frac{1}{2}$ per cent.

Make a statement of his account in the frame beneath, showing balance due the United States.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

20. Where was the first permanent English settlement made in the United States?

21. Name the thirteen original colonies.

22. When was the second war between this country and Great Britain declared, and for what reason?

23. Is the President authorized ever to adjourn both Houses of Congress, and if so, under what circumstances?

24. How may the Constitution be amended?

25. In the following list, state which are sea-ports and which inland cities; Albany, Charleston, (S. C.,) Raleigh, Atlanta, Savannah, Portland, and Hartford.

26. What rivers unite and form the Ohio?

27. What are the principal tributaries of the Mississippi River?

ORTHOGRAPHY AND PUNCTUATION.

28. Copy the following passage clearly and legibly, correcting mistakes of orthography and punctuation, but not otherwise altering either the words or their order:

the infleunce of printing upon the english landgwide has bin much extended and strengthened by to important sircumstances comon to thee two grate countrys of whitch it is the virnackuler the one is that in neather does their. Exist nor for senturies has thare existed a sencership of the Press a previus orthoritative examina-shun of manuskript matter intendid for The Publick;—the other is that publick dis-kussion of all questions in the departments of religion of intelectual and morral filos- ofy of Pollyticks indede; of awl topics afecting the grate and purminant interests of man; is free and unrestricted hence the populer mind the populer speach in both countries are open to a class of infleunces whitch in moste Continentle Staits are confined to the priviledged and professsional alone.

SYNTAX.

29. Copy the following sentences, and correct the errors in syntax:

The rapidity of his movements were beyond example.

The wall is ten foot high.

I have neither Johns or Williams' book.

Which of those two cords is the stronger?

Who did you go with?

The sight appeared terrible to me.

I can learn him many things.

He done me no harm, for I had wrote my letter before he come home.

LETTER AND BRIEF.

Upon completing the letter the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the Board of Examiners, and fold and brief your reply:

1. What supplies for the Navy, if any, do not have to be procured by contract, after advertisement, with the lowest bidder?

2. Who cannot be received as sureties on a contract for naval supplies?

3. What is the difference between a commission and a warrant, as issued to officers of the Navy?

4. How are naval appropriations of a Bureau drawn from the Treasury?

5. What is the commutation price of the Navy ration?

6. What is the period of enlistment for seamen, and what for marines?

7. With what description of guns are our ships-of-war generally armed?

8. Is a paymaster, in the issue of stores, required to issue them at cost, or is he allowed to add a percentage to cover any loss?

9. If, on examination of a paymaster's returns, it is found that certain articles of clothing or small-stores are unaccounted for, what action is taken in the matter?

EXAMINATION NO. 1.—FOR ADMISSION, JANUARY 13, 1873.

BUREAU OF PROVISIONS AND CLOTHING.

Clerkship of class one.

NOTE.—The signature of the candidate to be annexed. Answers to be given opposite or under the questions. The operation in the examples must be shown in full in each case.

1. Name?
2. Residence?
3. Place and date of birth?
4. Brief statement as to your education?
5. What experience in business or profession?
6. What clerical or other experience in Government service?

ARITHMETICAL.

7. Write in figures the following numbers: Twenty-four millions and six, and decimal forty-two thousandths. Nine hundred and six millions, two hundred thousand and one, and decimal six hundred thousandths.

8. Write in words the numbers expressed by the following figures:

2,308.3051.

.97500.

9. Express in decimal form by figures: $7\frac{17}{100000}$.

10. Express by figures: Seventy-nine million two thousand, and six hundred five-thousandths. Ten thousand five hundred and five millionths.

11. Add the following column of figures:

\$37,640,787 95
109,741,134 10
209,464,215 25
309,226,813 42
266,027,537 43
* 191,087,589 41
158,356,460 86
311,533 83
194,572 32
24,709 46
118,248 30
92,718 50
150,476 14
103,880 82
149,004 15
175,111 81
193,636 59
269,803 41
315,022 36
205,217 87
379,558 23
384,720 19
445,485 18
464,546 52
427,124 98
337,032 62

12. Multiply the following figures:

\$896,745 54
726,047 86

13. Give in figures the difference between the above two results.

14. A clerk agreed for a house as follows: To pay the contractor 3 per cent. profit on the cost of the materials, and $4\frac{1}{2}$ per cent. profit on the cost of the labor, and was, himself, to be allowed $3\frac{1}{2}$ per cent. on the total cost of the materials and labor in consideration of prompt cash payment. The materials used were 132,000 bricks, at \$12 54 per

HISTORY, GOVERNMENT, AND GEOGRAPHY.

20. When and where did Washington resign his commission?
21. Where, and in what year, was the United States frigate Chesapeake boarded by the Leopard for the impressment of seamen?
22. The United States are now in what year of their independence?
23. When did the Constitution of the United States go into operation?
24. What is treason against the United States, and what is necessary to convict a person thereof?
25. In choosing a President of the United States by the House of Representatives, how many votes would the State of New York be entitled to?
26. Through what States would a line pass if drawn directly from New York to New Orleans?
27. Name the States and Territories of the United States bordering on Mexico?
28. Where is the island of St. Helena?

SYNTAX.

Write out the following sentences, making any corrections that may be necessary:

29. Who servest thou under?
30. All friendship between you and I are severed.
31. Every one should know his duty.
32. Is that him who you were speaking of?
33. Your note, with its inclosures, have been referred to the Bureau, agreeable to your request.
34. The ship rode out the storm beautifully.
35. Neither your letter or its accompaniments have any bearing on the subject.
36. I speak now of John Q. Adams, the greatest orator of the two, he who died in the Capitol.
37. If thy hand or thy foot offend thee, cut them off and cast them from thee.

ORTHOGRAPHY AND PUNCTUATION.

Copy the following passage clearly and legibly, correcting mistakes of orthography and punctuation, but not otherwise altering either the words or their order:

38. There is however a much more palperble violation of gramar. In the use of the virb was it falls uppon a grammatical ear like a hiddeous discord in waying such expresions. We must devest ourselves off evry vestage of revverance; for meer names poets orraters historyans critticks when throne into the grammatical crusabel come out simply as men. Striped off all adventicious ornaments you was insted of you ware in point of perpriaty stands on a parr with thou ware the orthoraty of addison. In maters of grammer of bentley who evadently never made english gramer his studdy of bolingbroke pope and others is as nothing nothing short of unaversel addoption before which all must bow can evver sancsion the expresion. You was, it can find no refuge but in ignorence or silley efectacion.

LETTER AND BRIEF.

39. Henry L. Bell, a member of the House of Representatives, writes, under date of December 6, 1872, to the Secretary of the Navy, recommending Thomas Lyons for a clerkship in the Navy Department.

You are required to draw up, for the signature of the Secretary of the Navy, a courteous, official reply, embodying the following points: Vacancy exists; why Mr. Lyons cannot be appointed; inclose civil-service rules and instructions for applicants; state when examination will take place, (fixing date yourself,) and the latest date at which applications for examination can be received, (allowing an interval of two weeks,) and refer him to inclosures for further information.

Fold the sheet, and indorse subject of inquiry and the answer in brief.

QUESTIONS IN CIVIL-SERVICE EXAMINATIONS IN THE
POST-OFFICE DEPARTMENT.

LETTER

FROM

THE POSTMASTER GENERAL,

RELATIVE TO

*The questions propounded by the examiners to candidates for appointments
and promotions in his Department.*

FEBRUARY 8, 1873.—Referred to the Committee on the Re-organization of the Civil
Service of the Government and ordered to be printed.

POST-OFFICE DEPARTMENT,
Washington, D. C., February 3, 1873.

SIR: I transmit herewith, in compliance with the resolution of the
House of Representatives of January 27, 1873, a copy of all the ques-
tions propounded by the examiners to candidates for appointments and
promotions in this Department.

Very respectfully, your obedient servant,

JNO. A. J. CRESWELL,
Postmaster-General.

HON. JAMES G. BLAINE,
Speaker of the House of Representatives.

*Copy of the questions used in competitive examinations held in the Post-
Office Department, under the rules and regulations for the civil service.*

LETTER-WRITING AND BRIEFING.

Examination for admission. Date of examination, July 15-19, 1872.

Write a letter addressed to the Postmaster-General, containing such facts in regard
to yourself as you desire to make known. Fold the letter and write on the back a
summary of the contents.

Examination for promotion. Date of examination, July 30, 1872.

Address a letter to the Postmaster-General upon the organization of the Post-Office
Department, and describe the duties belonging to the several bureaus, as far as your
acquaintance with such duties extends. Your proficiency in orthography and punctua-
tion will be determined principally by that letter; though errors in those branches, in
any part of the examination, will also be taken into account.

Examination for admission. Date of examination, September 30, October 1 and 2, 1872.

Address a letter to the Postmaster-General, stating where and when you were born, what educational advantages you have had, what business you have been engaged in, and such other facts in regard to yourself as you may desire to communicate. Sign the letter with your full name; give your post-office address; fold the letter and write on the back a brief or summary of the contents.

Examination for promotion. Date of examination, December 18, 1872.

Address a letter to the Postmaster-General, upon the organization and duties of the Office of the Second Assistant Postmaster-General. Describe what duties belong exclusively to the contract division, and what to the inspection division of that Bureau. State in what branch of the Office you have been employed, and for what length of time; what your particular duties are, and, briefly, what knowledge you have of the organization and duties of the Department generally. Fold the letter in the usual official manner for filing, and indorse on the back a summary of the contents.

Examination for promotion. Date of examination, January 7, 8, and 14, 1873.

Address a letter to the board of examiners, stating when and where you were born; of what State you are a citizen; what educational advantages you have had; what business or occupation you were engaged in before your appointment to a clerkship in the Post-Office Department; how long you have been in the Department; in what branch of it you are employed, and the nature of the duties upon which you are engaged. Fold the letter in a proper manner for filing, and write on the back of it your name, the date, and a brief of the contents.

Examination for promotion. Date of examination, January 13, 1873.

Address a letter to the Postmaster-General, upon the organization and duties of the Office of the Third Assistant Postmaster-General. State in what branch of the Office you have been employed, and for what length of time; what your particular duties are, and, briefly, what knowledge you have of the organization and duties of the Department generally. Fold the letter in the usual official manner for filing, and indorse on the back a summary of the contents.

Examination for admission. Date of examination, January 15-18, 1873.

Address a letter to the board of examiners, stating any facts you may desire to communicate in regard to yourself; fold the letter, and write on the back a brief or summary of its contents.

GRAMMAR.

Examination for promotion. Date of examination, June 17, 1872.

State, in your own words, briefly, the nature and object of punctuation.

Correct the punctuation of the following extract:

"Men of superior genius; while they see the rest of mankind, painfully struggling, to comprehend obvious truths; glance, themselves, through the most remote consequences; like lightning through a path, that cannot be traced; they see the beauties of nature, with light and warmth, and paint them forcibly, without effort; as the morning sun, does the scenes he rises upon; and in several instances communicate to objects, a morning freshness, and unaccountable luster, that is not seen in the creations of nature, the poet, the statuary, the painter; have produced images that left nature far behind."

Correct the following sentences:

He entreated my companion and I to live harmonious.

Associate not with those who none can speak well of.

I intended to have answered your letter yesterday.

The court of chancery frequently mitigates and breaks the teeth of the common law.

ORTHOGRAPHY AND PUNCTUATION.

Examination for admission. Date of examination, July 15-19, 1872.

Write out the following extract; correct the defective spelling, and insert the proper punctuation marks. The paragraphing is defective; correct what is erroneous in that particular:

In the grate skale of Society there is a continued rise from one Excelence to another Excelence internal or external, intelectual and morale.

Wherever we may fix there is still some one whom we may find Superior or Inferior and these Relations are mutually convertible as we ascend or descend the Shrub is taller than the Flower which grows in its Shade The Tree than the Shrub the Rock than the Tree the mountain than the single Rock and above all the Sun and the Heavens it is the same in the World of Life.

From that all mighty being who is the Source of Life to the lowest of his Creatures what innumerable gradations may be traced even in the Ranks of Excellence on our own Earth each being higher than that beneath and lower than that above.

And thus all to all objects at once of Pride or Humility according as the comparison may be made with the Greater or the Less.

GRAMMAR.

Examination for admission and promotion. Date of examination, July 15-19, 1872, and July 8, 1872.

1. What is a sentence?
2. What is the difference between a simple and a compound sentence?
3. In the following sentences, what part is the predicate and what the nominative?

"The roses were in bloom."

"The air, the earth, the water, teem with delighted existence."

4. What is the meaning of the term "case," as used in grammar? Give the answer in your own language.

Correct such of the following sentences as are defective; write them as they should be expressed:

5. He died with violence being killed by a sword.
6. He was so ill that he could not set up at all, but had to lay in bed all the time.
7. What we do secret shall be seen and heard in the clearest light.
8. Many act so directly contrary to this method, that from a habit of saving time and paper, which they acquired at college, they write so little that they can hardly read it themselves.
9. On receiving this information, he arose, went out saddled his horse, mounted him and rode to town.
10. They begin to extol the farmer's, as they call him, excellent understanding.
11. Genius lies buried on our mountains and in our valleys.
12. The latest posterity will listen with as much, or even greater pleasure than their contemporaries.
13. Man is not such a machine as a clock or a watch, which move merely as they are moved.
14. Much depends upon this rule being observed.
15. I wish to cultivate a further acquaintance with you.
16. The covetous man never has a sufficiency; although he has what is enough for nature.*

Examination for promotion. Date of examination, July 30, 1872.

What is a finite verb?

What is meant by the voice of a verb?

In what voice is the verb in the sentence, "The pitcher was broken at the well?"

Of how many words may a verb consist?

What are the principal parts of a simple sentence?

What is meant by concord and government, as used in grammar?

Write the following sentences, taking care to correct, in so doing, every error you may discover. [Some of these sentences contain violations of the rules of syntax; some are defective as regards perspicuity and accuracy of expression, and others are redundant, deficient, or improperly arranged in regard to the relation of words or members.]

Some men think exceedingly clearly, and reason exceedingly forcibly.

The history of Peter is agreeable with the sacred texts.

This dedication may serve for almost any book, that has, is, or shall be published.

I feared that I should have lost it before I arrived at the city.

I had rather walk than ride.

Hope, the balm of life, darts a ray of light through the thickest gloom.

When favors of every kind are conferred speedily, they are doubled.

These arts have enlightened, and will enlighten, every person who shall attentively study them.

* Nos. 1-12 of this series, numbered in red, used in examination for promotion, July 13, 1872.

Nos. 5, 6, 7, 8, 10, 11, 12, 13, 14, and 16, used in examination for promotion, January 13, 1873.

We were at the fair, and saw everything there.

Never did man succeed better in gaining the universal love and esteem of all men.

There can be no doubt but that he seriously means what he says.

I am honestly, truly, seriously and unalterably of opinion, that nothing can possibly be more incurably and emphatically dangerous and destructive, or more decisively fatal, to a kingdom, than the introduction of thoughtless dissipation, and the proud pomp of lazy luxury.

Though energetic brevity is not adapted alike to every subject, we ought to avoid its contrary, on every occasion, a languid redundancy of words. It is proper to be copious sometimes, but never to be verbose.

Examination for admission. Dates of examination, September 30, and October 1 and 2, 1872.

Arrange the words in the following sentence under appropriate headings, designating the part of speech to which each word belongs :

"The power of speech is a faculty peculiar to man, and was bestowed upon him by his beneficent Creator for the greatest and most excellent uses; but alas! how often do we pervert it to the worst of purposes."

What is a participle?

Examination for admission. Dates of examination, September 30, and October 1 and 2, 1872.—Examination for promotion. Dates of examination, December 18, 1872, and January 14, 1873.

Write the following sentences, taking care to correct, in so doing, all the errors you may discover; if you do not detect any, say so, without rewriting the sentence:

Him and me belongs to the same club.

That is the person whom we think deserves the reward.

His brother-in-laws were educated at the same school.

Fusion is where a solid is converted into a liquid by heat.

The lot is 25 foot front and 8 rod deep.

Will it be urged that these books are as old, or even older than tradition?

There was a chance of him recovering his senses.

If any member of the congregation wish to connect themselves with this church, they will please come forward while the brethren sings.

Examination for promotion. Dates of examination, January 7 and 8, 1873.—Examination for admission. Dates of examination, January 15-18, 1873.

Rewrite the following sentences, taking care to correct, in so doing, all the errors, of whatever kind, you may discover in them. If you do not detect any, say so, without copying the sentence:

We were all sitting round the fire.

I expect it rained last night.

I seen the limb tore off.

To refrain from luxuries is better than going in debt for them.

Knowing him for many years, I confidently recommend him.

He knew not which to most admire.

Thought and language act and re-act upon each other mutually.

How can I distinguish the good from bad?

In England, every one is free as soon as they touch the land.

The British constitution stands, like an ancient oak in the woods, among the nations of the earth, which, after having overcome many a blast, overtops the other trees of the forest, and commands respect and veneration.

ARITHMETIC.

Examination for promotion. Dates of examination, July 8 and 13, 1872, and January 13, 1873.

(Give the work in full, and before the answer write plainly, *Answer*.)

Multiply the sum of $2\frac{7}{8}$ and $1\frac{1}{2}$ by their difference, and express the result decimally.

What decimal part of a year is $9\frac{1}{2}$ months?

A note of \$680, being on interest at 4 per cent., amounted to \$727.60; how long was it on interest?

What is the discount, at 6 per cent. per annum, on \$172.86, due 3 years and 4 months hence?

The pay on a certain route is \$2,525.53 per annum, and the whole distance 89 miles; there is 6 times a week service on 27 miles, 3 times a week on 45 miles, and twice a week on 17 miles: how much additional per annum will it cost, *pro rata*, to double the 3 times a week service?

What per cent. of the original cost would the *pro rata* for the increased service be in the above case?

If, on the same route, the semi-weekly service should be discontinued, what sum would be saved, and what per cent. would that sum be of the original pay?

What difference is there between the *interest* of \$2,260, at 6 per cent. per annum, for 5 years, and the *discount* of the same sum for the same time and rate per cent.?

Examination for promotion. Date of examination, June 17, 1872.

If $\frac{3}{4}$ is the numerator of the following fraction, $\frac{\frac{3}{4}}{\frac{1}{2}}$, what is its value when reduced to a simple fraction?

P. Thomas had \$8,000; he gave 19 per cent. of it to his wife, 37 per cent. of the remainder to his sons, and \$2,000 to his daughters; what had he left?

What principal will gain \$5.11 in 3 years and 6 months at 9 per cent.?

What is the bank discount on \$478 for 60 days?

Examination for admission. Dates of examination, July 15-19, 1872.

Put down in figures, one hundred and nine millions eight hundred and seventy-six thousand five hundred and forty-three.

Write in words 127894237867.

Add up the following figures and give the amount:

126798642785
762423954723
546278627482
154327562741
243462746567

212162401307
121242310217
241647267118
912423217409

Multiply 8010700 by 9000909.

Divide 345678901765 by 4007.

Examination for admission. Dates of examination, July 15-19, 1872.—Examination for promotion. Date of examination, July 30, 1872.

Add $\frac{1}{2}$, $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, $\frac{5}{6}$, $\frac{6}{7}$, and $\frac{7}{8}$.

Subtract $\frac{1}{11}$ from $\frac{1}{11}$ of $\frac{1}{11}$.

Multiply $\frac{1}{17}$ by $\frac{1}{6}$.

Divide $\frac{1}{4}$ by 9.

Divide $\frac{1}{8}$ by $\frac{2}{3}$.

Add 151.01, 611111.01, 16.5, 6.7, 46.1, and .67896.

Multiply 47.01 by 047.

Divide 9811.0047 by .108649.

Divide 13 by $\frac{3}{4}$.

The nominal value of a share in B. & M. R. R. is \$100; if I purchase 17 shares at 15 per cent. below the nominal value, and sell them for 15 per cent. above, what do I gain?

What is the interest of \$1,165.50 for 5 years, 3 months, and 9 days, at 7 per cent. per annum?

How long must \$98 be on interest, at 8 per cent., to gain \$25.48?

A note of \$500, being on interest 2 years and 6 months, amounted to \$550; what was the rate per cent.?

S. Jones gave his note for \$375.75, dated October 4, 1842, payable to J. Wills, or order, January 1, 1844; what was the value of the note at the time it was given?

On a route 85 miles long, there is, on 28 miles, 6 times a week service; on 37 miles,

* This example used only July 30, 1872.

3 times a week service, and on 20 miles, twice a week service. The pay for the whole service is \$2,871 per annum. What sum would be saved by making the service 3 times a week over the whole route, at *pro rata* deduction of pay?

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.—Examination for promotion. Date of examination, January 14, 1873.

Add up the following figures, and, in your answer, give the amount only:

10392280

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.—Examination for promotion. Date of examination, December 18, 1872, and January 14, 1873.

Add up the following numbers, and in your answer give the entire work:

Three and eighteen ten thousandths; one thousand five, and twenty-three thousand forty-three millionths; eighty-seven, and one hundred seven thousandths; forty-nine ten thousandths; forty-seven thousand, and three hundred nine hundred thousandths.

Write out in words the following figures:

30316710. 2345678

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.—Examination for promotion. Date of examination, December 18, 1872.

In your answer to the following questions give the work in full, and opposite the answer write plainly, *answer*. Common fractions must in all cases be reduced to their lowest terms, and decimals, where there is a remainder, must be carried out to four places at least.

Divide seventy-five, and sixteen hundredths, by five, and forty-two thousand eight hundred one hundred thousandths.

A man purchased a house and lot for \$10,000, on the following terms: \$5,000 cash, \$2,500 in three months, and the balance in six months; what was the cash value of the property, interest being reckoned at 6 per cent.?

Examination for admission. Date of examination September 30, and October 1 and 2, 1872.—Examination for promotion. Date of examination, December 18, 1872, and January 14, 1873.

Add $\frac{1}{3}$ of $\frac{3}{4}$ of $\frac{1}{2}$, to $\frac{1}{2}$ of $\frac{2}{3}$.

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.—Examination for promotion. Date of examination, December 18, 1872.

If a yard of muslin be bought for $37\frac{1}{2}$ cents, and sold again for 32 cents, what is the loss per cent.?

If \$1,000, at $4\frac{1}{2}$ per cent. per annum, amounts to \$1,281.25, how long was it at interest?

A certain mail-route is 57 miles long; on 25 miles of it the mail is carried six times a week; on 17 miles, 3 times a week, and on 15 miles, twice a week. The pay is \$1,617 per annum. What would be the additional cost per annum, *pro rata*, to increase the service to six times a week, over the entire route?

Examination for promotion. Date of examination, January 7 and 8, 1873.—Examination for admission. Date of examination, January 15-18, 1873.

In your answers to the following questions give the work in full, and opposite the answer write plainly, *answer*. Common fractions must be reduced to their lowest terms, and decimals, if there is a remainder, must be carried out to four places.

A railroad-route, on which the pay was \$75 per mile per annum, was extended, at different times, $3\frac{1}{2}$ miles, $7\frac{1}{2}$ miles, and $9\frac{1}{2}$ miles. What was the whole extension and the whole cost? Give the distance in miles and common fractions of miles, and the cost in dollars and common fractions of dollars.

Add fifty-six thousand and fourteen thousandths, nineteen, and nineteen hundredths, fifty-seven and forty-eight ten thousandths, twenty-three thousand five and four-tenths, and fourteen millionths.

Divide five hundred and sixty-seven thousand eight hundred and ninety-one millionths, by eight and two-tenths.

What is the bank discount of a draft of \$1,350.50, payable in one year and four months, at 5 per cent.?

A mail-route, 62 miles in length, had 6 times a week service on 24 miles, 3 times a week on 32 miles, and twice a week on 6 miles. The annual pay was \$1,953. The service was raised to 6 times a week, over the whole route, at *pro rata* additional pay. Afterwards the route was curtailed 27 miles, at *pro rata* deduction of pay; what was the pay after that curtailment?

BOOK-KEEPING.

Examination for promotion. Date of examination, June 17, 1872.

John Quinn, a disbursing officer, receives from the Treasury on the 1st January, 1872, \$50,000. He has a salary of \$2,000 per annum, and a commission of 3 per cent. on his disbursements. On the 1st February he pays out \$20,000, for which he has proper vouchers. On the 1st March he pays out \$20,000, and on the 15th \$5,000, taking receipts. On the 31st he pays his own salary for the quarter, and retains the commission on his disbursements, except his own salary. State his account with the United States for the quarter ended 31st March, 1872.

Examination for promotion. Date of examination, July 8 and 13, 1872; January 13, 1873.

Thomas Brown is contractor on route No. 79821, at \$4,000 per annum. In April he lost a mail-pouch, for which he was fined \$25. May 1, 3, 8, 10, 15, 17, he failed to convey the mail at all, and a deduction was made of \$307.68. June 10 he was fined \$10 for employing a carrier under age. June 12, 14, 21, he failed to take the mail, and \$153.84 was deducted from his pay. June 30 an order was made to remit \$100 of the deduction made in May. In July he collected from the postmasters on the route the sum of \$350, and forwarded acknowledgments to that amount.

State his account with the United States for the quarter ended June 30.

Examination for admission. Date of examination, July 15-19, 1872.—Examination for promotion. Date of examination, July 30, 1872.

John Brown, a disbursing officer, has the sum of \$20,000 placed in his hands on the 1st January, 1872, to make certain payments on public account. His salary is \$2,000 per annum, and he is allowed a commission of 3 per cent. on the amount paid out. He pays out \$15,000, for which he has proper vouchers, and out of the balance retains his salary for the quarter and his 3 per cent. commission.

State his account with the United States for the quarter ending March 31, 1872.

Examination for admission. Date of examination, September 30 and October 1 and 2, 1872.—Examination for promotion. Date of examination, December 18, 1872; January 14, 1873.

John Pratt, a disbursing officer of the Government, has in his hands on the 1st April \$9,782. On the 15th he receives \$5,428 more from the Treasury, and on the same day he pays out \$5,275, on which he is entitled to a commission of $2\frac{1}{2}$ per cent. On the 1st May he pays the salaries of two clerks for the month of April, at the rate of \$1,000 per annum each, and on the 21st he pays out \$5,420, on which he is allowed a commission of $3\frac{1}{4}$ per cent. On the 1st June he pays his clerks their salaries, as above, for the month of May, and on the same day he receives a further sum from the Treasury of \$2,500.

State his account with the United States. Rule and head the paper on which the statement is made in a manner proper for that purpose.

Examination for promotion. Date of examination, January 7, 8, 1873.—Examination for admission. Date of examination, January 15-18, 1873.

John Jones, postmaster at Brownsville, Maine, on the 30th June, 1870, was debtor to the United States in the sum of \$875.96; on the 15th July he paid draft against him of \$750; on 20th July he received postage-stamps amounting to \$1,420, of which \$175.86 worth were returned, damaged, to the Department, and the balance sold during the quarter; on the 1st August he advanced \$55, and again on the 15th August \$20 on his clerk's salary, rated at \$900 per annum; on 1st September he paid draft against him of \$800; on 10th September he collected draft against a neighboring postmaster for \$325, and on 15th September another for \$175; on 30th September he paid balance of salary due his clerk for the quarter, (three months,) also his own quarterly salary, at the rate of \$2,100 per annum, deducting the income tax of 5 per cent., charged on the excess above \$2,000 a year. During the quarter he collected \$17.50 for unpaid postages on letters received; \$27.30 for newspaper postages; \$130 for box-rents, and \$8 for twine and waste paper sold.

State his account with the United States, in form, up to and inclusive of September 30, 1870.

HISTORY.

Examination for promotion. Date of examination, June 17, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

What event in American history is known as the Boston Tea Party?

Who was President of Congress at the time of the Declaration of Independence?

What difficulty occurred between the United States and France soon after the close of the Revolution?

Did any actual hostility take place between the two countries?

What brought on the war with England in 1812?

What battle was fought after the treaty of peace had been signed?

Examination for promotion. Date of examination, July 8 and 13, 1872; January 13, 1873.

Name the original thirteen States.

What two States at first dissented from the Constitution and were the last of the thirteen to adopt it?

Examination for promotion. Date of examination, July 8 and 13, 1872.

When was the Constitution formed; when adopted, and when did it go into effect?

Examination for promotion. Date of examination, July 8 and 13, 1872; January 13, 1873.

Who was the first Vice-President?

Examination for promotion. Date of examination, July 8 and 13, 1872.

Who was the first Secretary of State?

Who was Alexander Hamilton?

What two ex-Presidents died on the same day, and what day was it?

During what administration did two great political parties first arise in the United States; what names were they known by; what produced them, and what was the difference between them?

Who was Vice-President under President Monroe, and how long did he serve?

What American general, in the war of 1812, surrendered his whole army, and was sentenced to be shot for cowardice?

What Vice-Presidents were afterwards elected President?

When were slaves first introduced into the United States, and from what date was the slave-trade abolished?

Examination for promotion. Date of examination, July 30, 1872.

What was the nature of the *Stamp Act* passed by the British Parliament in 1765?

In what city did the Colonial Congress assemble, and what action was taken in regard to the *Stamp Act*?

When and where did the first inauguration of the first President of the United States take place?

What two Presidents of the United States had the same surname, and what relationship existed between them?

Under whose administration, and at what price, was Louisiana purchased from the French?

For what reason was the sum of two millions and a half of the purchase-money in the above transaction withheld by the United States?

Why was it that Vermont was not admitted into the Union until the Revolution was over, notwithstanding she bore so conspicuous a part in that struggle?

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.

What was the first State admitted into the Union after the adoption of the Constitution?

Who was President of the United States during the war with Mexico?

Who was Speaker of the House of Representatives when John Quincy Adams was elected President of the United States?

Examination for promotion. Date of examination, December 18, 1872; January 14, 1873.

In what manner was John Quincy Adams elected President of the United States?

Examination for promotion. Date of examination, January 7 and 8, 1873.—Examination for admission. Date of examination, January 15-18, 1873.

Who commanded the British forces at the battle of New Orleans?

Who was Tecumseh?

Under whose administration was Florida ceded to the United States?

GEOGRAPHY.

Examination for promotion. Date of examination, June 17, 1872.

How many States are there in the Union?

What United States territory is separated from Asia by Behring's Strait?

What region is known as the valley of the Mississippi?

Name the States and Territories bordering on British territory, commencing at the east.

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

Where do the Rocky Mountains enter the United States, and in what general direction do they run?

In what State do the Alleghany Mountains begin, in what general direction do they run, and in what State terminate?

Name two or three of the principal ridges of the Rocky Mountains.

Name two or three of the principal ridges of the Alleghanies, and name the States in which they are situated.

What part of the United States is the Atlantic slope? Pacific slope?

Examination for promotion. Date of examination, July 13, 1872, and January 13, 1873.
Examination for admission. Date of examination, July 15-19, 1872.

What is the source of the Mississippi?

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

What is the chief affluent of the Mississippi; and what are its principal tributaries from the east, and what from the west?

Name the principal rivers east of the Alleghanies.

What is the smallest State in the Union?

In what zone are the United States located?

Examination for promotion. Date of examination, July 30, 1872.

What are the tropics?

What is a zone? Name all of them.

How much of the earth's surface is land?

Name the grand divisions of the land.

Examination for promotion. Date of examination, July 30, December 18, 1872, and January 14, 1873.

What are the two great water-sheds of the United States?

Examination for promotion. Date of examination, July 30, 1872.

Which one of the great lakes lies wholly within the United States?

What is the highest mountain peak in North America?

Examination for admission. Date of examination, September 30, and October 1 and 2, 1872.

Bound the State of Indiana.

Where is Mount Washington?

What is the capital of Wyoming Territory?

Where does the Connecticut River rise, in what direction does it flow, and into what body of water does it empty?

Examination for promotion. Date of examination, January 7 and 8, 1873.—Examination for admission. Date of examination, January 15-18, 1873.

Are the great lakes situated wholly within the United States?

Where is Lake Champlain?

Name the Middle States.

Where do the Rocky Mountains enter the United States?

In what State do the Alleghany Mountains begin?

GOVERNMENT.

Examination for promotion. Date of examination, June 17 and July 30, 1872.

What is the form of the Government of the United States?

How is the President chosen?

What are the three co-ordinate branches of the Government?

How are Senators chosen?

Why has Delaware as many Senators as New York?

Can a bill become a law without the approval of the President?

What is the treaty-making power?

In case of the death of the President and Vice-President, upon whom would the presidential duties and powers devolve?

What is the distinction between a State and a Territory?

Why are not the Territories represented in the Senate as well as in the House?

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

What are the constitutional qualifications for a Senator of the United States in regard to age and citizenship?

Under the United States form of government, in whom is the sovereignty vested?

What is the supreme law of the land?

Can a Senator or Representative be impeached?

What are the constitutional qualifications for the office of President in respect to nativity, age, and residence?

In what case can the President adjourn Congress?

Examination for promotion. Date of examination, July 8 and 13, 1872, and January 13, 1873.—Examination for admission. Date of examination, July 15-19, 1872.

What limitation is there to the pardoning power of the President?

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

Where is the judicial power of the United States vested?

Examination for promotion. Date of examination, July 8 and 13, 1872, and January 13, 1873.—Examination for admission. Date of examination, July 15-19, 1872.

Is the power of Congress absolute or limited?

Can the Senate present articles of impeachment?

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, January 15-19, 1873.

How may amendments to the Constitution be proposed?

Examination for promotion. Date of examination, July 8 and 13, 1872, and January 13, 1873.—Examination for admission. Date of examination, July 15-19, 1872.

What proportion of the States is necessary to ratify an amendment?

Examination for admission. Date of examination, July 15-19, 1872.

What is the first amendment?

Examination for promotion. Date of examination, July 8 and 13, 1872.—Examination for admission. Date of examination, July 15-19, 1872.

What are the reserved rights of the States?

What is the distinction between direct and indirect taxes?

Examination for admission. Date of examination, September 30 and October 1 and 2, 1872.

Where is the executive power of the United States lodged?

Is there any express power given to Congress to add new territory to the United States?

NOTE.—This question also used for examination for promotions, December 18, 1872, and January 14, 1873.

Has the President any authority to declare war?

Examination for promotion. Date of examination, January 7 and 8, 1873.—Examination for admission. Date of examination, January 15-18, 1873.

For what term do the judges of the Supreme Court hold their offices?

Is there any *legislative* power vested in the President?

Can an officer of the United States, under any circumstances, accept a present or a title from a foreign government?

What difference is there between the oath of office required to be taken by the President of the United States and that required of other officers of the Government?

QUESTIONS IN CIVIL-SERVICE EXAMINATIONS—TREASURY
DEPARTMENT.

L E T T E R

FROM

THE SECRETARY OF THE TREASURY,

RELATIVE TO

The questions propounded by the examiners to the candidates for appointments and promotions to clerkships in his Department.

FEBRUARY 8, 1873.—Referred to the Committee on Civil Service and ordered to be printed.

TREASURY DEPARTMENT,
Washington, D. C., February 1, 1873.

SIR: In reply to so much of the resolution offered by Hon. B. F. Butler, January 27, 1873, as follows:

* * * * *
* * * * *
“Resolved, That the Secretary of the Treasury, * * * * *
* * * * * be, and they are hereby, directed
to furnish this House with a copy of all the questions propounded by
the examiners to the candidates for appointments and promotions to
clerkships in their respective Departments,” I have the honor to inclose
herewith a complete set of the questions used in the twenty-eight ex-
aminations for admission and promotion held by the Civil-Service Board
of the Treasury Department, from the commencement of operations un-
der the civil-service regulations to the 31st day of January.

Very respectfully, your obedient servant,

GEO. S. BOUTWELL,
Secretary.

HON. JAMES G. BLAINE,
Speaker House of Representatives.

THE SECRETARY OF THE TREASURY
WASHINGTON

DEPARTMENT OF THE TREASURY
WASHINGTON

LETTER

TO

THE SECRETARY OF THE TREASURY

WASHINGTON

The enclosed copy of the report of the Committee on the
Finance of the United States is herewith transmitted.

Very respectfully,
Your obedient servant,

THE SECRETARY OF THE TREASURY
WASHINGTON

Enclosed for the Secretary of the Treasury is a copy of the report of the Committee on the Finance of the United States, as transmitted to the Senate on January 1, 1875, and as approved by the Senate on January 1, 1875. The report contains a full and complete statement of the financial condition of the United States, and of the means for the improvement of the same. It also contains a full and complete statement of the means for the improvement of the same. The report is a valuable and important document, and it is hoped that it will be of great service to the Government.

Very respectfully,
Your obedient servant,

THE SECRETARY OF THE TREASURY
WASHINGTON

QUESTIONS USED IN TWENTY-EIGHT CIVIL-SERVICE EXAMINATIONS IN THE TREASURY DEPARTMENT FROM JUNE 5, 1872, TO JANUARY 31, 1873.

Extracts from regulations governing admission to the Department.

VIII. All candidates for appointment to clerkships of class one, who shall appear in accordance with such notification, will be subjected to a public competitive written examination upon the following subjects:

(1) Penmanship; (2) writing and briefing letters; (3) elements of English grammar, chiefly orthography and syntax; (4) arithmetic: fundamental rules, fractions, percentage, interest, and discount; (5) elements of accounts and book-keeping; (6) history and geography: general questions, principally such as relate to the United States; and (7) prominent features of the Government of the United States.

IX. The various subjects of the examination may be subdivided, if thought desirable, into classes, and to each subject or class a relative weight, according to its importance in the examination, will be assigned by each board of examiners. The mode of ascertaining the result of the examination will be as follows: The degree of accuracy with which each question shall be answered will first be marked by the board on a scale of 100. The average of the marks given to the answers to the questions in each subject or class will next be ascertained. Each average will then be multiplied by the number indicating the relative weight of the subject or class, and the sum of the products will be divided by the sum of the relative weights; the quotient will determine the candidate's standing in the examination. Relative weight will be assigned not merely to the special qualifications of the candidates, but to their general aptitude as shown in the course of the examination.

Candidates will be examined during office-hours, and in no case will their examination be continued more than one day.

Extract from regulations governing examinations for promotion.

II. The examination will be held upon the general subjects fixed for examinations for clerkships of class one, and upon such other subjects as the general nature of the business of the department or office, and the special nature of the position to be filled, may seem to the board of examiners to require. Due weight will be given to the efficiency with which the several candidates shall have previously performed their duties in the Department; but no one who shall fail to pass a minimum standard of sixty *per centum* in the written examination will in any case be certified for appointment.

The following scale of relative weights was used in all the examinations for appointments to clerkships of class one:

Subject and class.	Relative weight.
Arithmetic:	
Notation and numeration	1
Addition	1
Miscellaneous questions	6
Accounts	2
History, geography, and government	2
Grammar:	
Orthography	4
Syntax	4
Punctuation	1
Letter and brief	1
Penmanship	4
	26

The following was used in the examination for Deputy Comptroller of the Currency:

Subject and class.	Relative weight.
Arithmetic:	
Miscellaneous questions	6
Accounts	3
History, geography, and government	3

	Subject and class.	Relative weight.
Grammar:		
Orthography		4
Syntax		4
Punctuation		1
Letter and brief.....		2
Penmanship.....		2
Questions pertaining to office		15
Efficiency		10
		50

The following was used in the examination for head of division, Office of Internal Revenue:

	Subject and class.	Relative weight.

EXAMINATION No. 1.—PROMOTION.

OFFICE OF THIRD AUDITOR, *June 5, 1872.*

1.

* Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given on the page opposite the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth ?
5. State briefly as to elementary education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?

* The restriction as to the time to be used for each paper was applied in only the first four examinations.

8. State in what division of the office you have been employed, and the character of the duties you have performed.

2.

Ten minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given on the page opposite the questions to which they pertain

9. Write in figures the following numbers:

One thousand and one.

Seventy-five thousand five hundred and fifty.

One hundred and ten and decimal one-hundredth.

10. Write at length the numbers expressed by following figures:

20,050.

4,002,010.

.112.

2,004.204.

3.

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

11. Add the following columns of figures, and give the answer immediately under the column to which it pertains:

37,640,787 95
109,741,134 10
209,464,215 25
309,226,813 42
266,027,537 43
191,087,589 41
158,356,460 86
311,533 83
194,572 32
24,709 46
118,248 30
92,718 50
150,476 14
103,880 82
149,004 15
175,111 81

37,640,787 95
109,741,134 10
209,464,215 25
309,226,813 42
266,027,537 43
191,087,589 41
158,356,460 86
311,533 83
194,572 32
24,709 46
118,348 30
92,718 50
150,476 14
103,880 82
149,004 15
175,111 81
193,636 59
269,803 41
315,022 36
205,217 87
379,558 23
384,720 19
445,485 18
464,546 52
427,124 98
337,032 62
315,783 47
457,919 66
509,113 37
738,949 15

4.

Forty-five minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given on the page opposite the questions to which they pertain.

Express the answers decimally, and show the operation in each case.

12. A quartermaster purchased 20 tons of hay, at \$10.50 per ton; 1,575 pounds of corn, at $87\frac{1}{2}$ cents per bushel, (56 pounds to the bushel;) 1,956 pounds of oats, at $37\frac{1}{2}$

8.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given on the page opposite the questions to which they pertain.

20. When and by whom was America discovered?

 337,032 62
 315,783 47
 457,919 66
 509,113 37

4.

Forty-five minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

12. John Smith renders an account-current as postmaster at Smithville, New York from April 1 to May 20, 1872, and Thomas Brown from May 21 to June 20, 1872. What amount of compensation should be credited to each, the annual salary of the office being \$1,800?

13. A disbursing-agent receives \$11,724.83. He pays out \$4,096.48, and the residue he disburses to five sub-agents, as follows: The first receives a fourth part, and the remainder is divided equally among the others. What was the share of each?

5.

Fifty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

14. A quartermaster bought $5\frac{2}{3}$ cords of wood at one time, and 24 $\frac{5}{6}$ cords at another. After issuing 16 $\frac{7}{9}$ cords, how much remained?

15. What amount is due a mail-contractor for the quarter ending June 30, his contract pay being \$1,125 per annum, pay increased \$639 per annum from May 2?

16. What amount is due a mail-contractor for the quarter ending December 31, contract pay \$725 per annum, pay decreased \$369 per annum from November 1, and increased \$248 per annum from November 16?

6.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

17. The total population of four western towns in 1860 was 40,000. The number of inhabitants in the first was 22,000, in the second 11,000, in the third 5,000, and in the fourth 2,000. In 1870 the total population of the towns had increased 25 per cent. What was the population of each town in 1870?

18. If the premium on gold is $15\frac{1}{8}$ per cent., what amount of gold must I sell to pay a note of \$165 in currency?

7.

Thirty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed within less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

19. William Brown, postmaster at Brownsville, Indiana, transacts the following business on money-order account, viz :

Issues money-orders amounting to.....	\$51,125 75
Collects fees on same	51 50
Transfers from postage account	515 00
Pays money-orders amounting to.....	25,009 15
Repays money-orders amounting to	112 18
Transfers to postage account.....	515 00
Deposits surplus funds.....	20,000 00

The postmaster is entitled to the following commissions, viz: one-third of the fees collected on orders issued, and one-fourth of one per cent. on the aggregate amount of orders paid.

Make a statement of his account in the form on the opposite page, showing balance due the United States.

[illegible]

8.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. When and where was the first battle of the Revolution fought?

21. When and where did the first continental Congress meet?

22. When and where did the surrender of General Lee take place?

23. Who was the fifth President of the United States?

24. What proportion of the States is required to ratify an amendment to the Constitution?

25. After a bill, passed by Congress, has been vetoed by the President, can it become a law? If so, in what manner?
26. Describe the duties of the Vice-President of the United States.
27. About what is the population of the United States?
28. Where is Chesapeake Bay?
29. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

Twenty-five minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it on the examiner's desk.

30. Copy the following and correct the orthography and punctuation:

Each subdivision reports weekly to the cheaf exsaminor, and monthly, through that ofiser to the cheef clerk the proggres of the work. so that the egsact ammount of work done by each clerk is cleerley asertaned.

all vouchers; relitive to allowances; made by the Post-offis-department for clerke hier lites fewil rent stationary &c at post Offises of the 1st and 2d Classes are forwardid at the begining of each quarter to the chief examinar and his asistent for exs-amination a staitment is then prepared showing the vouchers-recieved the ammount-alowed and the ammount suspended when found to be in exses of the allowance. on reciept of the returns, from the examinars these acounts are reviewed and, the amount allowable addid and, the ballance drawn by the chief examinar.

10.

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

31. Correct the following sentences:

The happy effects of this fable is worth attending to.

The arrows of calumny fall harmlessly at the feet of virtue.

Which dictionary do you prefer, Worcester or Webster's?

Some systems, so far from making men better, have a tendency to make him worse.

He instructed and fed the crowds who surrounded him.

They took possession of the heights where the enemy had laid.

Nenter verbs neither act upon or govern nouns and pronouns.

Poverty and obscurity will oppress him only who esteem it oppressive.

11.

One hour and thirty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

32. Answer the following letter, and fold and brief your reply:

TREASURY DEPARTMENT, *Washington, June 1, 1872.*

Hon. J. J. MARTIN, *Auditor of Treasury for Post-Office Department:*

SIR: I have the honor to request that you will furnish me with the following information, which I desire to use in my forthcoming report:

1. What duties are assigned by law to the Auditor of the Treasury for the Post-Office Department?

2. Are the settlements and decisions of the Auditor final? If not, to what officer does an appeal lie?

3. Into what divisions is that Bureau divided?

4. State briefly the work assigned to each division.

5. How and by whom is the Auditor's office notified of changes of postmasters made by the Postmaster-General?

6. How notified, and by whom, of contracts executed for transportation of the mails and furnishing supplies for the Post-Office Department, and orders for the Postmaster-General extending, curtailing, or annulling the same?

7. Explain the difference between an Auditor's draft and a Postmaster-General's draft.

Very respectfully,

GEO. S. BOUTWELL,
Secretary.

EXAMINATION No. 3.—PROMOTION.

OFFICE OF COMMISSIONER OF CUSTOMS,
June 6, 1872.

1.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately after the questions to which they pertain.

1. Name.
2. Residence.
3. Place of birth.
4. Date of birth.
5. State, briefly, as to elementary education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you have been employed, and the character of the duties you have performed.

2.

Ten minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write, in figures, the following numbers:

Three thousand and forty-two.

Twelve millions and twenty-one.

One hundred and two, and decimal eleven-hundredths

10. Write at length the numbers expressed by the following figures:

200, 050

25, 200, 001

2, 301

23, 021. 43

3

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer under the column to which it pertains:

37,640,787.95	37,640,787.05
109,741,134.10	109,731,134.10
209,464,215.25	209,464,215.25
309,226,813.42	309,226,813.42
266,027,537.43	266,027,537.43
191,087,589.41	191,087,589.41
158,356,460.86	158,356,460.86
311,533.83	311,533.83
194,572.32	194,572.32
24,709.46	24,709.46
118,248.30	118,248.30
92,718.50	92,718.50
150,476.14	150,476.14
103,880.82	103,880.82
	149,004.15
	175,111.81
	193,636.59
	269,803.41
	315,022.36
	205,217.87
	379,559.23
	384,720.19
	445,485.18
	464,546.52
	427,124.98
	337,032.62
	315,783.47
	557,919.66

4.

Forty-five minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

12. The Treasury Department bought on contract 500 reams of foolscap-paper, at \$3.87½ per ream, 50½ reams of which were returned as unsuitable. Also 325 reams of letter-paper, at \$2.62½ per ream, 25½ reams of which were rejected. How much was paid for the remainder?

13. A disbursing agent receives \$10,724.83. He pays out \$4,000.48, and the residue he disburses to five sub-agents, as follows: The first receives a fourth part, and the remainder is divided equally among the others. What was the share of each?

5.

Fifty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

14. The duty on proof brandy is \$2 per gallon, and in proportion for greater strength. What is the duty on brandy of 70° strength, on a scale of 50°?

15. What is the duty, at 6½ cents per yard and 12 per cent. *ad valorem*, on 350 yards of cotton goods costing 20 cents per yard, with the usual addition of 2½ per cent. for commissions?

16. James Brown was appointed an officer of the Treasury at a salary of \$3,000 per annum on the 3d of June, 1871. He retired August 15, 1871. To how much pay was he entitled, both days being included?

6.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation in each case.

17. An officer of the United States deposits in the Treasury \$35,000, having retained 3 per cent. on the whole amount collected. What amount did he collect?

18. If the premium on gold is $15\frac{3}{4}$ per cent., what amount of gold must one sell to pay a note of \$150 in currency?

7.

Thirty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$16,875.68. February 1 he pays out \$3,392.75, on which he is entitled to a commission of $1\frac{3}{4}$ per cent. March 1, he receives \$3,750.87. May 1, he pays out \$2,997.50, on which he is entitled to a commission of $2\frac{1}{2}$ per cent.

Make a statement of his account in the frame on the opposite page, showing balance due the United States.

[illegible]

8.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when this paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Who commanded the American, and who the British force, at Yorktown in 1781?

21. Who commanded the American, and who the British army, at New Orleans, January 8, 1815?

22. When, and where, did General Lee surrender?

23. Name the first six Presidents of the United States.

24. Who administers the oath to the President on entering upon the duties of his office?

25. What form of government is that of the United States? England? Russia?

26. To what branch of the Government does the Constitution give the right to declare war against a foreign nation?

27. What are the geographical divisions of America ?

28. Where is Delaware Bay?

29. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

Twenty-five minutes will be allowed for the completion of this paper; at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

30. Copy the following, and correct the orthography and punctuation:

These accounts comprize staitments and vouchers not only of all goods enterd at anny porte and actualy placed in bondid wairhouses but allso of all goods enterd at such porte for amediate exporttation to forrin countreys such goods bein considerd as constructivly warehoused, in these accounts are abstracs of all goods withdrawn, from

warehouse for consumption transportashun to otther portes or exportation, to forrin countrys, They containe allso statements of salt; withdrawn from warehouse purseuent to the provishuns of the fourth section act July 28, 1866 to be taken on board vesels lisensed for the fisherys under bond to be used in curing fish, seperate acounts are rendered of all transportation exportation and salt-bonds taken to cover such withdrawel.

10.

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

31. Correct the following sentences :

In him were happily blended true dignity with softness of manners.

The soldiers marched slow.

He bought his watch at Ball's and Black's, New York.

Everybody trembled for themselves or their friends.

Various places was found in the sand where the ostriches had lain their eggs.

Some men are like so many puppets who are moved by wires.

John the Baptist came neither eating bread or drinking wine.

What is the student who I gave the book to, and whom, I am persuaded, deserves it ?

11.

One hour and thirty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

32. Answer the following letter and fold and brief your reply :

WASHINGTON, June 1, 1872.

Hon. W. T. HAINES,

Commissioner of Customs.

SIR: I have the honor to request that you will furnish me with full answers to the following inquiries, for the information of one of my constituents :

1. How are commissioned officers of the customs appointed ?
2. How are subordinate officers of the customs appointed ?
3. What is the fundamental customs act of Congress ?
4. Explain the meaning of the words *ad valorem* and specific as used in the tariff.
5. What is the Treasury rule for the calculation of salaries, fixed by the year, for shorter periods than one year ?
6. How are funds for disbursement obtained from the Treasury by customs disbursing agents ?
7. What kind of money is receivable for duties ?
8. From what are the emoluments of customs officers derived ?
9. What is necessary, in all cases, before a custom appointee can enter on the duties of his office and receive pay ?

Very respectfully,

JOHN SMITH, M. C.

EXAMINATION No. 4.—ADMISSION.

TREASURY DEPARTMENT, June 10, 1872.

1.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately after the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth ?
5. State briefly as to elementary education.
6. What subsequent experience in business or profession ?

2.

7. What clerical experience?

Ten minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck when the paper will be taken up by the examiner.

If completed in less than the prescribed time the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write in figures the following numbers:

Two thousand and three.

Seven hundred and fifty thousand two hundred and four.

Two hundred and five, and decimal three-thousandths.

9. Write at length the numbers expressed by the following figures:

210,073.

50,210,103.

2,103.

40,001.3201.

3.

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

10. Add the following columns of figures and give each answer under the column to which it pertains:

37,640,787.95	37,640,787.95
109,741,134.10	109,741,134.10
209,464,215.25	209,464,245.25
309,222,813.42	309,256,813.42
266,028,537.44	266,027,537.43
191,087,589.41	191,087,589.41
158,356,460.86	158,356,460.86
311,533.83	311,533.83
311,533.83	194,572.32
24,909.46	24,709.46
119,248.30	118,248.30
92,718.50	92,718.50
150,476.14	150,476.14
103,880.82	103,880.82
149,004.15	140,004.15
175,111.81	175,111.81
	193,636.59
	269,803.41
	315,022.36
	205,217.87
	379,558.23
	384,720.19
	445,845.19
	464,546.52
	417,124.98
	337,032.62
	315,783.47
	457,919.66
	509,113.37

4.

One hour will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Express the answers decimally, and show the operation at length in each case.

11. A quartermaster purchased 17 tons of hay, at \$10.50 per ton; 2,570 pounds of corn, at $87\frac{1}{2}$ cents per bushel, (56 pounds to the bushel;) 1,956 pounds of oats, at $37\frac{1}{2}$ cents per bushel, (32 pounds to the bushel;) and 10,247 feet of lumber, at \$15.62 $\frac{1}{2}$ per thousand feet. What was the total cost of the purchase?

12. A disbursing agent receives \$11,948.23. He pays out \$3,096.48, and the residue he disburses to five sub-agents as follows: The first receives a fourth part, and the remainder is divided equally among the others. What was the share of each? (Give the answers to the third decimal place.)

5.

16. A commissary of subsistence about to change quarters, and being compelled to dispose of $113\frac{3}{4}$ bushels of wheat, sold $\frac{5}{8}$ of the same at $\$2\frac{1}{4}$ a bushel, and the remainder at $\$1\frac{3}{4}$ a bushel. How much did he receive for his wheat?

6.

19. What is the interest on \$156,000 for $8\frac{1}{2}$ months at 6 per cent. a year?

7.

Make a statement of his account in the frame on the opposite page, showing balance due the United States.

THE UNIVERSITY OF CHICAGO
LIBRARY

8.

Fifteen minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

21. What French nobleman was actively engaged in our Revolutionary war?
22. Who were General Arnold and Major André?
23. What was the cause of the war of 1812?
24. In what year did the war between United States and Mexico begin?
25. What does the writ of habeas corpus authorize an officer to do?
26. What are letters of marque and reprisal?
27. Does the Constitution prohibit Congress passing laws for the establishment of any religion?
28. What States border on the Gulf of Mexico?
29. What are the two principal mountain-ranges of the United States?
30. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

Twenty-five minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it on the examiner's desk.

The answer must be given immediately under the question.

Copy the following and correct the orthography and punctuation:

31. The influanse of the norman Conquest upon the language of englend like that of a grate Inundacion wich at first bury's the face of the landscap under its wators butt, wich at last subcideing leves behind it the elemants, of new buty and fertillity. it's first effeck was to degraide the saxan tong. to the exklucive use of the inferier ordors and by, the transferranse of estaits ecklesiastical benifices and civill dygnities to nor-man posesors to giv the french Language wich had begun too prevale at kourt from the time of edward The confessor a more compleat predomenense amonge the hier clasess of socity. the nativ gentre of england wer ether driven intoo exile or, depresd; intoo a stait of dependance on there conquerer wich habichuatid them to speke his languæg.

10.

Twenty minutes will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

32. Correct the following sentences:

He found the memoranda and took it home.

Do not they say, every true believer has the spirit of God in them?

The difference between he and I is not very great.

Had I known the character of the lecture I would not have went.

Neither riches nor fame render a man happy.

He admired Homer's works for its beauty.

He cannot get no employment in town.

Each man and each woman were particularly alluded to in the report of the affair.

One hour will be allowed for the completion of this paper, at the end of which time a bell will be struck, when the paper will be taken up by the examiner.

If completed in less than the prescribed time the candidate should note on the paper the exact time he has been engaged upon it, and place it upon the examiner's desk.

33. Write an account of your life, in the form and style of a letter, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 5.—ADMISSION.

TREASURY DEPARTMENT, *July 2, 1872.*

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth ?
4. Date of birth ?
5. State briefly as to your education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?

2.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write in figures the following numbers :

Three thousand and six.

Seventy-five thousand two hundred and four.

One hundred and three, and decimal two-thousandths.

9. Write at length the numbers expressed by following figures :

40,501.

23,201,302.

32.101.

33,001.203.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

10. Add the following columns of figures, and give the answer immediately under the column to which it pertains :

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Show the operation at length in each case.

11. The Government, in purchasing land for a park, bought 56 acres of woodland, at \$46.34½ per acre ; 176 acres of meadow-land at \$59.46½ per acre ; and 37 acres of low-land, at \$13.83¾ per acre. What was the area of the land ; what its cost ; and what the average price per acre ?

12. A quartermaster has \$8,345 on hand, and receives \$4,379.83½ from each of six sales of property ; he turns over to one quartermaster \$3,976.48, and pays \$120 for corn.

8.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

19. Where was the first permanent settlement made in the United States?
20. In what year was the battle of Bunker Hill fought?
21. Who commanded the American Army during the Mexican war?
22. For what causes may the President of the United States be removed from office?
23. What persons are eligible to the office of President?
24. State some of the powers conferred on the President by the Constitution.
25. What limitation is there to the power of the President to grant pardons?
26. Which is the largest State in the Union, and which the smallest?
27. Name the New England States.
28. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it and place it on the examiner's desk.

The answer must be given immediately under the question.

29. Copy the following and correct the orthography and punctuation:

The cairful studdy off languidge can not fale to maik the studant acquaintid with the lauz of the humen mind. the o-rigen and formashun of wurds and the struckcher of sentenses egzibbited in ettamollogee and cintacks; taken as a hole, air butt a counterpart off thoas mentle fenominay wich hav bin colleckted and clasyfide by the masters of mentle siense, The loz of suggestion of memmerry of immajenashun of abstrackshun of gennerlisation and rezoning air distinctley exzibbitid not meerly in the hire spessimens of elokwentz and poetry but allso in the common forms off languidge; so that their is trooth in the remarc "that we mite turn a treetis on the filosofy of mind intoo won on the filosofy of languidge by nearly supposing that evvery sed in the former of the thoughts as subjecktiv is sed agen in the latter of the words as subjecktiv."

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

30. Correct the following sentences:

How does this mans definitions stand affected?

Each day and each hour bring their portion of study.

Neither Virgil or Homer are deficient in grandeur of style.

Neither history nor tradition furnish such information.

They live conformable to the rules of prudence.

Whose works is these? They are Cicero the most eloquent of men's.

There is no data by which it can be estimated.

What sounds have each of the vowels?

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

31. Write an account of your life, in the form and style of a letter, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 6.—PROMOTIONS.

OFFICE AUDITOR OF TREASURY FOR THE
POST-OFFICE DEPARTMENT,
July 3, 1872.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Three thousand and six.

Seventy-five million, two hundred and four thousand, six hundred and three.

One hundred and three, and decimal two-thousandths.

10. Write at length the numbers expressed by following figures:

40,501.

23,201,302.

32.101.

33,001.203.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give the answer immediately under the column to which it pertains:

37,640,787	95
109,741,144	10
209,464,215	25
309,226,813	42

509,113	37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

13. A quartermaster has \$8,345 on hand, and receives \$4,379.83 $\frac{1}{2}$ from each of six sales of property; he turns over to one quartermaster \$3,976.48, and pays \$2,108.68 for corn. Upon being relieved from duty, he turns over to one quartermaster one-third of the residue, and divides the remainder equally among three others. What was the share of each?

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

14. The cost price of beef is $11\frac{3}{8}$ cents per pound, and flour $3\frac{1}{2}$ cents per pound. One pound and four ounces of beef and one pound and six ounces of flour are allowed to a ration. How much will 1,876 rations cost at the above rates?

16. What amount of salary is due a postmaster, whose annual compensation is \$1,100, from July 3 to August 5, 1871?

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

17. Five persons, having claims against the Government, placed their claims in the hands of an agent for collection. A's claim amounted to \$500, B's to \$425, C's to \$300, D's to \$250, and E's to \$175; but, after the agent had deducted his fees, there was but \$1,155 left. How much did each claimant receive?

7.

The above are the money-order transactions of John Jones, postmaster at Jonesville, Indiana, for the quarter ended June 30, 1871, for which he is allowed a commission of one-third of the fees collected, and one-fourth of one per cent. of the amount of *orders paid*. Make statement showing balance due the United States in the frame beneath.

[illegible]

8.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Where was the first permanent settlement made in the United States?
21. In what year was the battle of Bunker Hill fought?
22. Who commanded the American Army during the Mexican war?
23. For what causes may the President of the United States be removed from office?
24. What persons are eligible to the office of President?
25. State some of the powers conferred on the President by the Constitution.
26. What limitation is there to the power of the President to grant pardons?
27. Which is the largest State in the Union, and which the smallest?
28. Name the New England States.
29. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

30. Copy the following and correct the orthography and punctuation:

The cairful studdy off languidge can not fale to maik the studant acquaintid with the lauz of the humen mind. the orrigin and formashun of wurds and the struckcher of sentences egzibbited in ettamollogee and cintacks; taken as a hole, air butt a counterpart of off thoas mentle fenominay wich hav bin colleckted and clasyfide by the masters of mentle siense. The los of suggestion of memmerry of immajenashun of abstrackshun of gennerlisation and rezoning air distinctly exzibbitid not meerly in the hire spessimens of elokwentz and poetry butt allso in the common forms off languidge; so that their is trooth in the remarc "that we mite turn a treetis on the filosofy of mind intoo won on the filosofy of languidge by mearly supposing that evvery sed in the former of the thoughts as subjectiv is sed agen in the latter of the words as objectiv."

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

31. Correct the following sentences:

How does this mans definitions stand affected?

Each day and each hour bring their portion of study.

Neither Virgil or Homer are deficient in grandeur of style.

Neither history nor tradition furnish such information.

They live conformable to the rules of prudence.

Whose works is these? They are Cicero the most eloquent of men's.

There is no data by which it can be estimated.

What sounds have each of the vowels?

11.

32. Answer the following letter, and fold and brief your reply:

TREASURY DEPARTMENT, *Washington, June 1, 1872.*

Hon. J. J. MARTIN, *Auditor of Treasury for Post-Office Department:*

SIR: I have the honor to request that you will furnish me with the following information, which I desire to use in my forthcoming report:

1. What duties are assigned by law to the Auditor of the Treasury for the Post-Office Department?
2. Are the settlements and decisions of the Auditor final; if not, to what officer does an appeal lie?
3. Into what Divisions is that Bureau divided?
4. State briefly the work assigned to each Division.
5. How are contractors credited on the ledger account with their quarterly transportation?
6. How are errors and omissions in the settlement of a quarterly account-current corrected after signature?
7. Explain the difference between an Auditor's draft and a Postmaster-General's draft.

Very respectfully,

GEO. S. BOUTWELL,
Secretary.

EXAMINATION No. 7.—PROMOTION.

BUREAU OF STATISTICS,
July 6, 1872.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education?
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the nature of the duties you perform.

2.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Twenty thousand and six.

One hundred and twenty-three thousand two hundred and one.

Ten thousand, and decimal two-hundredths.

10. Write at length the numbers expressed by following figures:

400,205.

13,405,200.

133.4001.

44,206.301.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give the answer immediately under the column to which it pertains:

37,640,787	95
109,741,134	10
209,464,215	25

464,546	52
427,124	98
337,032	62
315,783	47
457,919	66
509,113	37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The cost price of beef is $11\frac{1}{2}$ cents per pound, and of flour $3\frac{3}{4}$ cents per pound. One pound and four ounces of beef and one pound and six ounces of flour are allowed to a ration. How much will 413 rations cost at the above rates?

13. If the premium on gold is $14\frac{7}{8}$ per cent., what amount of gold must I sell to pay a note of \$763 currency?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. A clerk in the Treasury Department was appointed January 1, 1870, at a salary of \$1,200 a year; was promoted June 15 to \$1,400; and September 20 to \$1,600. How much salary was he paid for the year ending December 31, 1870?

15. What is the amount of duty chargeable on 2,372 $\frac{1}{4}$ pounds of wool, valued at \$581.64, when the rate of duty is 10 cents per pound and 11 per cent. *ad valorem*?

16. In a county embracing a population of 97,213 persons, a tax is levied for town, county, and State purposes, amounting to \$100,406. Of this sum, a part is to be raised by a tax of 20 cents on each poll, (or person,) and the remainder by a tax of two mills on the dollar. What was the amount of property on the tax-list?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. Five persons, having claims against the Government, placed their claims in the hands of an agent for collection. A's claim amounted to \$321, B's to \$302, C's to \$284, D's to \$203, and E's to \$171; but after the agent had deducted his fees, there was but \$1,025 left. How much did each claimant receive?

18. From a kilogram (1,000 grams) of pure gold may be coined 279 of the newly-established standard 10-mark pieces of Germany. The standard gold dollar of the United States contains, of pure gold, $23\frac{23}{100}$ troy grains. A gram is equivalent to 15.432349 troy grains. What is the intrinsic value of the German mark (the new unit of account for the German empire) expressed in terms of the United States gold dollar and its decimal subdivisions?

7.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$10,271.63. February 1, he pays out \$3,220.34, on which he is entitled to a commission of $1\frac{1}{2}$ per cent. March 1, he receives \$2,604.72. May 1, he pays out \$3,423.02, on which he is entitled to a commission of $2\frac{1}{2}$ per cent.

Make a statement of his account in the frame beneath, showing balance due the United States.

--	--	--	--	--	--	--	--

8.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Who was President of the United States during the Mexican war?

21. What nation assisted the Americans during the Revolutionary war?

22. What were the causes leading to the Mexican war?

23. What were the causes of the late rebellion?

24. How many justices of the Supreme Court are there, and who is the Chief Justice?

25. What body tries the President in case of impeachment?

26. Whom does the Constitution authorize to declare war?

27. What chain of lakes forms part of the northern boundary of the United States?

28. What States border on the Pacific Ocean?

29. What States border on Lake Erie?

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

30. Copy the following and correct the orthography and punctuation:

Amunition and artilery were yet wanting. though great exertions had bin maid to obtane military stores butt. this want was, partially suplied; by an enterprize of the grean mountin boy's as the inhabitants of the country whitc is now. The state of vermont: were then caled it was knoun that the fortresess of tyconderoga and, krown point had but slender garisons and were imperfectly. gaurded Ethan allen and seth warner who comanded, sum armed voluntear's in that region undertook, upon their own responcibility to take these fourts by supprize; and they suceded 200 peices of artilery and a conciderable suply of powder were thus obtained; for the camp near Boston the british army at that plaic had bin reinforced: and now amounted to 10.000 men, under generals Howe clinton and burgoyne.

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

31. Correct the following sentences:

He is the strongest of the two but not the wisest.

A mans manner's frequently influence his fortune.

And let none of you imagine evil in your hearts against his neighbor.

Everybody trembled for themselves or their friends.

What signifies good opinions unless they are attended by good conduct?

They live conformable to the rules of prudence.

He cannot be above six foot, two inches high.

Neither poverty or riches are injurious to him.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

32. Write a letter to the Secretary of the Treasury, of not less than a page and a half in length, explaining in general terms the duties of the Bureau of Statistics, and specifying, in detail, the duties of the division in which you are employed.

EXAMINATION No. 8.—PROMOTION.

OFFICE SUPERVISING ARCHITECT, *July 6, 1872.*

Of this sum, a part is to be raised by a tax of 20 cents on each poll, (or person,) and the remainder by a tax of two mills on the dollar. What was the amount of property on the tax-list?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. Five persons, having claims against the Government, placed their claims in the hands of an agent for collection. A's claim amounted to \$321, B's to \$302, C's to \$284, D's to \$203, and E's to \$171; but, after the agent had deducted his fees, there was but \$1,025 left. How much did each claimant receive?

18. From a kilogram (1,000 grams) of pure gold may be coined 279 of the newly-established standard 10-mark pieces of Germany. The standard gold dollar of the United States contains, of pure gold, $23\frac{2}{100}$ troy grains. A gram is equivalent to 15.432349 troy grains. What is the intrinsic value of the German mark (the new unit of account for the German empire) expressed in terms of the United States gold dollar and its decimal subdivisions?

7.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$10,271.63. February 1, he pays out \$3,220.34, on which he is entitled to a commission of $1\frac{1}{4}$ per cent. March 1, he receives \$2,604.72. May 1, he pays out \$3,423.02, on which he is entitled to a commission of $2\frac{1}{4}$ per cent.

Make a statement of his account in the frame beneath, showing balance due United States.

[illegible]

8.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Who was President of the United States during the Mexican war?
21. What nation assisted the Americans during the Revolutionary war?
22. What were the causes leading to the Mexican war?
23. What were the causes of the late rebellion?
24. How many Justices of the Supreme Court are there, and who is the Chief Justice?
25. What body tries the President in case of impeachment?
26. Whom does the Constitution authorize to declare war?
27. What chain of lakes forms part of the northern boundary of the United States?
28. What States border on the Pacific Ocean?
29. What States border on Lake Erie?

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain

31. Correct the following sentences:

He is the strongest of the two but not the wisest.

A man's manner's frequently influence his fortune.

And let none of you imagine evil in your hearts against his neighbor.

Everybody trembled for themselves or their friends.

What signifies good opinions unless they are attended by good character?

They live conformable to the rules of prudence.

He cannot be above six foot, two inches high.

Neither poverty or riches are injurious to him.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

32. Answer the following letter, and fold and brief your reply.

WASHINGTON, D. C., July 6, 1872.

A. B. MULLETT, Esq.,

Supervising Architect, Treasury Department:

SIR: Will you be kind enough to answer the following questions pertaining to your office:

1. What is the proper course for disbursing agents for the construction or repairs of public buildings to pursue to obtain funds for the prosecution of the work.
2. How often are disbursing agents required to render their accounts of disbursements?
3. How long a time, under the "Regulations," is given disbursing agents in which to render their accounts of disbursements?
4. What constitute the monthly cash papers of a disbursing agent for the construction or repairs of a public building?
5. What should the account-current exhibit?
6. What should the abstract of disbursements exhibit?
7. What should a voucher for the purchase of material required for the construction or repair of a public building exhibit?
8. How should expenditures for personal services be exhibited?
9. Through what course does an account of a disbursing agent for the construction or repairs of a public building pass, from its rendition to its final settlement?

Respectfully, yours,

THOMAS JONES.

EXAMINATION No. 9.—PROMOTION.

LIGHT-HOUSE BOARD, July 6, 1872.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State, briefly, as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the nature of the duties you perform.

2.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write, in figures, the following numbers:

Twenty thousand and six.

One hundred and twenty-three thousand two hundred and one.

Ten thousand, and decimal two-hundredths.

10. Write at length the numbers expressed by the following figures:

400, 205

13, 405, 200

133. 4001

44, 206. 301

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give the answer immediately under the column to which it pertains:

37, 640, 787 95
 109, 741, 134 10
 209, 464, 215 25
 309, 226, 813 42
 266, 027, 537 43
 191, 087, 589 41
 158, 356, 460 86
 311, 533 83
 194, 572 32
 24, 709 46
 118, 248 30
 92, 718 50
 150, 476 14
 103, 880 82
 149, 004 15

37, 640, 787 05
 109, 731, 134 10
 209, 464, 215 25
 309, 226, 813 42
 266, 027, 537 43
 191, 087, 589 41
 158, 356, 460 86
 311, 533 83
 194, 572 32
 24, 709 46
 118, 248 30
 92, 718 50
 150, 476 14
 103, 880 82
 149, 004 15
 175, 111 81
 193, 636 59
 269, 803 41
 315, 022 36
 205, 217 87
 379, 559 23
 384, 720 19
 445, 485 18
 464, 546 52
 427, 124 98
 337, 032 62
 315, 783 47
 457, 919 66
 509, 113 37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The cost price of beef is $11\frac{1}{2}$ cents per pound, and of flour $3\frac{2}{3}$ cents per pound.

One pound and four ounces of beef and one pound and six ounces of flour are allowed to a ration. How much will 413 rations cost at the above rates?

13. If the premium on gold is $14\frac{7}{8}$ per cent., what amount of gold must I sell to pay a note of \$763 in currency?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. A clerk in the Treasury Department was appointed January 1, 1870, at a salary of \$1,200 a year; was promoted June 15 to \$1,400; and September 20 to \$1,600. How much salary was he paid for the year ending December 31, 1870?

15. What is the amount of duty chargeable on 2,372½ pounds of wool, valued at \$581.64, when the rate of duty is 10 cents per pound and 11 per cent. *ad valorem*?

16. In a county embracing a population of 97,213 persons, a tax is levied for town, county, and State purposes, amounting to \$100,406. Of this sum a part is to be raised by a tax of 20 cents on each poll, (or person,) and the remainder by a tax of two mills on the dollar. What was the amount of property on the tax-list?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. Five persons, having claims against the Government, placed their claims in the hands of an agent for collection. A's claim amounted to \$321, B's to \$302, C's to \$284, D's to \$203, and E's to \$171; but, after the agent had deducted his fees, there was but \$1,025 left. How much did each claimant receive?

18. From a kilogram (1,000 grams) of pure gold may be coined 279 of the newly-established standard 10-mark pieces of Germany. The standard gold dollar of the United States contains, of pure gold, $23\frac{23}{100}$ troy grains. A gram is equivalent to 15.432349 troy grains. What is the intrinsic value of the German mark (the new unit of account for the German empire) expressed in terms of the United States gold dollar and its decimal subdivisions?

7.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$10,271.63. February 1 he pays out \$3,220.34, on which he is entitled to a commission of $1\frac{1}{2}$ per cent. March 1, he receives \$2,604.72. May 1, he pays out \$3,423.02, on which he is entitled to a commission of $2\frac{1}{2}$ per cent.

Make a statement of his account in the frame beneath, showing balance due the United States.

[illegible]

8.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Who was President of the United States during the Mexican war?
21. What nation assisted the Americans during the Revolutionary war?
22. What were the causes leading to the Mexican war?
23. What were the causes of the late rebellion?
24. How many justices of the Supreme Court are there, and who is the Chief Justice?
25. What body tries the President in case of impeachment?
26. Whom does the Constitution authorize to declare war?
27. What chain of lakes forms part of the northern boundary of the United States?
28. What States border on the Pacific Ocean?
29. What States border on Lake Erie?

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

30. Copy the following, and correct the orthography and punctuation:

Amunition and artilery were yet wanting. though grate exertions had bin maid to obtane millitary stores butt. this want was, partialy suplied; by an enterprize of the grean mountin boy's as the inhabitants of the country witch is now. The state of vermount: were then caled it was knoun that the fortresses of tyconderoga and krown point had but slender garisons and were imperfectly. guarded Ethan allen and seth warner who comanded, sum armed voluntear's in that region undertook, upon their own responcibility to take these fourts by supprize: and they suceeded 200 peices of artilery and a considerable suply of powder were thus obtained; for the camp neer Boston the british army at that plaic had bin reinforced: and now amounted to 10.000 men, under generals Howe clinton and burgoyne.

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

31. Correct the following sentences:

He is the strongest of the two but not the wisest.

A mans manner's frequently influence his fortune.

And let none of you imagine evil in your hearts against his neighbor.

Everybody trembled for themselves or their friends.

What signifies good opinions unless they are attended by good conduct?

They live conformable to the rules of prudence.

He cannot be above six foot, two inches high.

Neither poverty or riches are injurious to him.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

32. Answer the following inquiries, in the form and style of a letter to the Board of Examiners, and fold and brief your reply:

1. What are some of the characteristics by which mariners can distinguish our lights from each other?

2. When a voucher for payment of purchase-money for a light-house site is presented, what course is to be taken before passing it?

3. An inspector, on being relieved, turned over the balances of appropriations in his hands to his successor. Is his course proper?

4. If not, what should he have done?

5. How can the mistake be rectified, the outgoing inspector being out of reach when it is discovered?

6. Describe the process of warrant and counterwarrant.

7. When the voucher of a contractor appears in an account, what course is to be taken before passing it?

8. What course should be taken to ascertain that the amounts charged on pay-rolls for monthly salaries have been duly authorized?

9. What course should be taken before passing a voucher for the pay of a light-house keeper?

Yours, respectfully,

GEORGE ROBINSON, M. C.

EXAMINATION No. 10.—PROMOTION.

SECOND AUDITOR'S OFFICE, *July 8, 1872.*

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Twenty-three thousand and six.

Two hundred and three thousand one hundred and two.

Twenty millions and one, and decimal twenty-one thousandths.

10. Write at length the numbers expressed by following figures:

253,201.

1,204,301,221.

250,000.21.

26,204.3051.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures and give the answer immediately under the column to which it pertains:

37,640,787.95	37,640,787.95
109,741,134.10	109,741,134.10
209,464,215.25	209,464,215.25

19. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$11,243 84. February 1, he pays out \$3,118 93, on which he is entitled to a commission of 1½ per cent. March 1, he receives \$3,750 87. May 1, he pays out \$3,423.02, on which he is entitled to a commission of 2½ per cent.

Make a statement of his account in the frame beneath, showing balance due the United States.

--	--	--	--	--	--	--	--	--	--

8.

Upon completing the answer to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Who was President of the United States during the war of 1812?
21. Who was the reputed author of the Declaration of Independence?
22. Who were Patrick Henry and Benjamin Franklin?
23. Where was the first great battle of the late rebellion fought?
24. Is the Vice-President authorized to act as President during the temporary absence of the President?
25. Is the Vice-President ever entitled to a vote in the Senate; if so, when?
26. Is a person of foreign birth eligible to the office of President or Vice-President?
27. What river forms part of the boundary between the United States and Mexico?
28. Name the New England States.
29. Through what States would you pass, in a journey by railroad, by the most direct line, from Washington to New York City?
30. Where are the Green Mountains?

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

31. Copy the following and correct the orthography and punctuation:

Again as they aproached the redout the murderos fire of the americans many of whom were practised marksmen burst fourth and again the asailants were driven back to the landing place they Formed and advansed a 3d third time and as the amunition of the Americans was now neerly spent they succeded in geting posession of the Hill But there oponents retired in a boddy and were not persued though they sufered much frum the fire of the shiping in their retreat The vicktory of Howe might well be considered a defeet for he lost over a thowsand men in killed and wounded while the amerckan loss was knot half as great but general warren was amoung the slain the batle was as characteristic as that of Lexington a kernel comanded and three generals either searved under him or acted independantly in directing the troops.

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

32. Correct the following sentences:

Who do you think me to be?

James is sixteen year old, but Thomas is only twelve year.

Hence naturally arise indifference or aversion between the parties.
 Every one in the family should know their duty.
 There seems to be no other words required.
 All debts are cleared between you and I.
 He came agreeable to his promise, and conducted himself suitable to the occasion.
 Neither John or Thomas were at home.

11.

33. Answer the following letter, and fold and brief your reply :

TREASURY DEPARTMENT,
 Washington, July 8, 1872.

Hon. E. B. FRENCH.

Second Auditor of the Treasury :

SIR: I have the honor to request that you will furnish me with the following information, which I desire to use in my forthcoming report :

1. What duties are assigned by law to the Second Auditor of the Treasury ?
 2. Into what Divisions is his Bureau divided ?
 3. State briefly the work assigned to each Division.
 4. In what cases is the mother entitled to bounty and arrears of pay in preference to the father ?
 5. What is the first duty of an examiner upon receiving a claim for examination ?
 6. Give a general statement of the mode of stating a paymaster's account.
 7. What is the difference between personal items and items belonging to appropriation accounts ?
 8. Through what bureaus of the War Department are property returns received ?
 9. State the method of examining these returns.
- Very respectfully,

GEO. S. BOUTWELL, *Secretary.*

EXAMINATION No. 11—PROMOTIONS.

OFFICE OF THE SECRETARY OF THE TREASURY,
 July 9, 1872.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth ;
5. State briefly as to your education.

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The Government, in purchasing land for a park, bought 93 acres of woodland, at \$46.34½ per acre; 176 acres of meadow-land, at \$59.46½ per acre; and 46 acres of low-land, at \$13.83¾ per acre. What was the area of the land; what its cost; and what the average price per acre?

13. A person was appointed to a clerkship of class one April 2, 1871; he was promoted to a clerkship of class two July 6, 1871, and to a clerkship of class three October 3, 1871. What salary did he receive to December 31, 1871, inclusive?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. The cost price of beef is 11½ cents per pound, and flour 3½ cents per pound. One pound and four ounces of beef and one pound and six ounces of flour are allowed to a ration. How much will 714 rations cost at the above rates?

15. There are five bidders to supply the Department with 800 tons Lehigh, 500 tons Cumberland, and 700 tons Baltimore coal. A offers Lehigh at \$6.29, Cumberland at \$4.38, and Baltimore at \$7.23. B offers Lehigh at \$6.80, Cumberland at \$4.12, and Baltimore at \$7.24. C offers Lehigh at \$6.17, Cumberland at \$4.19, and Baltimore at \$7.20. D offers Lehigh at \$6.40, Cumberland at \$4.35, and Baltimore at \$7.18. E offers Lehigh at \$6.50, Cumberland at \$4.33, and Baltimore at \$7.25. Which is the lowest bidder for the whole amount, and how much does each man's bid amount to?

16. What is the amount of duty chargeable on 2,913½ pounds of wool, valued at \$625.75, when the rate of duty is 10 cents per pound and 11 per cent. *ad valorem*?

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

17. In a county embracing a population of 98,415 persons, a tax is levied for town, county, and State purposes, amounting to \$123,418. Of this sum, a part is to be raised by a tax of 32 cents on each poll, (or person,) and the remainder by a tax of two mills on the dollar. What was the amount of property on the tax-list?

18. Five persons, having claims against the Government, placed their claims in the hands of an agent for collection. A's claim amounted to \$625, B's to \$425, C's to \$275, D's to \$250, and E's to \$175; but after the agent had deducted his fees there was but \$1,025 left. How much did each claimant receive?

7.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

20. John Smith is a disbursing agent of the United States. January 1, 1872, there is in his hands \$11,870.63. February 1, he pays out \$3,220.34, on which he is entitled to a commission of $1\frac{3}{4}$ per cent. March 1, he receives \$3,750.87. May 1, he pays out \$4,763.82, on which he is entitled to a commission of $2\frac{1}{2}$ per cent.

[illegible]

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

21. Who was President of the United States during the war of 1812?
22. Who was the reputed author of the Declaration of Independence?
23. Who were Patrick Henry and Benjamin Franklin?
24. Where was the first great battle of the late rebellion fought?
25. Is the Vice-President authorized to act as President during the temporary absence of the President?
26. Is the Vice-President ever entitled to a vote in the Senate; if so, when?
27. Is a person of foreign birth eligible to the office of President or Vice-President?
28. What river forms part of the boundary between the United States and Mexico?
29. Through what States would you pass, in a journey by railroad, by the most direct route, from Washington to New York City?
30. Where are the Green Mountains?

9.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

31. Copy the following and correct the orthography and punctuation :

Again as they aproached the redout the murderos fire of the americans many of whom were practised marksmen burst fourth and again the asailants were driven back to the landing place they Formed and advansed a 3d time and as the amunition of the Americans was now neerly spent they succeded in geting posession of the Hill But their oponents retieed in a boddy and were not persued though they sufered much frum the fire of the shiping in their retreat The vicktory of Howe might well be conidered a defeet for he lost over a thowsand men in killed and wounded while the amerckan loss was knot half as great but general warren was amoung the slain the batle was as car-acteristic as that of Lexington a kernel comanded and three generals either searved under him or acted independantly in directing the troops.

10.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

32. Correct the following sentences :

Who do you think me to be ?

James is sixteen year old, but Thomas is only twelve year.

Hence naturally arise indifference or aversion between the parties.

Every one in the family should know their duty.

There seems to be no other words required.

All debts are cleared between you and I.

He came agreeable to his promise, and conducted himself suitable to the occasion.

Neither John or Thomas were at home.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

33. Answer the following letter, and fold and brief your reply :

WASHINGTON, D. C., July 1, 1872.

Hon. GEO. S. BOUTWELL, *Secretary of the Treasury* :

SIR : I have the honor to request that you will furnish me with an answer to the following questions for use in the preparation of a report to be made to Congress at the ensuing session :

1. What is the difference between a repayment of money into the Treasury and a deposit of revenues ? Explain the process by which each is brought upon the books.

2. Who signs the commissions of persons appointed by the President by and with the advice and consent of the Senate ?

3. What is the difference between *ad valorem* and specific duties ? Are both kinds ever levied on the same articles at the same time ?

4. How are appropriations made by Congress rendered available upon the books of the Treasury, and how are they drawn therefrom in settlement of accounts against the Government ?

5. Do the laws of the United States discriminate for or against foreign vessels in the coastwise carrying trade, and how, and in what respect ?

6. By what process does the coin made at the mint of the United States find its way into the general account of the Treasnrer of the United States ?

7. How are officers of the Revenue Marine Service appointed ; for what period of time ; how removed ; and what is their status in time of war ?

8. Does an appeal lie to the Secretary of the Treasury, from the decision of the First Comptroller, in a question of account ?

9. How are the proceeds of Government property disposed of, and can it be again used for the purchase of other property without being appropriated by Congress ?

Very respectfully,

JOHN DOE, M. C.,
126th Dist., New York.

DEPUTY COMPTROLLER OF THE CURRENCY,
August 2, 1872.

1.

2.

Bills payable, \$4,528,191.12; specie, \$13,252,998.17; premiums paid, \$5,500,890.17; dividends unpaid, \$4,540,194.61; notes and bills re-discounted, \$3,964,552.57; three per cent. certificates, \$27,502,069.81; loans and discounts, \$831,552,210.00; undivided profits, \$42,008,714.38; current expenses, \$6,153,370.29; capital stock, \$458,255,696.00; individual deposits, \$600,868,486.55; real estate, furniture, and fixtures, \$30,089,783.85; legal tenders and fractional currency, \$109,083,150.98; surplus fund, \$101,112,671.91; United States deposits, \$20,511,935.98; United States bonds to secure circulation, \$364,475,800.00; due to national banks, \$131,730,713.04; due from redeeming agents, \$83,878,608.84; United States bonds to secure deposits, \$28,087,500.00; checks and other cash items, \$14,058,268.86; United States bonds and securities on hand, \$17,753,650.00; due to State banks and bankers, \$40,211,971.67; stocks, bonds, and mortgages on hand, \$24,517,059.35; due from national banks, \$43,525,362.05; national bank notes outstanding, \$315,519,117.00; exchanges for clearing-house, \$101,165,854.52; deposits of United States disbursing officers, \$5,393,598.89; bills of national banks, \$14,197,653.00; State-bank notes outstanding, \$1,921,056.00; and due from State banks and bankers, \$12,772,669.83.

[illegible]

3.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

9. How much gold, at $114\frac{1}{8}$, must be sold to purchase \$213,350 in registered 5-20 bonds of 1862, at $115\frac{5}{8}$?

10. The legal-tender circulation of the United States is \$356,000,000. What is the amount of its depreciation relatively to gold, when gold is at a premium of $14\frac{1}{8}$?

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

11. \$4,483.43 $\frac{3}{10}$ is the simple interest on \$143,215.25, at 7 per cent. per annum, for what time, reckoning 360 days to the year?

12. The population of the United States is about 38,500,000—of the Eastern States about 3,500,000; of the Middle States, about 8,900,000; of the Southern States, including the District of Columbia, about 9,100,000; and of the Western States and Territories, about 17,000,000. The amount of national currency authorized by law is \$354,000,000. If the apportionment should be made on the basis of population alone, to how much national-bank circulation would each section be entitled?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

13. A bank offers to discount a note of \$101,515.62 $\frac{1}{2}$, payable three months after date, for either six per cent., bank discount, or six and one-sixteenth per cent., true discount. Which is the better offer, and how much would be saved by accepting it in preference to the other?

14. The following is a quarterly report of the resources and liabilities of a national bank in Albany, New York. Compute the lawful money reserve which it should have on hand, and state whether its reserve is more or less than the lawful amount, and give the amount of the excess or deficiency.

Resources.		Liabilities.	
Loans and discounts	\$522,024 91	Capital stock	\$200,000 00
Overdrafts	6,015 20	Surplus fund	100,000 00
U. S. bonds to secure circulation	198,000 00	Undivided profits	79,261 10
U. S. bonds to secure deposits	100,000 00	National-bank notes outstanding	177,500 00
U. S. bonds and securities on hand		State-bank notes outstanding	
Other stocks, bonds, and mortgages	8,400 00	Dividends unpaid	
Due from redeeming agents	246,041 98	Individual deposits	590,590 45
Due from other national banks	62,230 20	U. S. deposits	40,060 30
Due from State banks and bankers	3,461 77	Deposits of U. S. disbursing officers	1,460 02
Real estate, furniture, and fixtures	35,300 00	Due to national banks	169,716 21
Current expenses		Due to State banks and bankers	79,859 96
Premiums paid	6,986 79	Notes and bills rediscounted	
Checks and other cash items	70,971 35	Bills payable	
Exchanges for clearing-house	67,348 06		
Bills of other national banks	7,693 00		
Fractional currency	3,974 78		
Specie			
Legal-tender notes	100,000 00		
Three per cent. certificates			
Total	1,438,448 04	Total	1,438,448 04

6.

ORTHOGRAPHY, SYNTAX, AND PUNCTUATION.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

15. Copy the following, and correct the orthography, syntax, and punctuation :

Up to this pint the effecks of a paper currincy is substancialy the same wether they are convertable into speeci or not, it is wen the metals has been compleatly superceded and drove from cirkulacion that the diference between convertable and incontrovertable paper begin to be oppurative. Wen the gold or sylver have all gone from cirkulation and an equal quantity of paper have taken their place supose that a stil ferther issu is superaded the same ceries of of phenomena recommence prices raise among the rest the price of gold and sylver articles and they become an object as before to prokur coin in order to convert them into bulyon. Their is no longer eny coin in cirkulation but if the paper curincy are convertable coin may stil be obtained from the isuers in egschange for notes.

7.

History, Government, and Geography.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

HISTORY.

16. Who was the first Secretary of the Treasury of the United States ?
17. Name the Comptrollers of the Currency in the order of their incumbency.
18. When did the present suspension of specie payments take effect ?
19. What was the proceeding known as "the removal of the deposits," and in the administration of what President did it occur ?
20. What is the "Independent Treasury" system ; why is it so called, and when did it go into operation ?

GOVERNMENT.

21. Where must bills for raising the revenue of the United States originate ?
22. To whom is the power to coin money delegated and to whom denied by the Constitution ?
23. In what way only can money be drawn from the Treasury of the United States under the Constitution ?
24. What only, under the Constitution, can the States make a tender in payment of debts ?

GEOGRAPHY.

25. Name the States of the Union, giving the Eastern, the Middle, the Southern, the Western, and the Pacific States separately.

8.

BANKING, GENERALLY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

26. Mention the distinctive features of the Safety Fund Banking system, and the Free Banking system of the State of New York, and of the Suffolk Bank system of the State of Massachusetts, or, if not familiar with those systems, describe that of any State with which you are acquainted.

27. What are the principal features of the business of a bank ?

28. What are the functions of a clearing-house for banks ? Describe the mode of effecting clearances at the New York clearing-house.

9.

NATIONAL BANKING SYSTEM.

Upon completing the answers to the questions, the candidate should note on the paper

the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

29. Give the dates of the approval of the National Currency acts and principal amendments.

30. State concisely the distinctive features of the National Banking system.

31. How much national currency was first authorized; how much can now be legally issued, and on what security; and by whom and on what principle is it distributed among the several States and Territories?

32. Describe the process of organizing a National Bank.

33. How, by whom, and for what period is the Comptroller of the Currency appointed, and how and by whom can he be removed?

34. In payment of what dues and demands is National Currency receivable? Is it a legal tender in payment of debts?

35. What is the meaning of the term "lawful money reserve," and what are the requirements of law in regard to it?

36. By what is the rate of interest which a National Bank may lawfully charge on a loan, or a discount, governed?

37. What reports are National Banks required to make to the Comptroller of the Currency?

38. What are the requirements of law in regard to the surplus funds of National Banks?

39. What security does the National Banking system furnish to the holders of circulating notes of National Banks; and what, if any, to their depositors and other creditors?

40. What are the steps which the law requires should precede the appointment of a receiver of a National Bank?

41. For what violations of law is a National Bank liable to forfeit its charter?

10.

PRACTICE OF THE OFFICE.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

42. Should "premiums paid" and "expenses" be classed as liabilities or as resources? Why?

43. Describe the papers required to be executed in organizing a National Bank?

44. Describe the course which you would pursue in making an examination of the condition of a National Bank.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

45. Write a letter to the Secretary of the Treasury, of not less than a page and a half in length, expressing your views concerning the National Banking system, and pointing out what, in your opinion, are the advantages and defects of the system, and fold and brief it.

EXAMINATION No. 13.—ADMISSION.

TREASURY DEPARTMENT, *October 11, 1872.*

Preliminary.

1

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth?

4. Date of birth?

5. State briefly as to your education.

6. What subsequent experience in business or profession?

7. What clerical experience?

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write in figures the following numbers:

One thousand and ten.

Eighty-six thousand four hundred and eleven.

Three hundred and three thousand, and decimal five-thousandths.

9. Write at length the numbers expressed by following figures:

56,602.

35,407,501.

37.707.

45,404.303.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

10. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

37,640,787	95
109,751,134	10
209,464,215	25
309,226,813	42

337,032	62
315,783	47
457,919	66
509,113	37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

11. A quartermaster bought $56\frac{1}{2}$ cords of hard wood, at $6.62\frac{3}{4}$ a cord, and $37\frac{3}{8}$ cords of soft wood, at \$5.50 a cord, and issued $23\frac{1}{2}$ cords of hard, and $20\frac{3}{4}$ cords of soft wood. What was the total cost, and how much remained on hand?

12. What is the interest on \$150,580 for nine months and eleven days, at 7 per cent. a year?

5.

Upon completing the answers to the questions, the candidate should note on the paper

The answers must be given immediately under the questions to which they pertain.

19. Of what nationality were the first settlers of New York City?
20. What Presidents have been elected for two terms of office?
21. Whom does the Constitution authorize to make treaties of peace?
22. By what instrument or fundamental law was the United States governed previously to the adoption of the Constitution?
23. What two ranges of mountains are there in California?
24. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

25. Copy the following and correct the orthography and punctuation :

To a carefull and atentiv obzurver of human nacher the histery of mankind presents an interresting and instructiv but mournfull piccher, it teaches him that mann is every-where the same; but however the pickehar may be varyd by sercomstances however diferent the lite in which it is vued the leading feachers remane ever the same, In no porshun of aintient histerry air we moar struck with this important fact than in that of rome, in considering the manors of that poeple grate cair should be taken that we do not purmit the clasycal asociations of our boyhood to giv us a to faverabel oppinyon of there caracter; and agen that we du not run intoo the oposit butt less probibel eror of depresheating there reel worth, Cold indede must be the hart and dul the understanding that can contemplate unmooved the histerry of the eternal citty wich after al has dun its part toards communicating to the world civvilisation and filosofy.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

26. Correct the following sentences :

Fifty pounds of wheat contains forty pounds of flour.

There are many faults in spelling which neither analogy or pronunciation justify.

Many writers are frivolously rich in style, but wretched poor in sentiment.

They, who much is given to, will have much to answer for.

His brothers offense will not condemn him.

Nothing never effected her so much as this misconduct of her child.

When the judge dare not act, where is the losers remedy ?

None of his friends are more beloved than him.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

27. Write a letter, upon any subject with which you are familiar, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 14. —ADMISSION.

TREASURY DEPARTMENT, *October 12, 1872.*

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education?
6. What subsequent experience in business or profession?
7. What clerical experience?

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

8. Write in figures the following numbers:

Five thousand and ten.

Sixty-two thousand five hundred and ten.

One thousand and three, and decimal three ten-thousandths.

9. Write at length the numbers expressed by following figures:

500,500.

68,759,205.

83.308.

110,110.110.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

10. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

37,640,787	95
109,741,134	10
209,464,215	25

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

11. The Treasury Department bought on contract 350 reams of foolscap paper, at \$3.83 $\frac{1}{2}$ per ream, 45 $\frac{1}{2}$ reams of which were returned as unsuitable, and 275 reams of let-

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

19. To what nation did Louisiana belong previously to its cession to the United States?

20. Who was the reputed discoverer of the Mississippi River?

21. Under what circumstances may the privilege of the writ of *habeas corpus* be constitutionally suspended?

22. Can either House of Congress adjourn without the consent of the other?

23. How many States and how many Territories are there in the United States?

24. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

25. Copy the following and correct the orthography and punctuation:

John paul jones or as he was comonly called paul jones was transfered in may 1776 from the alfred to the comand of The providence a vessell mounting twelve guns and haveing on bourd seventy men in this he maid sixteen prizes in little more than thre weeks he wus allso twice chast by british men of war but escaped by strattagem and superiour sayling in 1777 while the british were takeing posesion of philadelphia and gates was spreding a nett for burgoyne paul jones was in france endeavoring through the inflewence of the american comiissioners franklin deane and lee to get the comand of a larger and beter vesell than any the americans had in the servis.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

26. Correct the following sentences:

John regards neither the master nor the pupil's advantage.

These are the men whom, you might suppose, were authors of the work.

Neither wealth or honor can secure the happiness of their votaries.

The rapidity of his movements were beyond example.

These sort of men cannot give account of their faith.

The difference between him and I is not very great.

Does that boy know who he speaks to?

He was exceeding careful not to give offense.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

31. Write a letter upon any subject with which you are familiar, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 15.—ADMISSION.

TREASURY DEPARTMENT, October 14, 1872.

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State, briefly, as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write, in figures, the following numbers:

Two thousand and eight.

Twenty-seven thousand three hundred and nine.

Two hundred thousand and three, and decimal thirty-three ten-thousandths.

9. Write at length the numbers expressed by following figures:

25,602.

16,307,902.

22,221.

28,202.0307.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

10. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

37,640,787 95	37,640,787 95
109,741,144 10	109,741,134 10
209,464,215 25	209,464,215 25

	149,004 15
	175,111 81
	193,636 59
	269,803 41
	315,022 36
	205,217 87
	379,558 23
	384,720 19
	445,485 18
	464,546 52
	427,124 98
	337,032 62
	315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

11. The Treasury Department sold for \$2,240 a lot of building materials for which it paid \$3,360. What was the percentage of loss on the cost price?

12. The quartermaster at West Point bought 10,123 bushels of oats, (32 pounds to

the bushel,) at $2\frac{1}{4}$ cents per pound; 214 tons of hay (2,000 pounds to the ton,) at $1\frac{1}{2}$ cents per pound; and 34 tons of rye straw, at $\frac{3}{4}$ of a cent per pound. What amount was paid for the whole, after deducting 15 per cent. for losses in delivery?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

13. A cord of wood is 8 feet long, 4 feet broad, and 4 feet high. What is a pile of wood 19 feet long, 11 feet 5 inches high, and 8 feet 7 inches broad worth, at \$5.62½ per cord?

14. What amount in greenbacks will it take to pay a note of \$3,750.87, payable in gold, when gold is selling at 13 $\frac{3}{8}$ cents premium on the dollar?

15. What would be the interest, at 9 per cent. per annum, on \$11,823.32 for 7 months and 13 days?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

16. The duty on Brussels carpets, wrought by the Jacquard machine, is 44 cents per square yard, and in addition thereto 35 per cent. *ad valorem*, (or upon the value.) What would be the entire amount of duty chargeable on a roll measuring 2 feet 10 inches wide, 40 yards long, and valued at \$1.50 per yard?

17. The United States engineer at New York advertised for proposals for dredging 22,340 cubic yards of earth from the harbor. How much would it cost to perform the work, at $11\frac{1}{2}$ cents per cubic foot?

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

18. A certain merchant, John Bond, borrowed of William Thompson, a fellow-merchant, on January 29, 1870, 1,638 gallons of brandy worth \$3.50 per gallon, to be repaid by brandy of similar value, but 10 per cent. to be added for such amount as was not repaid within a year. Bond made such repayments, as follows: 118 gallons on July 10, 1870; 410 gallons on November 15, 1870; 290 gallons on January 28, 1871; 310 gallons on February 13, 1871; and 285 gallons on April 25, 1871.

Make on form below a statement of the account as it stood after the last installment.

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

19. What two noted Polish generals fought for this country during the Revolutionary war?

20. Who commanded the Mexican army when the city of Mexico was taken by General Scott?

21. Can a person of foreign birth be elected President of the United States?

22. Into what three co-ordinate branches is the Government of the United States divided?

23. Where is Lake Champlain?

24. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

25. Copy the following and correct the orthography and punctuation:

Their is nothing moore certen than this that the erlier we can traice back enny won languidge the more ful compleat and consistant air its form; that the later we find it egzisting the moar compressed colloquiel and busines-like it has become, Like the treas off our forrests it grows at furst wild lugzhoorient ritch in foliage full of life and shaddow and flings abroad in its vast branches the froot of a yoothfull and viggerus nacher; transplanted to the gardin of civvillisation and traned for the purposes off commerse; it becomes reggulatied trimmed prooned; nachur indede givs it life but art prescribes the direckshun and extent of its vegetation. Allways we perceive a com-preshun a graddual loss of fine distineshuns a perrishing of forms turminashuns and conjugations in the younger stait of the languidge.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

26. Correct the following sentences:

The inquisitive and curious is generally talkative.

True rhetoric and sound logic is very near allied.

Rebecca took goodly raiment and put them on Jacob.

Neither Roman or Saxon have added anything to his categories.

The chasm was twenty foot broad.

These sort of fellows are very numerous.

Where are you going at?

Wisdoms precept's forms the good mans happiness.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

31. Write a letter, upon any subject with which you are familiar, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 16.—ADMISSION.

TREASURY DEPARTMENT, *October 15, 1872.**Preliminary.*

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write in figures the following numbers:

Ten thousand and ten.

One hundred thousand and one hundred.

One hundred thousand, and one hundred-thousandth.

9. Write at length the numbers expressed by following figures:

79,702.

65,000,001.

502.502.

1,000,001.000001.

3.

Upon completing the answers to the questions, each candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

10. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

109,741,134	10	109,741,134	10
209,464,215	25	209,464,215	25

		315,783	47
		457,919	66
		509,113	37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

19. What Vice-Presidents have served out the unexpired terms of Presidents?

20. Who discovered the Hudson River, and from whom did it take its name?

21. What age is required to render a person eligible as President of the United States?

22. Who presides over the Senate during the trial of the President on impeachment?

23. What lake forms part of the boundary between New York and Vermont?

24. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answers must be given immediately under the question.

25. Copy the following, and correct the orthography and punctuation:

In february 1631 a puritan minester arived in new england by the name of roger williams, he was as yet scarcley thurty years of aige he was a man of sum enlightened veiws but his temper was not properly disciplined he Was however an ardent friend of libberty, and a fo too everyy form of legal intollerence he was at furst passtor of a church in salem here haveing advanced the oppinion that a comonwealth is bound to Protect al denominashuns of christains rather more boldly than was acceptable to the massachusetts government and haveing alsew anounced some strainge oppinions with an overbareining spirrit he was tried for herecy and was sentenced to leave the province.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

26. Correct the following sentences:

I am stronger than him, though not as large.

Who did he receive that intelligence from?

He is the strongest of the two, but not the wisest.

A mans manner's frequently influences his fortune.

No, I little thought that it were him.

He had many virtues and was exceeding beloved.

I have received no information on the subject, neither from him nor his friend.

The surveyors chain is four rod long.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

31. Write a letter upon any subject with which you are familiar, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 17.—ADMISSION.

TREASURY DEPARTMENT, *October 16, 1872.*

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth.
5. State briefly as to your education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

8. Write in figures the following numbers :

Nine thousand and two.

Fifty-seven million nine hundred and three thousand four hundred and two.

One hundred and two, and decimal three-thousandths.

9. Write at length the numbers expressed by following figures :

50,104.

32,102,203.

23.202

44,004.0302.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

10. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

209,464,215	25	209,464,215	25

		427,124	98
		337,032	62
		315,783	47
		457,919	66
		509,113	37

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Show the operation at length in each case.

11. A quartermaster bought $22\frac{1}{4}$ tons of hay, at \$22.50 per ton ; 159 bushels of corn, at $62\frac{1}{2}$ cents per bushel ; and $187\frac{1}{2}$ bushels of oats, at $31\frac{1}{4}$ cents a bushel. He afterwards issued $10\frac{1}{4}$ tons of hay, $87\frac{1}{2}$ bushels of corn, and $105\frac{1}{2}$ bushels of oats. How much of each remained on hand, and what was the cost of the whole ?

12. The United States purchased ground from three men. To A was paid $\$20.56\frac{1}{4}$ per acre for 10 acres; to B $\$22.50$ per acre for 5 acres; and to C $\$27.62\frac{1}{4}$ per acre for 6 acres. How much was paid for the whole, and what was the average price paid per acre?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

13. What will \$56,215.62 amount to in one year, seven months, and eleven days, at 6 per cent. interest a year?

14. On a certain invoice of 34,216 pounds of pepper there are discounts for damage, as follows: 12 per cent. on 6,190 pounds, 8 per cent. on 6,438 pounds, and 5 per cent. on 9,642 pounds. After deducting the discount, what would be the duty on the remainder at 5 cents per pound?

15. A vessel of 345 tons is chartered at 2 p. m., May 12, 1862, at \$3.37½ per ton per month, and is discharged at 9 a. m., May 26, 1862. How much must be paid for the use of the vessel?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

16. What amount in gold can be bought for \$575 in greenbacks when gold is selling at a premium of $14\frac{2}{3}$ per cent.?

17. A person owning \$12,000 in U. S. 5-20 bonds wishes to convert them into bank stock. The bank stock is at a discount of $3\frac{1}{2}$ per cent., while the bonds are at a premium of $14\frac{1}{4}$ per cent. What amount of stock, at par value, can he purchase, allowing the broker's charges for the purchase to be $\frac{3}{4}$ per cent.?

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

18. A certain merchant, John Bond, borrowed of William Thompson, a fellow-merchant, on January 29, 1870, 1,641 gallons of brandy worth \$3.70 per gallon, to be repaid by brandy of similar value, but 10 per cent. to be added for such amount as was not repaid within a year. Bond made such repayments as follows: 127 gallons on July 10, 1870; 413 gallons on November 15, 1870; 291 gallons on January 28, 1871; 310 gallons on February 13, 1871; and 383 gallons on April 25, 1871. Make on form below a statement of the account as it stood after the last installment.

[illegible]

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper

the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

19. Who commanded the American fleet at the battle of Lake Erie during the war of 1812?

20. Who commanded the American, and who the British, army at the battle of Saratoga, during the Revolutionary war?

21. Which branch of Congress has the sole power of impeachment?

22. Is the Vice-President ever entitled to a vote in the Senate; and, if so, when?

23. What river forms the boundary between Vermont and New Hampshire?

24. Bound the State or Territory of which you are a resident, and give its capital and principal rivers.

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

25. Copy the following and correct the orthography and punctuation.

When Columbus arived in spain the news of His wounderful diskoveries rappidly spred far and wide over thee country and he was every whare looked upon with respect and addmirashun ferdnand and isabella then at the citty of Barcelona recieved him with the most distinguished tokens of reguard he had brought various specimans of the producktions of what was now caled the new world and thease were exhibited to the king and quean and to the court who seamed to regarde them with wonder and admiration no oners were to grate four columbus and a powerfull fleat was placed at his comand for another voyage. this was maid in the fall of 1493 during wich columbus diskovered jamaica and a fiew other islands butt now unexpectid difacultys ocured enemys thickened around him and retarded his progres.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

26. Correct the following sentences:

Who should I meet the other day but my old friend?

Great pains has been taken to reconcile the parties.

Every man will be rewarded according to their works.

Nothing less than murders, rapines, and conflagrations employ their thoughts.

Bancrofts history is a work of great merit.

Neither the servants or the master are respected.

The amputation was exceeding well performed.

He was illy adapted to his position in life.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

31. Write a letter, upon any subject with which you are familiar, of not less than one page and a half in length, and fold and brief it.

EXAMINATION No. 18.—PROMOTION.

FOURTH AUDITOR'S OFFICE, *November 25, 1872.*

1.

Preliminary.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence ?
3. Place of birth ?
4. Date of birth ?
5. State briefly as to your education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers :

Twenty thousand and one.

One million two hundred and seven thousand and three.

Two hundred thousand and three, and decimal three ten-thousandths.

10. Write at length the numbers expressed by following figures :

963,201.

37,005,401.

241.417.

304,006.3002.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

109,741,134 10	109,741,134 10
209,464,215 25	209,464,215 25
309,226,813 42	309,226,813 42
266,027,537 43	266,027,537 43
191,087,589 41	191,087,589 51
158,356,460 86	158,356,460 86
311,533 83	311,533 33
194,572 32	194,572 32
24,709 46	24,709 46
118,248 30	118,248 30
92,718 50	92,718 50
150,476 14	150,476 14
	103,880 82
	149,004 15
	175,111 81
	193,636 59
	269,803 41
	315,022 36
	205,217 87
	379,558 23
	384,720 19
	445,485 18
	464,546 52
	427,124 98
	337,032 62
	315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Show the operation at length in each case.

12. A commissary of subsistence bought 200 barrels of pork, at \$15.62½ per barrel; 237 boxes of hard bread, each weighing 25 pounds, at 6½ cents per pound; and 570 pounds of coffee, at 41½ cents per pound. How much did he pay for the whole, and how much remained on hand, after issuing ¾ of each.

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. During what war did Braddock's defeat take place?

21. What nation disputed with England the mastery of the western continent previous to the Revolutionary war?

22. With what nation of Africa did the United States maintain a naval war in 1815.

23. What punishment, if any, is inflicted in case of conviction on impeachment?

24. What branch of the Government is authorized by the Constitution to declare war?

25. Where is Lake Champlain?

26. In what State does the Mississippi River rise, and where does it empty?

27. Through what States would we pass in going from New York city to Chicago by the most direct line of railroad?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Printed books however inkorect would frum there grater legability Allways be preferred too manuskript. And thare wide sirculashun would make them at once popular, standards of orthority, in all maters of anthographie and gramaticle inflection, the konfewsion. And irregularity of there speling would; acordingly powerfully tend to increse thee unsirtenty, of orthography especialy at a period when the usage of the Lerner, even was diskordent and the langwidge. Still in proees of formashun it is no dout in these, circomstances that we are to find. The explanation of the otherwise paridoxicle fact that the speling of the english Langwidge as practised by edukated persuns in the 15th & even the latter part of the 14th Century: more neerly recembles that of the present day. Than do the printed books of the sixteeuth sentury the forren printers ignorently corrupted the spelling of thare kopy books again the orthographie of thee nashun.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct the errors in syntax:

He who committed the offense you should correct, not I who am innocent.

What avail the best sentiments if persons do not live suitably to them?

John or Thomas have went to the city.

Let's you and I go.

The measure is so exceptionable that we can by no means permit it.

A christian should always act benevolent.

He relieved neither the mans' or the womans' distress.

They have been waiting this two hours.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the Board of Examiners, and fold and brief your reply:

1. Into how many divisions is the Fourth Auditor's Office divided? Give their names, and describe the duties pertaining to each division.

2. Describe an allotment in detail.

3. What becomes of a paymaster's account after it is settled in that office?

4. What is a reconciling statement?

EXAMINATION No. 19—PROMOTION.

FIFTH AUDITOR'S OFFICE, November 25, 1872.

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience.
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Twenty thousand and one.

One million two hundred and seven thousand and three.

Two hundred thousand and three, and decimal three ten-thousandths.

10. Write at length the numbers expressed by following figures:

963,201.

37,005,401.

241.417.

304,006.3002.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

109,741,134	10
209,464,215	25
309,226,813	42
266,027,537	43

379,558	23
384,720	19
445,485	18
464,546	52
427,124	98
337,032	62
315,783	47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. A commissary of subsistence bought 200 barrels of pork, at \$15.62 $\frac{1}{2}$ per barrel; 237 boxes of hard bread, each weighing 25 pounds, at 6 $\frac{1}{2}$ cents per pound; and 570 pounds of coffee, at 41 $\frac{1}{2}$ cents per pound. How much did he pay for the whole, and how much remained on hand, after issuing $\frac{3}{4}$ of each?

Give the operation and result in common fractions.

13. A quartermaster bought 875 cavalry jackets, at \$6.625 each; 912 caps, at \$.875 each; and 1,000 pairs of trousers, at \$4.3125 a pair. He issued .875 of each. What was the total cost, and how many of each remained on hand?

Give the operation and result in decimal fractions.

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Show the operation at length in each case.

14. If a paymaster receives \$150,000 from the Treasury, and fails to account for \$225 thereof, what is the percentage of loss to the Government?

15. The United States consul at Havre, in closing his accounts for the quarter, claims a balance due to him of \$58.93. He draws a draft and negotiates it through a banker, receiving five francs on the dollar on its face. If the franc be reckoned at \$.193, for what amount, in dollars and cents, must the draft be made so that he shall receive the exact equivalent (in francs) of the amount due?

16. \$6,654.58 $\frac{1}{2}$ is the interest on \$75,000 for 15 months and 7 days, at what rate per cent., reckoning 360 days to the year?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

Show the operation at length in each case.

17. What amount in gold must be sold in order to pay a note of \$7,850.62, payable in greenbacks, when gold is selling at a premium of 13 $\frac{3}{4}$ cents on the dollar?

18. The duty on burlaps is 35 per cent. ad valorem, or, upon the value. What is the amount chargeable on a bale containing 50 webs, each being 40 yards and 16 inches long, and 27 inches wide, and valued at 30 cents per yard?

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. James Smith commenced business January 1, 1871, as agent for Henry Brown, with a cash capital of \$10,000. He bought of John Jones, for cash, 600 barrels of flour, at \$10 per barrel, and of Thomas Miller 1,800 bushels of oats, at 60 cents per bushel, for which he gave his note for three months, with interest at the rate of 6 per cent. per annum; and of John Doe, for cash, 6,000 bushels of corn, at 75 cents per bushel. He sold to George Thompson, for cash, 515 bushels of oats, at 63 cents per bushel; to James Day, February 1, 1871, 313 barrels of flour, at \$10.51 per barrel, to be paid for in five months, with interest at the rate of 7 per cent. per annum; to Henry Johnson, February 15, 1871, 500 bushels of corn, at 77 cents per bushel, to be paid for in four months, with interest at the rate of 8 per cent. per annum; and to Philip Tucker, June 30, 1871, 100 barrels of flour, at \$10.25 per barrel, cash. All of the notes were paid at maturity. Make a statement of James Smith's account with Henry Brown, on the form below, as it stood after the last transaction.

--	--	--	--	--	--	--	--

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. During what war did Braddock's defeat take place?
21. What nation disputed with England the mastery of the western continent previous to the Revolutionary war?
22. With what nation of Africa did the United States maintain a naval war in 1815?
23. What punishment, if any, is inflicted in case of conviction on impeachment?
24. What branch of the Government is authorized by the Constitution to declare war?
25. Where is Lake Champlain?
26. In what State does the Mississippi River rise, and where does it empty?
27. Through what States would we pass in going from New York City to Chicago by the most direct line of railroad?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Printed books however inkorect would frum there greater legability Allways be preferred too manuskript. And thare wide sirculashun would make them at once popular, standards of orthority, in all matters of authographie and gramaticle inflection, the konfewsion. And irregularity of there speling would; accordingly powerfully tend to increase the unsirtenty, of orthography especialy at a period when the usage of the Lerner, even was diskordent and the langwidge. Still in proces of formashun it is no dout in these, circomstanses that we are to find. The explanation of the otherwise paridoxicle fact that the speling of the english Langwide as practised by ednkated persuns in the 15th & even the latter part of the 14th Century: more neerly recembles that of the present day. Than do the printed books of the sixteenth sentury the forren printers ignorently corrupted the spelling of thare kopy and there books again the orthographie of thee nashun.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct the errors in syntax:

He who committed the offense you should correct, not I who am innocent.

What avail the best sentiments if persons do not live suitably to them?

John or Thomas have went to the city.

Let's you and I go.

The measure is so exceptionable that we can by no means permit it.

A Christian should always act benevolent.

He relieved neither the mans' or the womans' distress.

They have been waiting this two hours.

LETTER AND BRIEF.

11.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. State what accounts are rendered by collectors of internal revenue, and how rendered.

2. State what is the compensation of a collector and how it is paid, and what he is required to do before being installed in office.

3. To what periods are the regular accounts of assessors of internal revenue rendered, how are they paid and adjusted, and what items do they include?

4. What commissions are allowed to stamp-agents and to purchasers of stamps?

5. Under what circumstances are consuls allowed more salary than the sum appropriated by Congress?

6. In what parts of the world are consuls authorized to perform diplomatic functions?

7. What is exchange?

EXAMINATION No. 20.—PROMOTION.

SECOND AUDITOR'S OFFICE,
December 4, 1872.

Preliminary.

1

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth?

4. Date of birth?

5. State briefly as to your education.

6. What subsequent experience in business or profession?

7. What clerical experience?

8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Thirty-two thousand and sixty.

Four millions two thousand and six.

Six hundred and one millions, twenty-five thousand, three hundred and one, and decimal eleven hundred-thousandths.

10. Write at length the numbers expressed by following figures:

301,500.

231,607,005.

506.0025.

249,064.00001.

3

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

37,640,787 95	37,640,787 95
109,741,134 10	109,741,134 10

	427,124 98
	337,032 62
	315,783 47

4

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The standard gold dollar of the United States contains nine parts of pure gold and one part of alloy, and weighs 25.8 grains troy. How many grains of gold and alloy, respectively, are required for the coinage of 6,983 gold dollars?

13. The ordnance department sold at public auction 12,750 condemned Springfield muskets, at \$12.37½ each, the original cost of which was \$14.75 per piece; 3,075 sabers, at \$3.87½ each, which cost \$5.31½ per piece; and 100,000 rounds of cartridges for \$5,000, the original cost being \$1.25 per 100 rounds. What was the total original cost, and what was the amount realized?

Give the operation and result in common fractions.

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. The duty on spool thread of cotton, containing 100 yards to the spool, is 6 cents per dozen spools, and in addition thereto 30 per cent. ad valorem, (or upon the value.) What is the amount chargeable on 11,153 spools, valued at 3 cents a spool?

15. A transport was hired to carry 315 tons of Government stores from New York to Charleston, at the rate of \$3.3125 per ton per month. The vessel left New York at 2 o'clock August 16, 1871, and reached Charleston on the 21st of the same month at 11 o'clock a. m. How much pay was due, allowing 30 days to the month?

Give the operation and result in decimal fractions.

16. What time is required for \$25,250 to gain \$5,162.22½, at the rate of 8 per cent. interest per annum, reckoning 360 days to the year?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. A paymaster made the following payments to the regiments of a brigade, to wit, to the first regiment, \$10,000; to the second, \$9,500; and to the third, \$8,575.62. Of these amounts \$2,500, \$2,275, and \$1,850 were, respectively, suspended for informalities in the vouchers. What was the per cent. of suspensions on each payment, and on the total amount paid?

18. Calvin Hale pays \$7,350 in currency for Indian goods worth \$6,345, at gold prices. What is the premium on gold; what is gold worth in currency; and what is currency worth in gold?

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. Where was the first permanent English settlement made in the United States?

21. Name the thirteen original colonies.

22. When was the second war between this country and Great Britain declared, and for what reason?

23. Is the President authorized ever to adjourn both houses of Congress; and if so, under what circumstances?

24. How may the Constitution be amended?

25. In the following list, state which are sea-ports, and which inland cities; Albany, Charleston, (South Carolina,) Raleigh, Atlanta, Savannah, Portland, and Hartford.

26. What rivers unite and form the Ohio?

27. What are the principal tributaries of the Mississippi River?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of orthography and punctuation, but not otherwise altering either the words or their order:

the inflewence of printing upon the english landgwide has bin much extended and strengthened by to importent sircumstances comon to thee two grate countrys of which it is the virnackuler the one is that in neather does their. Exist nor for senturies has thare existed a sencership of the Press a previus orthoritative examinashun of manuskript matter intended for The Publick;—the other is that publick diskussion of all questions in the departments of relegion of intellectual and morral filosofy of Pollyticks indede; of awl topics afecting the grate and purminant interests of man; is free and unrestricted hence the populer mind the populer speach in both countries are open to a class of inflewences whitch in moste Continentle Staits are confined to the priviledged and professional alone.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct the errors in syntax:

The rapidity of his movements were beyond example.

The wall is ten foot high.

I have neither Johns or Williams' book.

Which of those two cords is the stronger?

Who did you go with?

The sight appeared terrible to me.

I can learn him many things.

He done me no harm, for I had wrote my letter before he come home.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note upon the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. How is money advanced and charged to a disbursing officer?
2. If an Indian agent should purchase goods without authority, and should fail to account for them on his property return, what would you do on auditing his accounts?
3. If on examination of an officer's returns it is found that certain articles of clothing are unaccounted for, what action is taken in the matter?
4. What are appropriation items?
5. What are the duties of the division of inquiries and replies?
6. Where two brothers have made application, in form, for the arrears of pay and bounty due a deceased brother, and a treasury certificate for the amount due has been issued to them jointly, what disposition is to be made of the share of one of the brothers who has died pending settlement?
7. Which is the debit and which the credit side of an account-current rendered by a disbursing officer?
8. In stating an officer's account, do his debit and credit in his account-current correspond with the debit and credit in the statement?
9. What are the general duties of the division for the investigation of frauds?

EXAMINATION No. 21.—PROMOTION.

THIRD AUDITOR'S OFFICE, *January 4, 1873.*

Preliminary.

1.

Upon completing the answers and questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Thirty-two thousand and seventeen.

Fifteen millions two thousand and three.

Ten millions and two, and decimal twenty-three hundred-thousandths.

10. Write at length the numbers expressed by following figures:

256,002.

912,300,016.

2,321.021.

506,301.2001.

3.

Upon completing the answers to the questions, the candidate should note on the

paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

\$103,880 82	\$509,113 37
109,741,134 10	457,919 66
209,464,215 25	109,741,134 10
309,226,813 42	209,464,215 25
266,027,537 43	309,226,213 42

	464,546 52
	427,124 98
	337,032 62
	315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. A commissary of subsistence bought 198,785 pounds of bacon, at 13.5 cents per pound ; 98,000 pounds of flour, at \$14.375 per barrel, (196 pounds to the barrel ;) 19,800 pounds of coffee, at 37.5 cents per pound ; and 497 gallons of vinegar, at 44.75 cents per gallon. What was the total cost of the purchases ?

Give the operation and result in decimal fractions.

13. A disbursing officer deposited in the Treasury \$23,914.59, having retained 1% per cent. on the amount collected. What amount did he collect ?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. If the duty on a lot of sugar weighing 1,639,728 pounds is $2\frac{3}{4}$ cents per pound, and there is a discount of $7\frac{1}{2}$ per cent. allowed for damage, what amount of duty must be paid ?

Give the operation and result in common fractions.

15. The weight of the United States gold double-eagle is 1.075 ounces troy. The intrinsic value of standard gold is $15\frac{6}{10}$ times that of an equal weight of standard silver, and the weight of a silver dollar is .859375 ounces troy. What is the intrinsic value of the silver dollar expressed in terms of the gold dollar and its decimal subdivisions ?

16. On a promissory note which has run 3 years, 7 months, and 7 days, at the rate of 7 per cent. per annum, \$126.09 $\frac{3}{8}$ interest has accrued. What is the amount of the note, reckoning 360 days to the year ?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. A quartermaster paid for transporting 131,215 pounds of hard bread a distance of 81 miles $2\frac{1}{2}$ cents per ton per mile; 513 enlisted men, 163 miles, $2\frac{1}{2}$ cents per mile for each man. He also paid \$500 per day for the use of a steamer from May 3 to September 2, 1864, (both days inclusive.) What was the total amount of the payments?

18. What amount in gold must be sold at a premium of $12\frac{3}{4}$ cents on the dollar in order to purchase \$16,750 in coupon ten-forty bonds at a premium of $10\frac{1}{2}$ per cent?

7.

ACCOUNTS.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. Thomas Jones is a disbursing officer of the United States. On the 1st of January, 1872, there was advanced to him \$6,000; on the 1st of April, 1872, \$2,500; on the 15th of May, 1872, \$1,761; and on the 1st of June, 1872, \$550.59. He has made disbursements to the amount of \$10,156; on \$5,000 he is entitled to a commission of $\frac{3}{4}$ per cent.; on \$3,000 to a commission of $\frac{3}{4}$ per cent., and on the remainder to a commission of 1 per cent.

State the account of the United States with Thomas Jones in the frame beneath.

--	--	--	--	--	--	--	--

8

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. During what war did the battle of Buena Vista take place?

21. What American general was killed at the battle of Bunker Hill?

22. When and where did General Robert E. Lee surrender?

23. What is the highest judicial tribunal in the United States?

24. When is the electoral vote cast?

25. Where is the island of San Juan?

26. Name the States and Territories lying on the northern frontier of the United States, extending from the Atlantic to the Pacific Ocean.

27. In the following list, state which are sea-ports and which inland cities: Boston, Tallahassee, Baton Rouge, Saint Augustine, Nashville, Syracuse, and Des Moines.

9

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

The deliberate expresion of human thawt; will allways asume A form, suposed to be adaptid. to the inteligence the tempur the taists and the ames; of those to whome it is addresed, he who speaks to an Audyence komposed of men of won clas. of won profesion of won party or of won sect will use a narrower vokabulary a more. Restrikted or a more sealect dyalect than he who expects too be hurd by a more varius and komprehensive. Surcle and a riter who appeals to a hole Peple who seeks to convince the understanding or inlist the sympathy's of a nation; must adopt a dicktion Employ arguements. And resort to ilustrations which shal; in there turn sute the comprehenshun and; Awaken the interest of men of every class and every kalling, whatever theirfore is desined for the ear or the perewsal of what we call the inlightened publick must be as miscelaneus in its composishun as that publick itself. And it can come home to the busums of awl only by useing both the speach which is comon too all and sunwhat of the special vokabulary which is pekulier to each.

10

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct such as contain errors in syntax:

I sold my horse and buggy for less than it cost.

The discomfiture and slaughter were very great.

Neither riches nor honors can satisfy an immortal spirit.

The Chinese wall is thirty foot high.

He was the greatest statesman of the two.

It cannot be me.

Did not Mary look most beautifully at the lecture?

Prudence and not pomp are the basis of his fame.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. What accounts are settled in the Third Auditor's Office?

2. What officer revises the accounts settled by the Third Auditor?

3. What is the force and effect of the Third Auditor's decision in any case? Has he any power to instruct or control disbursing officers, and can he make final decisions?

4. What military officers are allowed to disburse public money who are not required to give bonds?

5. Describe the character of the authorized expenditures made by pension agents?

6. What abstracts are used in rendering the accounts of disbursing commissaries of subsistence which are settled by the Third Auditor? Describe the purposes for which each is used.

7. What abstracts are used in rendering the accounts of officers of the Engineer Department? Describe the purpose for which each is used.

8. What evidence is required to authenticate a claim for property purchased or taken during the war of the rebellion, and what officer's approval is required to permit its allowance by the accounting officers?

9. What does the "general account of money advanced" show?

EXAMINATION No. 22.—PROMOTION.

FIRST COMPTROLLER'S OFFICE,
January 23, 1873.

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth ?
5. State briefly as to your education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Fifty-three thousand and two.

Twenty-three millions five thousand and twenty-one.

Four hundred millions and six, and decimal one hundred and twenty-three hundred-thousandths.

10. Write at length the numbers expressed by following figures :

247,601.

971,345,201.

275.0301.

1,275,630.10003.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

\$109,741,134 10	\$109,741,134 10
209,464,215 25	209,464,215 24

150,476 14	150,476 14
	103,880 82
	149,004 15
	175,111 81
	193,636 59
	269,803 41
	315,022 36
	205,217 87
	379,558 23
	384,720 19
	445,485 18
	464,546 52
	427,124 98
	337,032 62
	315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. A person having invested \$10,000 in six per cent. stocks at par, sold out at the end of the year at 92½, and invested the proceeds in 5 per cents. at 65. What was the difference in his annual income, and in favor of which kind of stock?

13. Two persons invested in United States 7.30 notes \$1,600, and selling them in the market cleared \$300. The gain and stock of one amounted to \$1,140. What were the respective shares of the common stock, and also of gain of each of the parties?

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. A person residing in New Orleans owed me \$500, and sent me a draft for the exact amount, which cost me ¾ per cent. to get cashed. How much does he still owe me, and for what sum should the draft have been made to net me \$500?

15. In adjusting the accounts of internal-revenue collectors, as an item of credit for the salary prescribed by law, (\$1,500,) would two collectors who had served a fractional period of twelve days each, the one in December and the other in January of a common year, be entitled to the same amount; and if not, which would be entitled to the larger sum, and how much?

16. If the Secretary of the Treasury were to sell \$1,000,000 gold at \$1.12½, and buy the same amount of bonds at \$1.11¼, how much more is made by the transaction than if he had called the bonds, and what is the per cent. of gain?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. A consul has due him a balance of \$475, for which he desires to draw on London, exchange being at the rate of 5 per cent. loss on the face of his draft. For what amount in sterling money must he draw in order to realize the balance due him, the pound sterling being valued at \$4.84?₁₀₀?

18. A consul at a salary of \$1,500 per annum renders his account from June 20, 1872, to September 30, 1872, *both days inclusive*, and credits \$217.⁸³₁₀₀ fees received by him during said period. For what amount is he entitled to draw, exchange being at the rate of 3½ per cent. loss on the face of his draft?

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. What States seceded from the Union in the late civil war?

21. When was Abraham Lincoln assassinated?

22. Who was the first Vice-President of the United States?

23. What are Congressmen at large, and how are they elected?

24. How is the President of the United States chosen?

25. In the following list state which are rivers and which lakes: Missouri, Pontchartrain, Erie, Ohio, Colorado, and Champlain.

26. Through what rivers, lakes, and gulf do the waters of Lake Superior pass on their way to the Atlantic Ocean?

27. What States border on the Atlantic Ocean?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Now if the revival of the english nashunality had meant the expulshun of the dominant norman race. This would verry probably have bin, the course taken. And the reactshun would have put under a kommon bann langwidge and institooshuns alike, But happily it ment know sutch thing; it ment the blending of the two rases into wun, the forming of a new english nashun, by the gradyoual coalishun of the two by the growing consciousness that this england was the equal heratage of both. The well-fair of which was the kommon interest of both; it was not on either side a tryumph or rather as are awl rekonsiliations it was on both sides a tryumph, but where under these cercumstances should a suply of the new necesitys be so naturally look for as frum the french.—That was the langwidge of one of the partys in this happy transactshun, of the one which in respect of langwidge was giving up far the most and whitch therefour might farely look for this parshal compensashun.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct such as contain errors in syntax:

Wisdom and not wealth procure esteem.

I would not act thus if I was him.

Which is the prettiest of the two?

A just man will deal justly, and a foolish man will act foolishly.

Milton is an author who I am much delighted with.

Neither John or James will send their books.

It is etiquette not to set down in the presence of royalty.

The world's government is not left to chance.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. When, and under what law, was the office of Comptroller established?

2. What are the powers and duties of the Comptroller?

3. State, in detail, the manner of obtaining a draft upon the Treasury for the amount found due upon an account rendered to the First Auditor of the Treasury, other than an account arising under the revenue collection laws?

4. Explain the difference between an ordinary pay warrant and a covering warrant?

5. Are marshals of the United States, commissioners of courts, United States attorneys, and clerks compensated by fees or salaries?

6. What are the different grades of our diplomatic and consular agents employed in foreign countries, and how are they compensated?

7. How often are collectors required to render their accounts as disbursing agents, and are they adjusted at the Department monthly or quarterly?

8. By what method can a balance be paid to a collector which has been found due to him on his revenue account?

EXAMINATION No. 23—PROMOTION.

SECOND COMPTROLLER'S OFFICE, *January 23, 1873.*

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name ?

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The quartermaster at Leavenworth, Kansas, purchased 75,000 pounds of corn, at $31\frac{1}{2}$ cents per bushel, (56 pounds to the bushel ;) 32,113 pounds of oats, at $32\frac{1}{2}$ cents per bushel, (32 pounds to the bushel ;) and 79,500 pounds of hay, at $\$22.37\frac{1}{2}$ cents per ton, (2,000 pounds to the ton.) What was the total cost of the purchase ?

13. An officer of the Treasury Department collected \$17,850, and deposited \$17,493 in the Treasury, retaining the remainder as his commission. What was the rate per cent. of the commission on the amount collected?

5.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

15. What is the amount of pension payable to the widow of a private soldier at \$8 per month for herself, and \$2 per month for each of five children, from the 15th day of August, 1868, to the 21st of June, 1871, including both days, and reckoning thirty days to the month?

6.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

18. The weight of the United States double-eagle is 1.075 ounces troy. The intrinsic value of a given weight of standard gold is 15.6 times that of an equal weight of standard silver. What is the gold value of an ounce of standard silver?

7.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. A collector, on 1st of January, 1871, was indebted to the United States to the amount of \$928.50. An advance of \$420 was made to him. He paid out on account of salaries of employes, \$628.50; contingent expenses, \$42.31; for his own salary, \$62.50; and for commissions, $2\frac{1}{2}$ per cent. on \$2,400. State the collector's account with the United States in the frame beneath.

[illegible]

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. What States seceded from the Union in the late civil war?
21. When was Abraham Lincoln assassinated?
22. Who was the first Vice-President of the United States?
23. What are Congressmen at large, and how are they elected?
24. How is the President of the United States chosen?
25. In the following list, state which are rivers and which lakes: Missouri, Pontchartrain, Erie, Ohio, Colorado, and Champlain?
26. Through what rivers, lakes, and gulf do the waters of Lake Superior pass on their way to the Atlantic Ocean?
27. What States border on the Atlantic Ocean?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Now if the revival of the english nashunalite had ment the expulshun of the dominant norman race. This would verry probably have bin, the course taken. And the reactshun would have put under a kommon bann langwidge and institooshuns alike, But happily it ment know sutch thing; it ment the blending of the too rases into wun, the forming af a new english nashun, by the gradyoual coalishun of the two by the growing consciousness that this england was the equal heratage of both. The wellfair of which was the kommon interest of both; it was not on either side a tryumph or rather as are awl rekonsiliations it was on both sides a tryumph, but where under the cercumstances should a suply of the new necesitys be so naturally look for as from the french.—That was the langwidge of one of the partys in this happy transactshun, of the one which in respect of langwidge was giving up far the most and whitche therefour might farely look for this parshal compensashun.

10

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct such as contain errors in syntax;

Wisdom and not wealth procure esteem.

I would not act thus if I was him.

Which is the prettiest of the two?

A just man will deal justly, and a foolish man will act foolishly.

Milton is an author who I am much delighted with.

Neither John or James will send their books.

It is etiquette not to set down in the presence of royalty.

The world's government is not left to chance.

11

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply :

1. What are the duties of the Second Comptroller's Office ?
2. Under existing laws and regulations, what amounts are officers entitled to receive for commutation of quarters and fuel ?
3. What is the rate of pay of a private soldier for extra duty as now established ?
4. How many distinct classes of pensioners are there under the laws of the United States ?
5. How are they distinctively designated ?
6. How many agents for paying pensions are there in the United States ?
7. What bounty would be due a soldier who enlisted in the volunteer service July 1, 1861, for three years ; who was discharged and re-enlisted November 1, 1863, for three years, and who was mustered out May 15, 1865, his service being no longer required ?
8. What bounty would be due a soldier who enlisted in the volunteer service August 1, 1864, for three years, and who was discharged March 1, 1866, his service being no longer required ?

EXAMINATION No. 24.—PROMOTION.

FIRST AUDITOR'S OFFICE, *January 23, 1873.*

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name ?
2. Residence ?
3. Place of birth ?
4. Date of birth ?
5. State briefly as to your education.
6. What subsequent experience in business or profession ?
7. What clerical experience ?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers :

Fifty-three thousand and two.

Twenty-three millions five thousand and twenty-one.

Four hundred millions and six, and decimal one hundred and twenty-three hundred-thousandths.

10. Write at length the numbers expressed by following figures :

247,601.

971,345,201.

275.0301.

1,275,630.10003.

3.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains :

\$109,741,134 10	\$109,741,134 10
209,464,215 25	209,464,215 25
309,226,813 42	309,226,813 42
266,027,537 43	266,027,537 43
191,087,589 42	191,087,589 41
158,356,460 86	158,356,460 86
311,533 83	311,533 83
194,572 32	194,572 32

	193,636 59
	269,803 41
	315,022 36
	205,217 87
	379,558 23
	384,720 19
	445,485 18
	464,546 52
	427,124 98
	337,032 62
	315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The quartermaster at Leavenworth, Kansas, purchased 75,000 pounds of corn, at $31\frac{1}{4}$ cents per bushel, (56 pounds to the bushel;) 32,113 pounds of oats, at $32\frac{1}{2}$ cents per bushel, (32 pounds to the bushel;) and 79,500 pounds of hay, at $\$22.37\frac{1}{2}$ cents per ton, (2,000 pounds to the ton.) What was the total cost of the purchase?

Give the operation and result in common fractions.

13. An officer of the Treasury Department collected $\$17,850$, and deposited $\$17,493$ in the Treasury, retaining the remainder as his commission. What was the rate per cent. of the commission on the amount collected?

Write the answer in words.

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. The rate of duty on certain wine being one dollar per gallon, and twenty-five per cent. ad valorem (or upon the value) and three cents on each bottle, give the total duty on 839 bottles, (each containing one quart,) and costing $\$2.93$ per gallon.

15. What is the amount of pension payable to the widow of a private soldier at $\$8$ per month for herself and $\$2$ per month for each of five children, from the 15th day of August, 1868, to the 21st of June, 1871, including both days, and reckoning thirty days to the month?

16. At what rate per cent., simple interest, must $\$1,560$ be lent to gain $\$426.83\frac{1}{2}$ in 2 years, 8 months, and 25 days, reckoning 360 days to the year?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. If seven $\$100$ United States five-twenty bonds are purchased at the following rates in currency, viz: $111\frac{1}{8}$, 112 , $113\frac{3}{8}$, $112\frac{1}{4}$, $113\frac{1}{4}$, $113\frac{1}{8}$, and $113\frac{7}{8}$, what is the average price paid, and what is the average cost in gold at 15 per cent. premium?

18. The weight of the United States double-eagle is 1.075 ounces troy. The intrinsic value of a given weight of standard gold is 15.6 times that of an equal weight of standard silver. What is the gold value of an ounce of standard silver?

Give the operation and result in decimal fractions.

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. A collector, on 1st of January, 1871, was indebted to the United States to the amount of \$927.50. An advance of \$420 was made to him. He paid out on account of salaries of employes, \$628.50; contingent expenses, \$42.31; for his own salary, \$62.50; and for commissions, 2½ per cent. on \$2,400. State the collector's account with the United States in the frame beneath.

[illegible]

20.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. What States seceded from the Union in the late civil war?

21. When was Abraham Lincoln assassinated?

22. Who was the first Vice-President of the United States?

23. What are Congressmen at large, and how are they elected?

24. How is the President of the United States chosen?

25. In the following list, state which are rivers and which lakes: Missouri, Pontchartrain, Erie, Ohio, Colorado, and Champlain.

26. Through what rivers, lakes, and gulf do the waters of Lake Superior pass on their way to the Atlantic Ocean?

27. What States border on the Atlantic Ocean?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Now if the revival of the english nashunality had meant the expulshun of the dom-

inent norman race. This would verry probably have bin, the course taken. And the reacshun would have put under a kommon bann langwidge and institooshuns alike, But happily it ment know sutch thing; it ment the blending of the too rases into wun, the forming of a new english nashun, by the gradyonal coalishun of the two by the grow-ing consiousnes that this england was the equal heratage of both. The wellfair of which was the kommon interest of both; it was not on either side a tryumph or rather as are awl rekonsiliations it was on both sides a tryumph, but where under these cer-cumstances should a suply of the new necesitys be so naturaly look for as frum the french.—That was the langwidge of one of the partys in this happy transacshun, of the one which in respect of langwidge was giving up far the most and whitch therefour might farely look for this parshal compensashun.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct such as contain errors in syntax:

Wisdom and not wealth procure esteem.

I would not act thus if I was him.

Which is the prettiest of the two?

A just man will deal justly, and a foolish man will act foolishly.

Milton is an author who I am much delighted with.

Neither John or James will send their books.

It is etiquette not to set down in the presence of royalty.

The world's government is not left to chance.

11.

LETTER AND BRIEF

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. What are the powers and duties of the First Auditor of the Treasury?

2. What classes of accounts are settled in his office?

3. Name the divisions into which his office is divided, and briefly describe the duties of each.

4. What is the Treasury rule for the calculation of salaries fixed by the year, for shorter periods than one year?

5. How are funds for disbursement obtained from the Treasury by disbursing agents?

6. Does an appeal lie to the Secretary of the Treasury from the decision of the First Comptroller on a question of account?

7. What is the purpose of a covering warrant?

EXAMINATION No. 25.—PROMOTION.

LOAN BUREAU, OFFICE SECRETARY OF THE TREASURY,

January 23, 1873.

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth?

4. Date of birth?

5. State briefly as to your education.

6. What subsequent experience in business or profession?

7. What clerical experience?

8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers :

Fifty-three thousand and two.

Twenty-three millions five thousand and twenty-one.

Four hundred millions and six, and decimal one hundred and twenty-three hundred-thousandths.

10. Write at length the numbers expressed by following figures :

247,601.

971,345,201.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. If seven $\$100$ United States five-twenty bonds are purchased at the following rates in currency, viz: $111\frac{1}{8}$, 112 , $113\frac{3}{8}$, $112\frac{1}{4}$, $113\frac{1}{4}$, $113\frac{1}{8}$, and $113\frac{7}{8}$, what is the average price paid, and what is the average cost in gold at fifteen per cent. premium?

18. The weight of the United States double-eagle is 1.075 ounces troy. The intrinsic value of a given weight of standard gold is 15.6 times that of an equal weight of standard silver. What is the gold value of an ounce of standard silver?

Give the operation and result in decimal fractions.

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. A collector, on 1st of January, 1871, was indebted to the United States to the amount of $\$927.50$. An advance of $\$420$ was made to him. He paid out on account of employes, $\$628.50$; contingent expenses, $\$42.31$; for his own salary, $\$62.50$; and for commissions, $2\frac{1}{8}$ per cent. on $\$2,400$. State the collector's account with the United States in the frame beneath.

8.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answer to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

20. What States seceded from the Union in the late civil war?
21. When was Abraham Lincoln assassinated?
22. Who was the first Vice-President of the United States?
23. What are Congressmen at large, and how are they elected?
24. How is the President of the United States chosen?
25. In the following list, state which are rivers and which lakes: Missouri, Pontchartrain, Erie, Ohio, Colorado, and Champlain.
26. Through what rivers, lakes, and gulf do the waters of Lake Superior pass on their way to the Atlantic Ocean?
27. What States borders on the Atlantic Ocean?

9.

ORTHOGRAPHY AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it on the examiner's desk.

The answer must be given immediately under the question.

28. Copy the following passage clearly and legibly, correcting mistakes of spelling and punctuation, but not otherwise altering either the words or their order:

Now if the revival of the english nashunality had meant the expulshun of the dominant norman race. This would verry probably have bin, the course taken. And the reactshun would have put under a kommon bann langwidge and institooshuns alike, But happily it ment know sutch thing; it ment the blending of the too rases into wun, the forming of a new english nashun, by the gradyoual coalishun of the two by the growing consiousness that this england was the equal heratage of both. The wellfair of which was the kommon interest of both; it was not on either side a tryumph or rather as are awl rekonsiliations it was on both sides a tryumph, but where under these cercumstanses should a suply of the new necesitys be so naturaly look for as from the french.—That was the langwidge of one of the partys in this happy transactshun, of the one which in respect of langwidge was giving up far the most and whitch therefour might farely look for this parshal compensashun.

10.

SYNTAX.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

29. Copy the following sentences, and correct such as contain errors in syntax:

Wisdom and not wealth procure esteem.
 I would not act thus if I was him.
 Which is the prettiest of the two?
 A just man will deal justly, and a foolish man will act foolishly.
 Milton is an author who I am much delighted with.
 Neither John or James will send their books.
 It is etiquette not to set down in the presence of royalty.
 The world's government is not left to chance.

11

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. What is a port of entry?
2. What is a port of delivery?
3. How long can goods remain in bonded warehouse?
4. What is done with them at the expiration of that time?
5. How long a time is generally allowed for a vessel to unlade?
6. What is done with goods remaining on board at the expiration of that time?
7. What additional charge is made on goods remaining more than one year in warehouse?

EXAMINATION No. 27.—PROMOTION.

BUREAU OF STATISTICS, *January 23, 1873.*

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?
2. Residence?
3. Place of birth?
4. Date of birth?
5. State briefly as to your education.
6. What subsequent experience in business or profession?
7. What clerical experience?
8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ARITHMETICAL.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

9. Write in figures the following numbers:

Fifty-three thousand and two.

Twenty-three millions five thousand and twenty-one.

Four hundred millions and six, and decimal one hundred and twenty-three hundred-thousandths.

10. Write at length the numbers expressed by following figures:

247,601.

971.345,201.

275.0301.

1,275,630.10003.

3.

Upon completing the answers to the questions, the candidate should note on the

paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

11. Add the following columns of figures, and give each answer immediately under the column to which it pertains:

\$109,741,134 10
 209,464,215 25
 309,226,814 42
 266,027,537 43
 191,087,589 41
 158,356,460 86
 311,533 83

 464,547 52
 427,124 98
 337,032 62
 315,783 47

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. The quartermaster at Leavenworth, Kansas, purchased 75,000 pounds of corn, at $31\frac{1}{4}$ cents per bushel, (56 pounds to the bushel;) 32,113 pounds of oats, at $32\frac{1}{2}$ cents per bushel, (32 pounds to the bushel;) and 79,500 pounds of hay, at $\$22.37\frac{1}{2}$ cents per ton, (2,000 pounds to the ton.) What was the total cost of the purchase?

Give the operation and result in common fractions.

13. An officer of the Treasury Department collected $\$17,850$, and deposited $\$17,493$ in the Treasury, retaining the remainder as his commission. What was the rate per cent. of the commission on the amount collected?

Write the answer in words.

5.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

14. The rate of duty on certain wine being one dollar per gallon, and twenty-five per cent. *ad valorem* (or upon the value) and three cents on each bottle, give the total duty on 839 bottles, (each containing one quart,) and costing $\$2.93$ per gallon.

15. What is the amount of pension payable to the widow of a private soldier at $\$8$ per month for herself and $\$2$ per month for each of five children, from the 15th day of August, 1868, to the 21st of June, 1871, including both days, and reckoning thirty days to the month?

16. At what rate per cent., simple interest, must $\$1,560$ be lent to gain $\$426.83\frac{1}{4}$ in 2 years, 8 months, and 25 days, reckoning 360 days to the year?

6.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

17. If seven \$100 United States five-twenty bonds are purchased at the following rates in currency, viz: $111\frac{7}{8}$, 112, $113\frac{3}{8}$, $112\frac{1}{4}$, $113\frac{1}{4}$, $113\frac{1}{8}$, and $113\frac{7}{8}$, what is the average price paid, and what is the average cost in gold at 15 per cent. premium?

18. The weight of the United States double-eagle is 1.075 ounces troy. The intrinsic value of a given weight of standard gold is 15.6 times that of an equal weight of standard silver. What is the gold value of an ounce of standard silver?

Give the operation and result in decimal fractions.

7.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

19. A collector, on 1st of January, 1871, was indebted to the United States to the amount of \$927.50. An advance of \$420 was made to him. He paid out on account of salaries of employes, \$628.50; contingent expenses, \$42.31; for his own salary, \$62.50; and for commissions, $2\frac{1}{8}$ per cent. on \$2,400. State the collector's account with the United States in the frame beneath.

11.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

30. Answer the following inquiries *seriatim*, in the form and style of a letter to the board of examiners, and fold and brief your reply:

1. In what year was the Bureau of Statistics established, and what are some of its principal objects of inquiry?

2. What are some of the leading monthly and quarterly returns, relative to commerce and navigation, received at the Bureau of Statistics?

3. Describe more in detail the character of that portion of them with which you are practically most familiar.

EXAMINATION No. 28.—PROMOTION.

HEAD OF DIVISION,
OFFICE OF INTERNAL REVENUE,
January 31, 1873.

Preliminary.

1.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

1. Name?

2. Residence?

3. Place of birth?

4. Date of birth?

5. State briefly as to your education.

6. What subsequent experience in business or profession?

7 What clerical experience?

8. State in what division of the office you are now employed, and the character of the duties you perform.

2.

ACCOUNTS.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

9. John Doe, an agent for the sale of stamps issued under Schedules B and C, advises the Commissioner that Richard Roe, another agent, has transferred to him the stamps remaining in his hands, amounting to \$1,500, and cash received from the sale of stamps, \$250; and that he (Doe) having decided to discontinue the sale of stamps, incloses a certificate of a deposit in the Treasury of the United States, amounting to \$5,500, together with the balance of stamps remaining in his hands, amounting to \$4,500.

The ledger accounts are "John Doe," "Richard Roe," "Office Stamp Account," "Treasurer of the United States," and "Commission;" what are the journal entries by double entry?

3.

ARITHMETICAL

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

10. Stamps of the value of \$1,500 have been furnished an agent for sale; what amount should he deposit to balance the account?

11. What tax would a brewer pay on the following packages of beer, viz:

146 packages, containing $\frac{1}{8}$ barrel each.

226 packages, containing $\frac{1}{6}$ barrel each.

195 packages, containing 1 hogshead each.

441 packages, containing $\frac{1}{4}$ barrel each.

4.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain. Show the operation at length in each case.

12. What is the present representative value of 99 books of sixty-gallon stamps, each book containing one hundred and fifty stamps, each denoting the tax on sixty gallons of spirits, with nine coupons attached to each stamp, representing the tax on nine gallons of spirits?

13. The internal-revenue tax levied by the United States on leather, in the year 1866, was at the rate of 6 per cent. on the value of the product, and the amount of revenue received on account of this product during the year was \$5,384,812.80. What was the value of the product?

14. What amount of gold must be sold at a premium of $13\frac{1}{2}\%$ in order to purchase \$19,350 coupon United States 6 per cent. bonds of 1881 at $117\frac{1}{2}\%$?

5.

ORTHOGRAPHY, SYNTAX, AND PUNCTUATION.

Upon completing the answer to the question, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answer must be given immediately under the question.

15. Copy the following passage clearly and legibly, correcting mistakes of spelling, syntax, and punctuation:

The duty's of collectors of Internal Revenew is multefareous and incompatable wholley with incompatance but it demands that a consistant and concientious course;

shall at all times be taken, this duty is required first to protect the interest of the government against them who seek to defraud them of their just and legal taxes regularly imposed by law. To arrest all infraction of law or regulation in their insipiancy to prevent any deficiencies in the sum which his deputy's collect and second at the same time to well gauge all acts of his so that a Citizen and Taxpayer may not have been subject to unnecessary hardship and inconvenience so that the Law the arbitrariness may not be rendered odious but the duties of assessors have been in the past important none the less so in fact the assessments have been the basis of collections as formerly not any collections was collectable until after their assessment and the assessor has no legal authority to make revision of taxes assessed or either can he recind from his list names on them.

6.

HISTORY, GOVERNMENT, AND GEOGRAPHY.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

The answers must be given immediately under the questions to which they pertain.

16. Name the Presidents of the United States in their order.
17. Who was the first Secretary of the Treasury?
18. Name the Secretaries of the Treasury since March 4, 1861.
19. Name the Commissioners of Internal Revenue in the order of their appointment.
20. On what principle must direct taxes be apportioned among the several States?
21. Where must bills for raising revenue originate?
22. What is the provision of the Constitution by which authority is conferred on Congress to lay and collect internal taxes?
23. How only can money be drawn from the Treasury?
24. Name the principal mountain ranges, and three of the principal rivers of the United States. Give the general direction which the rivers flow, and name the bodies of water into which they empty.

7.

INTERNAL-REVENUE LAW.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

25. By what act of Congress was the office of Commissioner of Internal Revenue created?
26. By what act of Congress was the position in the office of Internal Revenue, known as Head of Division, created?
27. What are the three principal sources of internal revenue?
28. Give the dates of the approval of the principal acts of Congress now in force relating to tax on these articles?
29. Is there any internal-revenue tax upon articles exported to foreign countries?
30. What is the difference between imposts and excises?
31. Under existing laws, what special or license taxes are assessed, and when does the license year begin?
32. What documentary stamp duties are now in force?
33. What constitutes, in contemplation of law, the use of a documentary stamp?
34. What persons may be appointed agents for the sale of stamps under Schedules B and C?

8.

PRACTICE UNDER THE LAW.

Upon completing the answers to the questions, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

35. How is the capacity of a distillery ascertained?
36. What reports are required of collectors?
37. What reports are required of assessors?
38. What reports are required of internal-revenue gaugers?
39. What reports are required of internal-revenue store-keepers?

40. What returns are required of distillers?
41. What returns are required of brewers?
42. What returns are required of tobacco manufacturers?
43. What credits are allowed the Commissioner in the adjustment of his accounts with stamps issued under Schedules B and C?

9.

LETTER AND BRIEF.

Upon completing the letter, the candidate should note on the paper the exact time he has been engaged upon it, sign it, and place it upon the examiner's desk.

44. Describe the general features of the internal-revenue system, pointing out what, in your opinion, are its merits and defects, in a letter to the Secretary of the Treasury, and fold and brief your letter.

JAMES A. McCULLAH.

M E S S A G E

FROM THE

PRESIDENT OF THE UNITED STATES,

RETURNING

With his objections the bill of the House (H. R. 2852) for the relief of James A. McCullah, late collector of the fifth district of Missouri.

FEBRUARY 11, 1873.—Referred to the Committee of Ways and Means and ordered to be printed.

To the House of Representatives :

I have the honor to return herewith H. R. 2852, entitled "An act for the relief of James A. McCullah, late collector of the fifth district of Missouri," without my approval, for the following reasons: It is provided in section 34 of the act of June 30, 1864, as amended by the act of July 13, 1866, "That it shall be proved to the satisfaction of the Commissioner of Internal Revenue that due diligence was used by the collector, who shall certify the facts to the First Comptroller."

This bill, should it become a law, clearly excuses Mr. McCullah, late collector, from showing that he used due diligence for the collection of the taxes in question while the lists remained in his hands.

U. S. GRANT.

EXECUTIVE MANSION,
February 8, 1873.

LIEUTENANT R. H. PRATT.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

The claim of First Lieutenant R. H. Pratt, Tenth Cavalry.

FEBRUARY 11, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT, *February 7, 1873.*

The Secretary of War has the honor to return to the House of Representatives the claim of First Lieutenant R. H. Pratt, Tenth Cavalry, for the value of a horse taken and killed by Comanche Indians in 1869, valued at \$200, (Ex. Doc. 7, 42d Congress, 1st sess.,) inclosed in letter of the Committee on Military Affairs of the 31st ultimo, and to report to the House, for the information of said committee, that Lieutenant Pratt left his station at Fort Sill, Indian Territory, on the 21st October, 1869, on leave of absence; when his leave of absence expired, he was placed on detached duty, and on the 3d of June, 1870, he returned to his station at Fort Sill. He is still a first lieutenant in the Tenth Cavalry.

There is no record of the claim in this Department.

WM. W. BELKNAP,
Secretary of War.

Letter from the Secretary of the Interior, in relation to the claim of Lieutenant R. H. Pratt, United States Army.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., March 13, 1871.

SIR: I have the honor to transmit herewith a copy of a communication, dated the 9th instant, from the Acting Commissioner of Indian Affairs, reporting the claim of Lieutenant R. H. Pratt, United States Army, for the value of a horse taken and killed, by Comanche Indians in 1869, valued at two hundred dollars. The accompanying papers with the report are respectfully submitted to Congress, under the fourth section

of the act making appropriations for the Indian Department, approved July 15, 1870, for such consideration and action as may be deemed proper by that body.

Very respectfully, your obedient servant,

C. DELANO, *Secretary.*

HON. JAMES G. BLAINE,
Speaker of the House of Representatives.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., March 9, 1871.

SIR: I have the honor to submit herewith a claim of Lieutenant R. H. Pratt, United States Army, for the value of a horse taken and killed by Comanche Indians in 1869, \$200.

The testimony adduced, in my judgment, sustains the charge. On presentation of the case to the Comanches in council, by the United States agent, Laurie Tatum, in accordance with the requirement of the seventeenth section of the intercourse act of June 30, 1834, respecting claims for depredations by Indians, they admitted killing the horse, but refused to make satisfaction.

I respectfully recommend favorable consideration of the claim, and that it be laid before Congress for the action of that body, under the fourth section of the act making appropriations for the Indian Department, approved July 15, 1870.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

HON. C. DELANO,
Secretary of the Interior.

OFFICE KIOWA AGENCY,
Indian Territory, Twelfthmonth 5, 1870.

FRIEND E. HOAG, SUPERINTENDENT: The accompanying claim of Lieutenant R. H. Pratt for one horse was presented in council to the Indians. The Comanches admit killing the horse, but refused to make satisfaction.

Respectfully,

LAURIE TATUM,
United States Indian Agent.

FORT SILL, INDIAN TERRITORY, *July 27, 1870.*

SIR: I have the honor to submit the following statement and application to the Indian Department:

When I went on leave of absence in October, 1869, I left my horse to be taken care of in the company. I prized him highly, and in fact refused two hundred dollars for him just before going away, because I knew I could not replace him for that sum. I did not return until last month.

The horse was lost from the herd as explained by affidavit of Sergeant Stone, and I am assured that every effort possible was made for his recovery, but with no success.

I do not wonder that the Indians were loath to part with him, as he was by far the best saddle-horse in the six companies of cavalry serving at this post.

All the circumstances attending the loss that can be elicited are given in the papers appended hereto, and you will be able to see where the responsibility for his loss and death lies.

I claim that the Indian Department should re-imburse me to the extent of two hundred dollars for the loss, under the existing treaty between the United States and the Comanches, and request your action to that end.

I have never made any effort to retaliate upon the Indians, or to recover from them for the loss in question.

I have the honor to be, very respectfully, your obedient servant,

R. H. PRATT,
First Lieutenant Tenth Cavalry, Brevet Captain, United States Army.

LAURIE TATUM, Esq.,
United States Indian Agent for Kiowas, Comanches, and Apaches.

Personally appeared before me, Brevet Colonel W. W. Sanders, captain Sixth Infantry, judge-advocate general court-martial, Sergeant Arthur Stone, Company D, Tenth Cavalry, who, being duly sworn, deposes and says:

That on the 12th day of November, 1869, I was in charge of the horses of D company, Tenth Cavalry, while they were out grazing near Fort Sill, Indian Territory; that while they were being watered in Medicine Bluff Creek, the horses of Company C, Tenth Cavalry, were driven into the same place for water, and the two herds coming together created a temporary confusion, during which a large sorrel horse belonging to Brevet Captain R. H. Pratt, first lieutenant of the company, got separated from the herd and lost. After getting the herd quiet again, I looked thoroughly for the horse in the vicinity, but was unable to find him. I reported the loss to the first sergeant of the company about two hours after it occurred, and he sent me two men to help look for the horse, and under my instruction they made diligent and extended search. They reported that they heard from Indians of the horse going up Cache Creek with some Indian ponies, but did not feel justified in going so far away without orders; that the search for the horse was continued for several days, and information that the Comanche Indians in camp ten or twelve miles from Fort Sill up Cache Creek had him, was received. A short time after that I heard that the horse had been killed by the Indians.

ARTHUR STONE.

W. W. SANDERS,

Bvt. Col., U. S. A., Capt. Sixth U. S. Inf., Judge-Advocate G. C. M.

Personally appeared before me, Brevet Colonel W. W. Sanders, captain Sixth Infantry, judge-advocate general court-martial, Private Henry Johnson, Company D, Tenth United States Cavalry, who, being duly sworn, deposes and says:

That on or about the 14th day of November, 1869, he was sent to look for a large sorrel horse, the property of Brevet Captain R. H. Pratt, first lieutenant Tenth Cavalry, and which had been lost from the herd two days previous; that he got a Comanche Indian who could talk English to go with and assist him in the search; that they went to the Comanche camps up Cache Creek, ten or twelve miles from Fort Sill, Indian Territory, and that on inquiring they found that the horse had been picked up by the Indians in camp there, and was then in their herd about two miles away; that he was informed he could not have the horse without paying something for him, and having no money, he returned to Fort Sill and reported to Lieutenant Doyle, then in command of the company.

Sworn to and subscribed before me at Fort Sill, Indian Territory, this 26th day of July, 1870.

W. W. SANDERS,

Brevet Col., U. S. A., Capt. Sixth Infantry, Judge-Advocate, G. C. M.

Personally appeared before me, Brevet Colonel W. W. Sanders, captain Sixth Infantry, judge-advocate general court-martial, Ka-habbe-wath, a Pene-teth-ca Comanche Indian, to me well known, who deposes and says:

That early last winter, having lost some of his horses, he was out looking for them, when, about fifteen miles up Cache Creek from Fort Sill, he discovered a large sorrel horse with a blaze face, which, on being described to him, he believes to have been the sorrel horse owned by Captain R. H. Pratt, first lieutenant Tenth Cavalry, which had been lost while on herd near Fort Sill, Indian Territory, but a short time previous. At the time first seen, the horse was standing up and badly wounded. He went back to camp and reported to Qui-ne-habbe, and the next day he and Qui-ne-habbe went to the place and found the horse dead, and upon examination found it to be an arrow wound, and, looking for tracks near, they found prints of Comanche mocassins, and concluded the horse had been killed by some Indian or Indians of that tribe. Upon further examination we found that a clay-bank colored mare, which we recognized as

belonging to Captain J. W. Walsh, Tenth Cavalry, had also been shot with arrows near by the horse.

KA-HABBE-WATH, his + mark.

Witnesses: O. H. MOORE,
Brevet Lieut.-Col., and Captain Sixth Infantry.
GEO. T. ROBINSON,
Captain Tenth Cavalry.

I have faithfully and truly interpreted the foregoing.

H. P. JONES, *United States Interpreter.*

Sworn to and subscribed before me this 25th day of July, 1870, at Fort Sill, Indian Territory.

W. W. SANDERS,
Brevet Col. U. S. A., Capt. Sixth Infantry, Judge-Advocate G. C. M.

Personally appeared before me, W. W. Sanders, brevet colonel United States Army, captain Sixth Infantry, judge-advocate general court-martial, the undersigned, H. P. Jones, United States Indian interpreter, to me well known, who, being duly sworn, deposes and says:

That he was cognizant of the loss of Captain Pratt's horse in November, 1869; and being requested to make inquiries among the Indians for the horse, he done so, and was informed by Qui-ne-habbe, one of the chiefs of the No-co-nee Comanches, who is since deceased, and Ka-hab-be-wath, a Pene-teth-ca Comanche, that they had found a horse shot with arrows about fifteen miles above Fort Sill, which suited exactly the description of Captain Pratt's horse; that they believed the horse to have been shot by two young Cooch-cho-teth-ca Comanches, who had been in with Wow-way a few days before drawing rations. They were led to this belief by finding the trail of a small mule near, which answered the description of a mule rode by one of the young men.

H. P. JONES, *United States Interpreter.*

Sworn to and subscribed before me at Fort Sill, Indian Territory, this 25th day of July, 1870.

W. W. SANDERS,
Brevet Col. U. S. A., Capt. Sixth Infantry, Judge-Advocate G. C. M.

FORT SILL, INDIAN TERRITORY.

Personally appeared before me, the undersigned, William E. Doyle, second lieutenant Tenth Regiment United States Cavalry, who, being duly sworn, deposes and says:

That on or about the 12th day of November, 1869, a horse, the property of Brevet Captain R. H. Pratt, first lieutenant Tenth United States Cavalry, was taken from its herding-ground, near Fort Sill, by Indians, it being necessary at the time to herd the horses on account of the scarcity of forage. At the time the horse was taken, all the Indians attached to the Kiowa and Comanche agency were at peace with the Government. Captain Pratt was absent from Fort Sill at the time, and I endeavored to find what became of the horse. The Indians informed me that a horse answering the description of Captain Pratt's horse was at the No-co-nee camp, sixteen miles from Fort Sill. I sent a man to look for the horse, and he returned and informed me that the Indians would not let him have the horse. Shortly afterward Qui-ne-habbe, a head-man of the No-co-nee Comanches, told me that the horse was dead; that two young men of the Cooch-cho-teth-ca band of Comanches got that horse and a pony, and as they could not agree upon a division of the horses, they killed them both to prevent ill-feeling, such being the Comanche rule in those cases. Other Indians of the Pene-teth-ca band of Comanches also told me of the horse, and some of them had seen the horse in camp at Fort Sill frequently and knew that it belonged to Captain Pratt. Among the latter was a Pene-teth-ca man, named Pur-ra-habey. From the time that the man came in and told me that the Indians would not let him have the horse until I heard of the horse being killed was about three weeks, I think; and during that time I was carrying on negotiations for the horse with Indians, and had offered quite a large reward for his recovery. During this time, and at the time the horse was taken, I was in command of D company, Tenth Cavalry, of which Brevet Captain R. H. Pratt was first lieutenant.

WM. E. DOYLE,
Second Lieutenant Tenth United States Cavalry.

Witness: J. W. WALSH,
Captain Tenth Cavalry.

FORT SILL, INDIAN TERRITORY.

Sworn and subscribed to before me at Fort Sill, Indian Territory, this 26th day of July, 1870.

W. W. SANDERS,

Captain Sixth Infantry, Brevet Colonel U. S. A., Judge-Advocate.

FORT SILL, INDIAN TERRITORY,
July 26, 1870.

This certifies that I was well acquainted with the qualities of the large sorrel horse belonging to Brevet Captain R. H. Pratt, first lieutenant of my company, which was lost while on herd in November last; that I considered him one of the finest animals at this post, and in my opinion two hundred dollars was beneath his value.

J. H. WALSH,

Captain Tenth Cavalry, Commanding D Company.

FORT SILL, INDIAN TERRITORY,
July 26, 1870.

LIEUTENANT: In answer to your questions I would say that I do remember well your large sorrel horse, taken by Indians at this post last fall. I do not think he could be replaced for a less amount than two hundred dollars; would have been willing to have given you that price for him at any time.

GEO. T. ROBINSON,

Captain Tenth Cavalry.

Brevet Captain R. H. PRATT,

First Lieutenant Tenth Cavalry.

FORT SILL, INDIAN TERRITORY,
July 27, 1870.

At the request of Captain Pratt, Tenth Cavalry, regarding the value of a private horse taken and killed by Indians, at or near this post, I consider him well worth two hundred dollars, and would be willing to pay said price for such a horse.

ROBERT GRAY,

Captain Tenth Cavalry.

CHARLES B. MADDEN.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

The claim of Charles B. Madden, late first lieutenant Seventy-ninth Pennsylvania Volunteers.

FEBRUARY 11, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT, *February 7, 1873.*

The Secretary of War has the honor to report to the House of Representatives, for the information of the Committee on Military Affairs, in answer to letter of said committee of the 30th ultimo, requesting information concerning claim of Charles B. Madden, late first lieutenant Seventy-ninth Pennsylvania Volunteers, for traveling allowances, that the claim has never been submitted to this Department.

The records of the Seventy-ninth Pennsylvania Volunteers on file show that he was originally enrolled as an enlisted man, at Lancaster, Pennsylvania, on September 2, 1861, and his resignation as first lieutenant, tendered at Chattanooga, Tennessee, was accepted by Special Orders No. 93, dated August 5, 1864, from Headquarters Department of the Cumberland. It is proper to add that under the regulations of the Department officers discharged on tender of resignation are not entitled to traveling allowances.

The matter of traveling allowances is fully set forth in reports of the Second Comptroller, Adjutant-General, and Paymaster-General; in the supplemental brief for the United States, *The United States, appellants, vs. Jos. W. Price*, Supreme Court United States, 245, December term, 1869.

WM. W. BELKNAP,
Secretary of War.

CHARLES F. SMITH

LETTER

THE SECRETARY OF WAR

TO THE SECRETARY OF THE ARMY
WASHINGTON

DEAR SIR:

I have the honor to acknowledge the receipt of your letter of the 10th inst. in relation to the proposed purchase of the land at the mouth of the River, and in reply to inform you that the same has been referred to the proper authorities for their consideration. I am, Sir, very respectfully,
Yours, very truly,
Wm. W. Blackall

Wm. W. Blackall
Secretary of War

BERNHARD BERNSTEIN.

M E S S A G E

FROM THE

PRESIDENT OF THE UNITED STATES,

TRANSMITTING

A letter from the Secretary of State relative to the claim of Bernhard Bernstein.

FEBRUARY 11, 1873.—Referred to the Committee on Foreign Affairs and ordered to be printed.

To the House of Representatives:

In answer to a resolution of the House of Representatives of the 29th of January, requesting information in relation to the case of Bernhard Bernstein, I transmit herewith a report from the Secretary of State upon that subject, with accompanying documents.

U. S. GRANT.

WASHINGTON, *February 8, 1873.*

DEPARTMENT OF STATE,
Washington, February 8, 1873.

The Secretary of State, in answer to a resolution of the House of Representatives of the 29th of January, of which the text is as follows: "*Resolved, That the Secretary of State, if not incompatible with the public service, report to this House all correspondence in his Department with reference to the case and the claim of Bernhard Bernstein, a naturalized citizen of the United States, against Russia,*" has the honor to lay before the President the accompanying copy of papers, a list of which is subjoined, and which are all on record or on file in this Department, upon the subject of the resolution.

Respectfully submitted.

HAMILTON FISH.

The PRESIDENT.

List of papers.

1. Mr. Bernstein to Mr. Seward, October 31, 1864.
2. Mr. Seward to Mr. Clay, November 29, 1864.
3. Mr. Clay to Mr. Seward, December 17, 1864.
4. Mr. Lucas to Mr. Seward, August 16, 1865.

5. Same to same, February 10, 1868.
6. Mr. Seward to Mr. Lucas, February 13, 1868.
7. Mr. Buckley to Mr. Fish, July 19, 1871.
8. Mr. Hunter to Mr. Buckley, July 22, 1871.

No. 1.

Mr. Bernstein to Mr. Seward.

ISBICA, RUSSIA POLEN, *October 31, 1864.*
(Received 18th November.)

SIR: I am a naturalized citizen of the United States of America. In the month of January last I got granted a pass in your honory office, signed by your honor, William H. Seward, and sealed with the great seal of the United States of America. I took my departure from the Empire city, New York, in the month of May. June 22 I came through Berlin, Prussia, got my pass indorsed by his honor H. Kreismann, and also by his excellency Ambassador of Russia, past the lines into Polen in due form, came hereto, this day, my native place of birth, on no other business but to pay a visit to an old father of mine now living, thank God, aged eighty-three years. I staid here all the time without any molestation until Tuesday last, the 25th instant, when I was arrested, on what charge I know not. I was kidnaped, sent under a military escort to Wloclawek; there I was thrown in prison, kept as a common outlaw; but, fortunately, my friends got me out of prison on bail; my pass, together with the charges they brought against me, which charge never was read to me, they sent off to Warsaw, to headquarters. What the orders from there will be I can't tell.

But, as a citizen of the United States of America, I apply to your honor for protection, and, sir, I rely upon you that your honor will attend to it at once. As a citizen of the United States of America I appeal to the Government under which I have lived this last fourteen years, and under which I shelter myself, and which Government I expect to live the remainder of my days, to protect me. God bless the President, his cabinet, and the people at large.

I am, &c.,

BERNHARD BERNSTEIN,
A citizen of the United States of America.

No. 2.

Mr. Seward to Mr. Clay.

No. 104.]

DEPARTMENT OF STATE,
Washington, November 29, 1864.

SIR: I transmit herewith a copy of a letter addressed to this Department by Mr. Bernhard Bernstein, who claims the protection of this Government, and who states that having visited Isbica, Russia, for no other purpose than to see his aged father, he was arrested, and is now confined in that place. You are instructed to ascertain the circumstances attending the arrest and imprisonment of Mr. Bernstein, and if his statement shall prove to be well founded, to do what you properly can toward procuring his release.

I am, &c.,

WILLIAM H. SEWARD.

No. 3.

Mr. Clay to Mr. Seward.

No. 66.]

LEGATION OF THE UNITED STATES,
St. Petersburg, Russia, December 17, 1864.
 (Received January 14, 1865.)

SIR: I am in receipt of your dispatches to No. 104 inclusive, together with the inclosed documents.

In regard to Bernhard Bernstein I had already called the attention of the foreign department to his imprisonment, and asked the necessary explanations.

Poland is yet in an unsettled state, and I recommend all naturalized American citizens, born in that unhappy country, to stay away; as several rebels have used our passports for insurrectionary purposes, and this very naturally brings suspicion upon all persons going there at present.

Your obedient servant,

C. M. CLAY.

No. 4.

Mr. Lucas to Mr. Seward.

NORWICH, CONNECTICUT, *August 16, 1865.*
 (Received August 18.)

DEAR SIR: Inclosed please find passport and a letter from the Hon. C. M. Clay. The object of this communication is to call the attention of the United States Government to the outrage perpetrated on Bernhard Bernstein, that justice may be done, and he compensated for the loss he has sustained. At the time of the breaking out of the rebellion he was a resident of Georgia, and made his escape to the North in 1863, leaving all his property, and came to this city, where he formally resided. In 1864 he thought he would visit his native home, (Isbica, Poland,) and I applied for the passport inclosed for that purpose. He arrived home June 27, 1864, immediately reported to the military authorities, delivered his passport, and informed them that he was there on a visit to his native place, expecting soon to return to the United States. He was told by them to leave his passport, (which he did,) and if he wished to leave the place to visit other parts of Poland to call and get it. This you will notice he did once, by the indorsement of the commander, subsequently crossed (X) and pen drawn through his signature. On the 25th of October, when about to leave for this country, he was arrested, held thirty hours under military guard, and then sent to the county-seat (Wolclawek) under a military escort of three Cossacks, there imprisoned three and a half days, and only released upon the giving of bail by his brother and a rich neighbor of his brother, to the amount of all their property and their lives. His treatment while in prison he represents as indecently severe and shamefully insulting. When released upon the terms above named he applied to our minister at Berlin. He told him to address the Hon. C. M. Clay. He did so November 18, and received no answer; wrote him again in about six weeks and received no reply. On the 6th of March, 1865, he wrote to him again, and the answer to that letter is the one inclosed. Finally, receiving no relief, he went with his friends to Warsaw, and through their influence he was released.

The cause of his arrest was this: It seems he left his home about

eighteen years before, and it was claimed that subsequently he owed the Russian government military service. He assures me that they laughed at him when he reminded them that he was an adopted citizen, and sneeringly asked him when the Russian government gave him permission to become such. You will notice he was *detained in Poland nearly six months*, and, as he was the owner of a large amount of cotton, South, he has consequently suffered great damage.

He applied to me immediately on his return to the United States, but as you were at that time suffering from the murderous attack made on your life, and as the question involved is one of such great importance, I advised him to delay the matter till your health would permit you to give the subject your personal attention. I now respectfully ask that my client be remunerated. It seems to me that our adopted citizens are entitled to *protection*, and I have no doubt that our Government will insist that, when furnished with a passport, they cannot be deprived of their rights and our Government insulted with impunity. An early reply would oblige

Your most obedient servant,

SOLOMON LUCAS.

[Inclosure.]

Mr. Clay to Mr. Bernstein.

LEGATION OF THE UNITED STATES,

Saint Petersburg, Russia, March 15, 1865.

SIR: Your letter of the 2d of March, instant, is received. When your first letter was received I at once called upon Prince Gortchacow, by note, No. 49, November 13-25, ultimo, for an explanation of your case or your speedy liberation, to which note to this day I have received no answer. I will at once write another note urging your liberation.

I am, &c.,

C. M. CLAY.

No. 5.

Mr. Lucas to Mr. Seward.

NORWICH, CONNECTICUT, *February 10, 1868.*

(Received February 12.)

SIR: Will you please inform me of the condition and prospects of the claim of Bernhard Bernstein, a naturalized citizen, about which I have written you several times? You have the papers on file in your Department.

Yours, truly,

SOLOMON LUCAS.

No. 6.

Mr. Seward to Mr. Lucas.

DEPARTMENT OF STATE,

Washington, February 13, 1868.

SIR: Your letter of the 10th instant, relative to the alleged claim of Bernhard Bernstein against Russia, has been received. I have to inform you that no further action has been taken in this case.

I am, &c.,

WILLIAM H. SEWARD.

No. 7.

Mr. Buckley to Mr. Fish.

34 WEST TWENTY-EIGHTH STREET,
New York City, July 19, 1871. (Received July 20.)

DEAR SIR: I have the honor to invite your attention to the inclosed letters of Hon. E. S. Shorter, formerly a member of Congress of second district of Alabama, pertaining to the papers of Bernhard Bernstein, now filed in the Department of State.

Application was made by myself, in person, for Mr. Shorter to withdraw the papers and passport of Mr. Bernstein. This application was made last May. Nothing having been heard from the former application, I beg leave to renew it with a view of settling the claim against the Russian government.

I have, &c.,

C. W. BUCKLEY.

[Inclosure 1 in No. 7.]

Mr. Shorter to Mr. Buckley.

[Extract.]

OFFICE OF SHORTER & BROTHER,
 ATTORNEYS AND COUNSELORS AT LAW,
Eufaula, Alabama, June 3, 1871.

DEAR SIR: Your favor of the 29th ultimo was received this morning, and I note what you say about Mr. Bernstein's claim against the Russian government for illegal arrest and imprisonment. Do try to have his claim taken up and adjusted. I think it likely that, in my former letters, that I stated his claim was against the Prussian instead of the Russian government. Again, I have always written Bernstein's name as "Benjamin Bernstein." He writes his name "Bernhard Bernstein." They call him "Ben" and I supposed his name was Benjamin. Perhaps Bernhard means Benjamin. At any rate, his name is Bernhard Bernstein, and he claims \$60,000 damages for outrages perpetrated upon him by the Russian government, and all his papers are on file in the State Department. It is a good case.

[Inclosure 2 in No. 7.]

Mr. Shorter to Mr. Buckley.

OFFICE OF SHORTER & BROTHER,
 ATTORNEYS AND COUNSELORS AT LAW,
Eufaula, Alabama, July 15, 1871.

DEAR SIR: The pressing necessities of Mr. Bernhard Bernstein is my apology for again writing to you, and inquiring whether any action has yet been taken, or is proposed by the State Department toward indemnifying him for his unlawful punishment by the Russian government. It seems strange after so long delay that the Department will not act either one way or the other. I think the claim for heavy damages is meritorious, and that our Government ought to see that he is righted. If there is no chance to have the State Department consider his case, I will prepare a petition to Congress, and have it presented at next session. The petition will set forth all the facts, and the length of time the matter has been before the State Department, and how it has been treated by the administration. Our passports are entirely useless if the Government fails to protect its citizens abroad while engaged in no unlawful pursuits.

I hope the apparent indifference of the State Department to Mr. Bernstein's case may be explained upon some other hypothesis than that of ignoring the rights of American citizenship in other countries. Please take such steps as will secure some decisive action, either in favor of or against Mr. Bernstein's claims.

Very respectfully, &c.,

ELI S. SHORTER,
Attorney for B. Bernstein.

No. 8.

*Mr. Hunter to Mr. Buckley.*DEPARTMENT OF STATE,
Washington, July 22, 1871.

SIR: Your letter of the 19th instant relative to the case of Bernhard Bernstein, has been received. I have to state that the papers of Mr. Bernstein, having become a part of the records of this Department, cannot, pursuant to a rule of long standing, be withdrawn.

I have, &c.,

W. HUNTER.

PROCEEDS OF PROPERTY PERTAINING TO THE ARMY.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

The repeal of section 5 of the act of May 8, 1872, as applies to moneys or proceeds of property pertaining to the Army or under the control of the War Department.

FEBRUARY 11, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT,
Washington, D. C., February 5, 1873.

SIR: I have the honor to transmit herewith a communication recommending that so much of section 5 of an act approved May 8, 1872, as applies to moneys or proceeds of property pertaining to the Army or under the control of the War Department as an executive branch of the service, may be repealed; and I respectfully request that this subject may be brought to the attention of the House of Representatives at an early moment.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

The SPEAKER of the House of Representatives.

WAR DEPARTMENT,
Washington, D. C., February 5, 1873.

SIR: I have the honor to recommend that legislation be had to amend section 5 of an act approved May 8, 1872, entitled "An act making appropriations for the legislative, executive, and judicial expenses of the Government, for the year ending June thirtieth, eighteen hundred and seventy-three, and for other purposes."

The first part of the said section directs: "That all proceeds of sales of old material, condemned stores, supplies, or other public property of any kind, shall hereafter be deposited and covered into the Treasury as

miscellaneous receipts, on account of proceeds of Government property, and shall not be withdrawn or applied except in consequence of a subsequent appropriation made by law."

Upon an official communication touching this subject three officers, below mentioned, were asked to report any facts they might "deem worthy of note concerning the operation of the law herein mentioned."

From the replies received extracts are given as follows:

I. In view of the importance of the question raised in connection with these certificates of deposit, as presented in the remarks of Lieutenant Bradley, I have deemed it advisable to return them at once, without waiting for the data upon which to designate the appropriations.

The limited appropriations do not justify the Department in disposing of property without the means of replacing it.

The experience of the past six months * * * has clearly demonstrated the evil results of the law in its application to the Army appropriations, and the consequent embarrassment to this branch of the service. * * * The repeal of the section, which, for reasons already stated, is found to work so disadvantageously to the interests of the service cannot be urged too strongly.—(*Letter of Quartermaster-General Meigs, September 5, 1872.*)

II. It is respectfully submitted that, notwithstanding the amendment by the act of June 8, 1872, the act of May 8, 1872, requiring the proceeds of sales of public property to be covered into the Treasury as miscellaneous receipts, is, in its operation, detrimental to the best interests of the service, embarrassing to this Department and opposed to true economy. * * * The law above referred to does, by its operation, permanently divert a greater or less sum from the appropriation for Army subsistence. As examples of some of the ways in which this diversion is brought about five are mentioned.

Could the money obtained from the sale of the stores be applied to the purchase of fresh stores to replace those sold, the real expenditures of the Government would in nowise be increased, but the apparent expenditures would be lessened.

If the proceeds of these sales continue to go into the Treasury, and be there permanently diverted from the appropriation, it will probably result in a necessity for asking for larger appropriations, or, failing in obtaining such larger appropriations, in having to appeal to Congress for additional appropriations in the form of deficiency bills.—(*Letter of Commissary-General of Subsistence A. B. Eaton, December 27, 1872.*)

III. The act of May 8, 1872, even with the modification of June 8, 1872, is objectionable and embarrasses the public service, and, in my judgment, should be repealed by an act authorizing the procurement of new supplies with the proceeds of sales. Under such a law the emigrants and settlers on the frontiers could be supplied, as formerly, with good arms and ammunition for their protection against Indians.—(*Letter of Major S. V. Benét, by order of the Chief of Ordnance, January 9, 1873.*)

These extracts exhibit several of many reasons why said law does not operate satisfactorily. These several are deemed sufficient for me to respectfully recommend to Congress, as I do now, that so much of the said law as applies to moneys or proceeds of sales of property pertaining to the Army or under the control of the War Department may be repealed.

Very respectfully, your obedient servant,

WM. W. BELKNAP,
Secretary of War.

Hon. JAS. G. BLAINE,

Speaker of the House of Representatives Forty-Second Congress.

MIAMI INDIANS, AND THE RIGHTS OF SETTLERS ON THEIR
LANDS.

LETTER

FROM THE

SECRETARY OF THE INTERIOR,

RELATIVE TO

*The condition of the Miami Indians, and the rights of certain settlers upon
the lands of said Indians.*

FEBRUARY 11, 1873.—Referred to the Committee on Indian Affairs and ordered to be
printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 8, 1873.

SIR: I have the honor to transmit herewith a copy of a communication from Enoch Hoag, superintendent of Indian affairs for the central superintendency, dated Lawrence, Kansas, December 7, 1872, in regard to the condition of the Miami Indians, and the rights of certain settlers upon the lands of those Indians, and the necessity of some legislation for the purpose of protecting the interests of the Indians, and, at the same time, do justice to the settlers.

The subject requires the immediate attention of Congress, for, without legislative action, it is impossible to remove the difficulties and embarrassments that now exist or to do justice to the Indians and settlers. I invite special attention to the conclusions at which the superintendent arrives, viz, that the Miami Indians be settled at once in the Indian Territory, confederated, according to the desires of both tribes, with the Peorias; that the money due them, under former treaties, be paid, and that they be reimbursed for lands fraudulently taken by the act of 1858, to which reference is made in his letter.

Concurring in the general views of the superintendent, and in his recommendation for a final settlement of these difficulties, I beg to express the earnest desire that this subject may receive the immediate attention of the House of Representatives, through its Committee on Indian Affairs, to which committee, if it be proper, I beg to suggest that this letter, with Mr. Hoag's communication, be referred.

Very respectfully, your obedient servant,

C. DELANO,
Secretary.

The Hon. SPEAKER of the House of Representatives.

OFFICE OF INDIAN AFFAIRS,
CENTRAL SUPERINTENDENCY,
Lawrence, Kansas, Twelfthmonth 7th, 1872.

Hon. C. DELANO,

Secretary of the Interior, Washington, District of Columbia :

Referring to a letter from this office to the honorable Commissioner, of Secondmonth 10th last, submitting report of negotiations, under instructions from the Department for the transfer of lands of certain Miami Indians to settlers thereon for a consideration mutually agreed upon by the parties in interest, (see Department letter August 5, 1871, and papers connected therewith, to which I call especial attention,) and also referring to personal interview between the honorable Secretary and myself on the 10th of October last on the cars *en route* to Washington, I desire to say, this office has labored long, earnestly, and impartially for the interests of this people, and, as will be observed by reference to letter of Fifthmonth 5th, 1871, succeeded in obtaining a proposition from the Indians acceptable to the settlers, by which the former might receive from the latter an approximate value for their lands. This proposition was indorsed, with certain modifications, and returned by Acting Commissioner Clum, with instructions, under direction of the honorable Secretary of the Interior, to complete the negotiations (see Department letter above referred to) subject to ratification by Congress. In accordance with said instructions, this office labored in good faith, and perfected arrangements with a majority of the settlers; and could the congressional aid, referred to in Commissioner's letter, have been realized to confirm the negotiations, and in accordance with recommendations from this office could they have been allowed, in accordance with the oft-expressed desires of both the tribes in interest, to remove to and become incorporated with the Peorias, Weas, &c., this perplexing question would have ceased to trouble the Department, and the Indians referred to would have been comfortably settled in the Indian Territory.

These people, having their all at stake, dependent solely upon the legislation of Congress, knowing full well that designing men were at work, in and out of Washington, to secure their few remaining lands, for a mere moiety, to rob them of the greater portion of their annuities, naturally desired to be heard in the premises, and asked and asked permission to visit Washington for that purpose about one year ago.

In reply, this office was requested to inform them "that it is not deemed necessary at this time to visit this city, (Washington,) and that their interests will be attended to by this office," (see Commissioner's letter January 15, 1872.) Apprehending that advantage would be taken of their absence by the parties referred to, to misrepresent them, they repeated the request all the time, urging, as an ultimate object, their consolidation with the Peorias. This office, in view of the importance of their affairs pending before Congress, indorsed there quest, (see letter Secondmonth 3, 1872.)

By Commissioner's letter in answer thereto, "February 4," it will be seen they are again promised "their interests will be attended to by this office," and they are again refused permission to visit Washington. Now for the first time the honorable Commissioner informs this office that if they desire to join the Peorias at all they must do so as individuals, after having been citizenized against their will, and, but for their persistency, without their knowledge. And this because the twenty-sixth article of the omnibus treaty of 1867 limits the time for their consoli-

dation to two years, while it was always understood by them and by this office that congressional aid must be had to enable them to dispose of their property and effect said consolidation, and for this very reason, with others, they asked to be represented in Washington.

The necessity of first passing a bill to citizenize these Indians against their will, to force them (if they join at all) to join the Peorias as individuals, losing their identity as Miamies, is hardly apparent. But they are informed that a "bill is already before Congress, which meets the approval of the Department," and this bill dissolves their relations as Miamies.

The Miami chiefs hardly recognize this approval of the Department as attending to their interest as promised.

It may be assumed that they, as ignorant Indians, are not cognizant of their own wants, and that their interests might be faithfully attended to, even in opposition to their wishes; but if they have not the capacity to judge for themselves, it would seem hardly consistent, in such a condition, to force upon them citizenship.

Again, it will be observed, that the mutual arrangements between themselves and the settlers heretofore referred to, provide for the payment of the original appraisement value of their lands in 1860, and 7½ per cent. per annum added to date of sale, or from 80 to 90 per cent. advance instead of twenty per cent. as provided in the bill (Shanks's bill) before Congress, which they are informed has the approval of the Department, and through which they expected the promised Department aid.

It may reasonably be asked by what moral or even legal right is it presumed to legislate for these Indians, involving in such legislation the vested rights of the tribe, without their knowledge or consent?

I can find no such authority, except it be contained in the eleventh article of the treaty of 1854, and a careful reading of said article convinces me clearly that Congress can only make such provisions by law, as experience shall prove to be necessary, to advance the interests of said Indians, and surely it will not be claimed by the advocates of the bill in question, which reduces the price to be paid for their lands to two-thirds the amount actually agreed upon between themselves and the purchasers, and upon which contract a cash payment has already been made, that such a law is necessary to advance the interests of the tribe.

The question naturally arises, in the perusal of the bill, who constitute the Miami tribe of Indians and to whom do their lands in Kansas belong? I find in the last clause of the sixth article of the treaty of 1838 the following words, to wit:

Nor shall any person or persons other than the members of said tribe, who may, by sufferance, live on the land of, or intermarry in said tribe, have any right to the land, or any interest in the annuities of said tribe, until such person or persons shall have been by general council adopted into their tribe.

By article 10 of the same treaty, the United States stipulated "to possess the Miami tribe of Indians of, and guarantee to them forever, a country west of the Mississippi River, to remove to and settle," &c., (not to remain in Indiana and receive their proportionate share,) "and when the said tribe shall have emigrated, the United States shall protect the said tribe," &c., &c.

By the treaty of 1840, which appears to have been finally adopted, with amendments, May 15, 1841, the location and boundaries of the lands set apart for the Miami tribe, west of the Mississippi, were defined, and it was therein stipulated that they should remove thereto within five years. The tract of land thus set apart for their occupancy was estimated to contain five hundred thousand acres.

It also appears from the treaties referred to, that the consideration for the lands ceded to the United States, by virtue of said treaties, was stipulated to be paid to said tribe in money, and in no case was the tract of land set apart for their future homes referred to as even part consideration for the land ceded to the Government east of the Mississippi.

On the contrary, it appears to have been promised them wholly in consideration of occupancy, in the language of the treaty, "to remove to and settle on." I apprehend it will not be claimed by the advocates of the bill, that any portion of the so-called Miami lands of Kansas would be recognized as the property of the tribe if they had not removed to and settled upon them. This was the only condition imposed upon them as the price of the inheritance; the Miamies of Kansas paid the price, and in equity, at least, are entitled to the proceeds of the same.

By the treaty of 1854, it is observed that certain chiefs, "Big Legs" and others, residing in Kansas, and representing the Miami Indians of Kansas, were recognized by the Government as delegates representing the Miami tribe of Indians, and treated with as such, while the five Indians, resident of the State of Indiana, were not so recognized in the preamble, but were required by the Senate amendment to article 4 to "take the opinion of their people, on their return home, and advise the Department without delay;" and appended to the Senate amendments appears the following article, to wit:

The Miami Indians, of Indiana, being now represented in Washington by a fully authorized deputation, and having requested the foregoing amendments, the same are binding on them, &c.

Now the treaty-making power of the Government did recognize a delegation of Indiana Miamies as fully competent to negotiate with the Government, and with the Western Miamies in all matters involving a common tribal interest, and by that treaty the common funds of the tribe were divided, in a manner satisfactory to both Eastern and Western Miamis; a portion of their reserve in Kansas was ceded to the United States, but no portion of the proceeds was even claimed by the Indiana Miamies, for the very good reason they had no interest in it, and if any evidence is wanted to confirm this view of the case, the treaty itself seems to furnish just that kind of evidence. The second article thereof states that each individual, or head of family, of the Miami tribe, "now residing on said lands," (surely not those residing in Indiana, who never saw them,) "shall select, if a single person, two hundred acres, and if the head of a family, a quantity equal to two hundred acres for each member of the family," &c., "and if, by reason of absence, or otherwise, any single person or head of family, entitled to land, as aforesaid, shall fail to make his or her selection within the period prescribed, the chiefs of the tribe shall proceed to select the lands for those in default." Further on, in the same article, appears the following language, to wit:

Provided, That if any single person, or head of family entitled to land, shall have been overlooked or wrongfully excluded, and shall make the fact appear to the satisfaction of the chiefs, such person or family may, with the approbation of the Commissioner of Indian Affairs, receive their quantity, &c.

Now to whom do these provisions apply? Can they, by any language used in said article or treaty, be made to apply to others than those for whom the article was expressly inserted? The provision bears its own unmistakable evidence: "those now residing on said lands," "who by absence or otherwise have failed to make their selections," or, "who have been overlooked or wrongfully excluded;" and in either case a specific remedy is therein provided, through the chiefs in both cases, but requiring the approbation of the Commissioner of Indian Affairs in the

latter. But the proposed bill at this time seeks to incorporate into the tribe, before dissolving its tribal organization, for the apparent purpose, and no other, of receiving a share of the funds to be divided at its dissolution, a class of people claiming some Miami blood, but who to this day have never been recognized as Miamies, either by the tribe in Kansas or by those residing in Indiana, who, it is certain, have never joined the tribe in Kansas, and until now have claimed no benefits from their annuities. They are residents of Indiana, and for whom if they ever had any rights, (which is by no means admitted by the chiefs and council,) the treaty of 1854 made provision, (second article, and also Senate amendments,) "the Miami Indians of Indiana being now represented in Washington, by a fully authorized deputation," &c. If the Senate was imposed upon at the time of making the treaty, it was in consequence of the failure of the "fully authorized deputation" from Indiana to report their numbers.

The tribe in Kansas acted in good faith, and cannot in any moral or legal sense be made to suffer, by a failure of the treaty to provide for all of the Indiana Miamies. Ordinarily the chiefs of a tribe are presumed to know who are entitled to tribal membership and who are not, and their decisions in council are regarded as final and conclusive; hence the reference of this matter to them by the second article was very properly made, and in this case seems to me especially binding on account of its reference as aforesaid.

But the advocates of the present bill claim another provision of the same treaty of 1854, applicable to this case, and from which they claim authority to entail these residents of Indiana upon the Miami tribe in Kansas by legislation, and without the consent of the tribe, to wit:

ART. 11. The object of this instrument being to advance the interests of said Indians, it is agreed, if it prove insufficient, from causes which cannot now be foreseen, to effect these ends, that the President may, by and with the advice and consent of the Senate, adopt such policy in the management of their affairs as, in his judgment, may be most beneficial to them, or Congress may hereafter make such provision by law as experience shall prove to be necessary.

Now it seems clearly to have been the intent of this article to confer upon Congress the power to legislate upon such matters only as were not reached by the treaty itself from causes unforeseen, and then only in their interest and to their advantage; from the wording of the article it cannot be so construed as to confer any power to legislate detrimentally to their interests.

Inasmuch as the provisions of this article are general and not specific in their character, and only intended to reach cases unforeseen and unprovided for, it must be apparent that they cannot apply to the case of the residents of Indiana, seeking through counsel to be incorporated into the tribe, who, even if they had rights, must have been overlooked, in which case they would have a specific remedy in article 2, already referred to. If not overlooked they must have been considered in the adoption of the Senate amendment to the treaty, wherein it limits the number to receive annuities, &c., with those residing in Indiana, to the corrected list of three hundred and two persons, in which case the next claim of the amendments made a full exemption from the burden, so far as the Miamies west of the Mississippi were and are concerned, in the following words: "But these amendments are in no way to affect or impair the stipulations in said treaty contained as to the Miamies west of the Mississippi," &c. Again, it can hardly be considered "to advance the interests of said Indians," to provide by law for the incorporation into their tribe, against their consent and contrary to the long-established usage of the Government toward Indian tribes, aliens

and strangers numerically sufficient to absorb at least one-half their resources.

As heretofore stated, by the treaty of 1854, at the conclusion of which, in the language of the Senate amendment, "the Miami Indians of Indiana being now represented in Washington by a fully authorized deputation," &c., all the funds of the tribe were divided, and the equitable portion of those residing in Indiana was set apart for them; so with the tribe in Kansas; but no claim was advanced by the former for any portion of the proceeds of the sale of the surplus lands in Kansas, that property being conceded by the Indiana Miamies and by the Government as belonging exclusively to the tribe in Kansas. The provisions of this treaty are clear, and appear to have been understood by all the parties thereto; but it must be remarked that while the "fully authorized deputation" from Indiana was present, and requested the Senate amendments to the same, the delegates from the tribe in Kansas were not present at the adoption of said amendments, and were not consulted herein. The following language appears in the same, to wit:

But these amendments are in no way to affect or impair the stipulations in said treaty contained as to the Miamies west of the Mississippi.

It is a noticeable fact that while the treaty itself provided for the equitable division of the funds of the tribe between the Indiana and Western Miamies, the amendments (at the adoption of which the former were present, and not the latter) contained a provision that—

No persons other than those embraced in the corrected list agreed upon by the Miamies of Indiana, in the presence of the Commissioner of Indian Affairs, in June, 1854, comprising three hundred and two names as Miami Indians of Indiana, and the increase of the families of the persons embraced in said corrected list, shall be recipients of the payments, annuities, commutation moneys, and interest hereby stipulated to be paid to the Miami Indians of Indiana, unless other persons shall be added to said list by the consent of the said Miami Indians of Indiana, obtained in council according to the custom of the Miami tribe of Indians.

Now, if this proviso means anything, it evidently means to establish the fact that the three hundred and two persons contained in the corrected list referred to were all that were left east of the Mississippi entitled to receive any of the annuities or claim any of the benefits of tribal relationship with the Miami tribe of Indians. It undoubtedly intended to settle the question of all other claimants then and thereafter, and in that settlement it pronounced them bogus.

Without this proviso no one, I apprehend, could be found even making the attempt to fasten these residents of Indiana upon the tribe in Kansas; for surely, if they belonged with the Miamies anywhere, there could have been no dispute as to which branch they naturally belonged, and hence the delegates from Indiana requested the amendment; and the Senate, aware of the illegality of adopting the same in the absence of the Kansas Miamies, appended thereto the following, to wit:

But these amendments are in no way to affect or impair the stipulations in said treaty contained as to the Miamies west of the Mississippi, &c.

The act of Congress of June 12, 1858, is offered as a precedent upon which it is proposed to pass the present bill.

This act appears to have been found as an attachment to a general supplemental appropriation bill for the Indian Department for that year, and provided that such persons of Miami blood as had been excluded from the annuities of the tribe since their removal, &c., should receive their proportion of annuities and be entered upon the pay-roll, &c. It also provides lands for each of said persons out of the common reserve in Kansas, &c., which, in the language of the treaty heretofore referred

to, was given to the Miami tribe "to remove to and settle on." (See treaty 1838.)

From the provisions hereinbefore set forth, it seems clear to me that the act of 1858 was in direct violation of the treaties of 1838, 1840, and 1854, and hence entitled to no force as a precedent. It was passed without the knowledge or consent of the tribe, and only submitted to because they had not the power to resist it. It was passed in the interest of speculators in these lands, who have made enough from the proceeds to support them to the present day, and who now appear before the Department and Congress to obtain a further share in the distribution of the remaining assets of the tribe.

Examine the records of the counties in which said lands are located, and the large share of this valuable domain wrongfully and fraudulently taken from the Miami tribe, shown to have passed through and still remaining in the hands of these self-constituted agents and lobbyists of said bogus Miamies, residents of Indiana, and the secret of their extreme interest in the passage of this bill will be revealed.

Another feature of the proposed bill, equally fatal to the interest of the Miami tribe, is contained in the following extract, to wit:

Provided, That no portion of said consolidated fund shall be paid to any members of said tribe, or person of Miami blood or descent, who has drawn annuities or money, or received allotments of land, from any other tribe or tribes of Indians, at any time since the removal of the Miami tribe of Indians to Kansas.

Now, it is well understood by this office and the Indian Bureau that an agreement was made between the Miami Indians and the Peorias, by which the two tribes were to be consolidated, under the name of Confederated Peorias and Miamies; that said tribes have knocked at the door of Congress for years, begging for a ratification of this agreement; that the Miamies were impelled to this course in part by their natural attachment to the Peorias, and of necessity because of the settlement of their lands in Kansas by white people, in violation of treaty, and from whose encroachments the Government afforded them no protection.

In anticipation of the early ratification of this agreement by Congress, a portion of said tribe did actually go to the Peorias, not supposing that by so doing (with the full knowledge of this office and the Indian Bureau) they were in any danger of losing their own rights in their own tribe, even though through the kindness of the Peorias they may have been allowed to draw annuities in advance of the proposed consolidation.

But the interest of these self-constituted lobbyists and agents of the bogus Miamies is perceptible in this as well as other provisions of the proposed bill. The more real Miamies they can exclude from participation in the assets of the tribe, and the more bogus Miamies they can include, the greater of course is their share of the spoils. They have secured the assistance of the former chief of said tribe to work in their interests, and he, of course, is provided means to visit Washington to aid in procuring the passage of the bill, and he is bitter in his complaints at the sum taken from the tribal funds by an almost unanimous vote of the tribe to pay the expenses of the delegates visiting Washington last winter to look after the interests of their people, and but for whom, undoubtedly, the obnoxious bill in question would have become a law.

The Miami matters still being in the hands of the conference committee, as the agent of the lobbyists, and former chief referred to, were preparing again to go to Washington, at the opening of Congress, the present chiefs, uneasy at the probable result of their affairs, still pend-

ing, without a representation, on behalf of the tribe, appealed to this office for permission for a duly authorized delegation of the tribe to visit Washington during the present session of Congress. This office indorsed said request, and transmitted the same to the honorable Commissioner, on the 9th ultimo, for approval. The honorable Commissioner replied, under date of November 26, "that it is not deemed necessary that a delegation of said Indians should visit this city (Washington) for the purpose indicated," &c. If it is not deemed necessary that a delegation should visit Washington for the purpose indicated, their interests should be attended to, and to insure attention some person or persons should be authorized to represent them fully cognizant of all the facts.

They are deeply interested in the legislation of the present Congress. Justice demands that their rights and their interests be protected; their treaties demand it; the present humane policy of the Government toward the Indians demands it, and I would be derelict in my duty toward the tribe if I did not, in their behalf, ask it. Expediency requires it. One of the most effectual means that I have found of reaching the wild tribes of the plains is through the semi-civilized. Deal justly with the latter at all times, acknowledge their rights, and cheerfully grant them, take no advantage by unfriendly legislation, recognize no professional leeches or designing white men as their agents, and through them the Government can always rely for aid in managing the former. In a word, rid the central superintendency of the class of men referred to, and the agents and superintendent, with the encouragement of the Department, can have a reasonable assurance of successful management of the Indians. To this end I recommend (and earnestly ask the aid of the honorable Secretary) to settle the Miami Indians at once in the Indian Territory, confederated, according to the desires of both tribes, with the Peorias. Give them the money due them from former treaties and the sale of their lands, and, if need be, reimburse them for lands fraudulently taken by the act of 1858, before alluded to. This will enable them to join the Peorias on terms of equality, and the vexed question of the Miamies will be effectually and justly settled; and the confederated tribe will be able to render valuable aid in the civilization of their wild brethren of the plains.

All of which is respectfully submitted.

Very respectfully,

ENOCH HOAG,
Superintendent Indian Affairs.

PURCHASE OF GATLING GUNS.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

An appropriation for the purchase of a limited number of Gatling guns for the use of the Army.

FEBRUARY 11, 1873.—Referred to the Committee on Appropriations and ordered to be printed.

WAR DEPARTMENT, *February 5, 1873.*

The Secretary of War has the honor to report to the House of Representatives, in answer to a letter of the Committee on Appropriations of the 25th ultimo requesting the views of the Department on the propriety of an appropriation for the purchase of a limited number of Gatling guns for the use of the Army, by transmitting to the House, for the information of said committee, copies of the reports of the Chief of Ordnance and of the board of engineers for fortifications, and to state that he concurs in the views expressed in these reports.

The letter of the Gatling Gun Company of the 24th ultimo is herewith returned.

WM. W. BELKNAP,
Secretary of War.

ORDNANCE OFFICE, *January 28, 1873.*

Respectfully returned to the Secretary of War.

Most, if not all, of the great powers of Europe have adopted some description of mitrailleuse, and the Gatling gun has met with great favor, and has been largely introduced into European service as a necessary auxiliary to the other arms of the service. The last model projected by the inventor for use with cavalry, to be transported on pack-animals, so as to accompany troops in rapid marches and in mountain districts,

seems to be most desirable for our frontier service, and it is respectfully recommended that an appropriation for the purchase of fifty of these guns be asked of Congress.

By order of the Chief of Ordnance.

S. V. BENÉT,
Major of Ordnance.

OFFICE OF BOARD OF ENGINEERS FOR FORTIFICATIONS,
ARMY BUILDING, CORNER HOUSTON AND GREENE STS.,
New York City, February 1, 1873.

GENERAL: The board of engineers for fortifications has considered the question of the introduction of a limited number of Gatling guns into our service, as referred to it by your indorsement of 30th January, 1873, upon the communication of the Committee on Appropriations of the House of Representatives to the Secretary of War, inclosing a letter of John Love, acting president of the Gatling Gun Company, asking for an appropriation for that purpose; and has now the honor to submit the following report thereon:

The Gatling gun has never been presented to this board for examination or opinion; but from our individual knowledge and from published accounts of experiments in Europe, we are inclined to believe that it has no superior—probably no equal—as a “mitrailleuse.” It could doubtless be advantageously used in our fortifications for flanking purposes and for land defense; possibly, too, for service against ships of war venturing too close with our sea-coast batteries, for throwing missiles into port-holes, or for picking off exposed men. For frontier defenses, such as block-houses, stockades, and field-fortifications for defense against an enemy without artillery, they would doubtless serve a very important part.

We do not feel prepared to recommend the purchase of any particular number of these guns, but presume that we fulfill the object of the reference to us in stating our opinion of the value of the weapon.

The papers connected with the subject are herewith returned.

Respectfully submitted.

J. G. BARNARD,
Colonel of Engineers and Brevet Major-General.
GEO. W. CULLOM,
Colonel of Engineers and Brevet Major-General.
Z. B. TOWER,
Lieutenant-Colonel of Engineers, Brevet Major-General.
H. G. WRIGHT,
Lieutenant-Colonel of Engineers, Brevet Major-General.

Official copy:

THOS. LINCOLN CASEY,
Major of Engineers.

Brigadier-General A. A. HUMPHREYS,
Chief of Engineers U. S. A., Washington, D. C.

WASHINGTON, D. C., *January 24, 1873.*

SIR: The Gatling Gun Company would respectfully petition your honorable committee to make an appropriation for supplying a limited number of Gatling guns for Army service.

The gun has been examined by military committees at home and abroad, and without exception its merits have been conceded. It is unnecessary to consume the time of your honorable committee with any argument at length, preferring to rest the claims of the gun on reports of commissions from our Army and Navy.

We would say, however, that since the reports from the commissions referred to, we have perfected a model which, firing as many shots per minute (400) as the larger guns, weighs about 125 pounds only.

This model we believe valuable for service on the plains, where a gun, easily transported on the back of a horse or mule, could accompany cavalry.

Although our Government purchased some Gatling guns under an order from the then Secretary, Mr. Stanton, yet the improvements in the details of construction have been so marked as to make the gun of to-day practically a new arm.

Our gun has now been adopted by most of the leading powers of Europe, England, Russia, Turkey, and is now being examined by the government of France.

This gun being so entirely different from all arms heretofore in use, it would seem important that it be placed at the earliest day in the hands of the soldier, that he may become expert in its manipulation. To illustrate: The sewing-machine is valueless in the hands of inexperienced operators; the art of manipulating it once acquired, its value is incalculable.

In this view we would seem to be sustained by the experience of the French with their "mitrailleuse."

Instead of putting it in the hands of troops for drill, it was carried to the front as a great mystery, and was consequently valueless until later in the war, when with more experience in its manipulation and use it proved at Gravelotte and Sedan an arm of most destructive power.

The larger calibers of Gatling guns we believe invaluable for defensive works and positions.

With the hope that our petition may meet with favorable consideration, we have the honor to be, with the highest respect, your obedient servants,

The GATLING GUN COMPANY.

By JOHN LOVE,

Vice and Acting President.

Hon. JAMES A. GARFIELD,

Chairman Committee on Appropriations.

The first of these is the fact that the United States is a young nation, and that its history is a history of growth and development. It is a history of a people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The second of these is the fact that the United States is a nation of immigrants. It is a nation of people who have come from many different parts of the world, and who have brought with them their own customs and traditions. This has made the United States a very diverse and interesting nation.

The third of these is the fact that the United States is a nation of pioneers. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The fourth of these is the fact that the United States is a nation of freedom. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The fifth of these is the fact that the United States is a nation of progress. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The sixth of these is the fact that the United States is a nation of peace. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The seventh of these is the fact that the United States is a nation of justice. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The eighth of these is the fact that the United States is a nation of hope. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The ninth of these is the fact that the United States is a nation of love. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The tenth of these is the fact that the United States is a nation of faith. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

The eleventh of these is the fact that the United States is a nation of courage. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony. It is a nation of people who have been able to overcome many difficulties and to build a great nation out of a small colony.

MODOC INDIANS.

LETTER

FROM

THE SECRETARY OF THE INTERIOR,

RELATIVE TO

The present difficulties with the Modoc Indians.

FEBRUARY 11, 1873.—Referred to the Committee on Indian Affairs and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 8, 1873.

SIR: For the information of the House of Representatives, I have the honor to transmit herewith a copy of a report, dated the 7th instant, from the Acting Commissioner of Indian Affairs, together with Senate Ex. Doc. No. 29, Forty-second Congress, third session, in answer to a resolution of the House, dated the 3d instant, in the following words, viz:

Resolved, That the Secretary of the Interior be, and he is hereby, instructed to inform the House, at his earliest convenience, of the cause of the present difficulties with the Modoc Indians.

I will remark that, as stated in the communication to the Senate on the 16th ultimo, in reply to a similar resolution of that body, there are on file in the Indian Office other papers, bearing upon this subject, that are voluminous; and it has not been deemed advisable to delay an answer to the resolution for the purpose of copying them, as their substantial import is exhibited in those now forwarded.

Very respectfully, your obedient servant,

C. DELANO,
Secretary.

Hon. JAMES G. BLAINE,
Speaker of the House of Representatives.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., February 7, 1873.

SIR: I have the honor to be in receipt, by reference from the Department, of a resolution adopted by the House of Representatives on the 3d instant, the same being in terms as follows:

Resolved, That the Secretary of the Interior be, and he is hereby, instructed to inform the House, at his earliest convenience, of the cause of the present difficulties with the Modoc Indians.

In compliance with your instructions to submit a report upon the subject-matter of this resolution, I have the honor to state, briefly, that the existing difficulties with the Modoc Indians, in Oregon, arise from the armed resistance of certain members of the tribe, under the leadership of Captain Jack, to an effort on the part of the Government to locate them on the reservation assigned for their use by the treaty concluded with them on the 14th of October, 1864, (16 Statutes at Large, p. 707.) Though a portion of the tribe, under their head chief, have remained quietly on this reservation, Captain Jack and his band, which comprises the more turbulent and lawless of the Indians, have, with the exception of a few months in 1869 and 1870, never complied with their treaty stipulations, but have persisted in living at their old home near Clear Lake, about sixty miles southeast of Klamath, where, by their petty depredations, they have been the source of continual annoyance to the settlers in the vicinity. The superintendent of Indian Affairs for Oregon reports the present attitude of defiant hostility, which these Indians now maintain toward the Government, to be, in great measure, due to the advice and influence of evil-disposed persons living at, or near, Yreka, California.

The foregoing statement contains all the information, in the possession of this Office, which bears upon the specific inquiry of the House resolution. For further information regarding these troubles, I would refer you to my report of the 14th ultimo, with papers accompanying, which appears as Senate Executive Document No. 29 of the present session of Congress, a copy of which is herewith inclosed.

The resolution of the House of Representatives is herewith returned. I have the honor to be, very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. the SECRETARY OF THE INTERIOR.

Letter from the Acting Secretary of the Interior accompanying information called for by the Senate resolution of January 8, 1873, relative to the Modoc and other Indian tribes in Northern California.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., January 16, 1873.

SIR: For the information of the Senate I have the honor to transmit herewith a copy of a report, dated the 14th instant, from the Acting Commissioner of Indian Affairs, and accompanying papers, in answer to a resolution of the Senate, dated the 8th instant, in the following words, viz:

"Resolved, That the Secretary of the Interior be directed to furnish the Senate such information as may be in his Department touching existing difficulties with the Modoc and other Indian tribes in Northern California and Southern Oregon."

It appears from the report of the Acting Commissioner that there are on file in the Indian-Office other papers, bearing upon this subject, that are voluminous; and as their substantial import is exhibited in those now presented, it has not been deemed advisable to delay an answer to the resolution for the purpose of copying them. Such copies will, however, be furnished if desired.

Very respectfully, your obedient servant,

B. R. COWEN,
Acting Secretary.

The PRESIDENT OF THE SENATE.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., January 14, 1873.

SIR: I have the honor to be in receipt, by reference from the Department, of Senate resolution of the 8th instant, the same being in terms as follows:

"Resolved, That the Secretary of the Interior be directed to furnish the Senate such information as may be in his Department touching existing difficulties with the Modoc and other Indian tribes in Northern California and Southern Oregon."

In compliance with your instructions to submit a report upon the subject-matter of this resolution, I have the honor to state that no serious difficulties are known to exist with any tribes in the sections named other than with the Modocs.

This tribe has been known to this office since 1853 as generally unfriendly to the whites. It first entered into formal relations with the Government by a treaty to which the Klamaths and Yahooskin band of Snakes were also parties, (16 Statutes at Large, p. 707,) made on the 14th day of October, 1864, ratified by the Senate, with certain verbal amendments, July 2, 1866, and, after the Indians had consented to these amendments, in December, 1869, proclaimed by the President February 18, 1870. Under the provisions of Article I of this treaty, and of the executive order of March 14, 1871, issued thereunder, a tract of land, estimated to contain 768,000 acres, was set apart for the Indians, parties to the treaty, in the southern part of Oregon.

In September, 1865, while this treaty was pending before the Senate, Mr. Lindsley Applegate, sub-agent in charge of the Klamaths and Snakes, commenced operations for their benefit. The Modocs, presumed acting under advice of certain interested whites, had previously withdrawn from the country to their former home, near Clear Lake, sixty miles southeast of Klamath. They, however, informed Mr. Applegate, by messenger, that they would conform to his wishes, and in the event of the ratification of their treaty would come on the reservation.

During the ensuing year a part of this tribe, under their head-chief "Schon-chin" or "Skin-tian," were induced to settle quietly at the agency; Captain Jack's band, however, preferring to stay at their old homes, where, without serious outbreak, they remained until 1869. In the latter part of that year the amendments of the Senate to said treaty were presented for their acceptance, when Captain Jack made strenuous objections to the whole affair. He was, however, finally induced by the other chiefs to withdraw his opposition to the treaty, and in December of that year settled with his immediate followers upon the reservation. Within three months, troubles arose between the Modocs and the Klamath, due, in great measure, to the unfriendly disposition and conduct of the latter. The Modocs, under orders from Captain O. C. Knapp, United States Army, who, in October, 1869, had relieved Mr. Applegate as sub-agent, removed to another part of the reservation. Here disturbances were soon renewed, which resulted in the departure of the Modocs, who refused, as they said, to go into any traps for the benefit of their enemies, the Klamaths. Mr. A. B. Meacham, the then superintendent of Indian affairs for Oregon, attempted to settle the difficulties by establishing at Camp Yainax, in a distant part of the reservation, a sub-agency for the Snakes and others, leaving the Klamaths alone at the regular agency. But this measure, so far as it concerned the seceding and more turbulent portion of the tribe under Captain Jack's leadership, failed of its object. In his annual report for 1871, Superintendent Meacham recommended the establishment of the band on a reservation to be set apart for them near their old home, where they could be subjected to governmental control and receive their share of the benefits of the treaty. The tract indicated by him was six miles square, lying partly in Oregon and partly in California. No action on this recommendation was ever taken by this Department.

To avert an outbreak, which the superintendent deemed imminent, two commissioners, acting under his instructions, held consultations with these Indians in the summer of 1871, as the result of which it was understood that they should be permitted to remain at their present location awaiting definite action by this office in regard to their reservation, provided always that they refrained from theft and disturbance.

By reference from the honorable the Secretary of War, this office was, on the 21st of March last, placed in possession of copies of an extended correspondence which had been conducted between the military officers, the Oregon State authorities, and the superintendent of Indian affairs in that State, in which the danger of serious troubles was set forth and acknowledged by all these officials, and from which it was apparent that the military, while disposing the troops to insure the greatest protection to the citizens, yet felt themselves restrained from active operations against the defiant Indians under the agreement made by Superintendent Meacham in regard to the reservation, although Superintendent Meacham's successor, Mr. T. B. Odeneal, held that Captain Jack had forfeited by his maraudings all claim to consideration under that agreement.

A letter of instructions relative to the whole subject at issue, and covering copies of these papers, was forwarded to Superintendent Odeneal on the 12th of April last. Upon the receipt of his reply of June 17, 1872, and its inclosures, he was, under date

of July 6, ordered to effect the removal of these Indians, by force if necessary, to the Klamath reservation.

Copies of these three communications, and of Superintendent Odeneal's communication of the 23d ultimo, in which he reports at length in regard to these difficulties, are herewith forwarded for the information of the Senate. The papers referred to this office from the War Department, with other papers bearing upon this subject, also on file in this office, are voluminous, and, as their substantial import has been shown above, it has not been thought advisable to delay this report for the purpose of making copies of them. Such copies will, however, be furnished if desired. The resolution of the Senate is herewith returned.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. the SECRETARY OF THE INTERIOR.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., April 12, 1872.

SIR: I inclose herewith copies of papers received by this Department, by reference from the honorable Secretary of War, in reference to the hostile attitude of, and apprehended trouble with, the Modoc tribe of Indians.

You are instructed to have the Modoc Indians removed, if practicable, to the reservation set apart for them under the treaty concluded with said Indians October 14, 1864; and, if removed, to see that they are properly protected from the Klamath Indians. If they cannot be removed to or kept on the reservation, you will report your views as to the practicability of locating them at some other point, and, if favorable to such location, you will give a description, by natural boundaries, if no other can be given, of the reservation that should be set aside for them.

Very respectfully, your obedient servant,

F. A. WALKER,
Commissioner.

T. B. ODENEAL, Esq.,
Superintendent Indian Affairs, Salem, Oregon.

OFFICE SUPERINTENDENT OF INDIAN AFFAIRS,
Salem, Oregon, June 17, 1872.

SIR: In answer to your letter of the 12th of April last, inclosing copies of papers from the honorable Secretary of War in reference to the hostile attitude of, and apprehended trouble with, the Modoc Indians, I have the honor to report that, in pursuance of your instructions therein contained, I at once directed Agent Dyar, of Klamath agency, and Ivon D. Applegate, commissary in charge of Camp Yainax, to meet the chiefs and head-men of said tribe of Indians, and endeavor to persuade them to go upon Klamath reservation, authorizing the assurance to be given that they should be fully protected. A council was held with said Indians on the 14th ultimo, and the result thereof is contained in the report of Mr. Applegate, a copy of which is herewith inclosed.

I referred the matter to the gentlemen named, for the reason that Mr. Applegate has for many years been intimately acquainted with these Indians, speaks their language fluently, and possesses their confidence to an extent greater than any one else.

The leaders of these Indians are desperadoes, brave, daring, and reckless, and their superior sagacity enables them to exercise full and complete control over the rest of the tribe. They have for so long a time been permitted to do as they please, that they imagine they are too powerful to be controlled by the Government, and that they can, with impunity, defy its authority. This, in my opinion, is the whole secret of their insubordination. They must in some way be convinced of their error in this respect, by such firm, decided action as will leave no doubt in their minds in regard to the fact that we intend that they shall be obedient to law and faithful to their treaty obligations. This need not, and, with proper management, will not, require the use of force. When they shall have been thus convinced, we can, with reasonable hope of success, commence the work of civilizing and christianizing them, and transforming them into peaceable, self-controlling, and self-sustaining men and women.

Unless these leaders shall in some way be restrained from pursuing the reckless, defiant course they have heretofore been permitted to pursue, all theories in regard to their advancement in civilization must fail, and there is reason to apprehend serious trouble, and perhaps war, at no distant day.

As well might we expect our own youth to grow up in the practice of Christian virtues, under the tutorship of the "road agents" of Montana, or the "guerrillas" of Mexico, as to think of instilling any good into the minds of the Modocs while under the exclusive control, as they have been, of their present leaders.

I think the most effectual way to bring about a solution of these troubles, and maintain peace, is to take the head-men into custody, and hold them at some point remote from their tribe, until they shall agree to behave themselves. We deprive white men of their liberty as a reformatory measure, and it certainly could not be considered less humane to adopt the same course with these chiefs. Not long since I had a conversation with Major Elmer Otis, who was in command of the troops in the district including these Indians, in which he expressed the opinion that all trouble with them could be settled by arresting the leaders, and compelling the others to go upon Klamath reservation. His opinion, as well as that of Messrs. Applegate and Dyar, is, that Camp Yainax, on Klamath reservation, is the best place in that whole country for the Modoc Indians; that they will be as well contented and as easily kept there as at any other place that could be selected. I agree with them in this; and therefore respectfully report against the propriety of locating them elsewhere.

I do not believe it practicable to remove them to the Klamath reservation at this season of the year without using the military for that purpose; and then, if they should resist, I doubt whether there is sufficient force in that vicinity to compel them to go. Major Otis stated in the conversation I had with him that the peremptory order for them to go upon the reservation should not be made before the last of September, for the reason that it would be difficult to enforce such order before the commencement of winter.

It is the opinion of Major Otis and other military officers and citizens that a reservation should be selected on the head-waters of Malheur River, or in the Stein Mountain country, on which the Pi-Utes (or Snakes) should be located. I believe this practicable and advisable, but await orders from you in regard to it. It is estimated that there are five hundred Pi-Utes on the head-waters of the Malheur who have never been on any reservation, and two hundred more at Yainax, who desire to go back to where their people are, in the Malheur country.

Very respectfully, your obedient servant,

T. B. ODENEAL,
Superintendent Indian Affairs, Oregon.

Hon. F. A. WALKER,
Commissioner, &c., Washington, D. C.

CAMP YAINAX, May 8, 1872.

SIR: Your communication of April 27, relative to the Modocs and their permanent location, has been received, and I reply with no little embarrassment, for this is an old and vexed question, and one upon which there is much difference of opinion; in fact, any solution of the question will have its opponents.

In regard to moving the band to Klamath reservation and protecting them from the Klamaths, I give it as my opinion that the place is not only practicable, but is really the only policy that can be adopted with any hope of success; but it is reasonable to believe that they will not come on to the reservation peaceably while their present leaders are in power; at any rate, not until they are convinced that the military will be used against them in case of refusal. I feel confident that in winter they could be removed quite easily by the troops stationed at Fort Klamath, but at this season an attempt to bring them by force might be attended with considerable danger to the settlers now in that country. Yet I am inclined to the opinion that a positive order to remove to the reservation, made when a force of fifty or sixty cavalry can be at hand in their country, ready for immediate action, would have the desired effect, and that most, if not all, of the Modocs would obey; and even this plan of action might lead to a very destructive war, for the Indians, of whom there are at least fifty active, well-armed warriors, might get into the mountains adjacent to the scattering settlements, do a great deal of damage, and really be almost invincible until hemmed in again by the snows of next winter. They are well armed and clothed, well supplied with ammunition, and are undoubtedly encouraged by certain white men in Siskiyou County, who perhaps profit by their trade. The proposition to arrest the leaders is one worthy of serious consideration, and in this plan may lie the solution of the problem; but under the present understanding between the Department, both Indian and military, and the chief, Captain Jack, the arrest would no doubt be regarded by the Indians as an act of treachery on our part, and might hereafter destroy their confidence in the Indian Department to a great extent, and the military might be averse to taking any action while they consider the agreement made with Captain Jack by the late superintendent, A. B. Meacham, as still in force. The nature of which agreement was, as

you will see by records in your office, that, until the matter of setting apart a separate reservation for them should be adopted or disapproved, and the matter of their permanent location be positively determined by the Department, they should remain unmolested in the Modoc country, they, on their part, "doing nothing that would have a tendency to cause a collision between them and the settlers."

In a communication addressed to Superintendent A. B. Meachem, under date of February 17, 1872, General E. R. S. Canby says: "The commanding officer has been advised that the question of new location has been by you submitted to the Commissioner of Indian Affairs, and that, pending the decision of this question, force will not be used by the military to compel the return of the Modocs to the reservation," unless assured that the new location idea is abandoned, perhaps the military would not [obey] the order to arrest those men. If it could be arranged, it is my opinion that the arrest of Captain Jack, Black Jim, Scar-faced Charley, Boston, and En-choaks, the medicine-man, would settle all trouble, and I am satisfied that, if properly planned and managed, with *great caution*, it can be done with no very great risk and with a comparatively small force. Only for the appearance of being a breach of faith on the part of the Department, it could have no bad influence on the other Indians. As to their location elsewhere than on the Klamath reservation, I must say, in all candor, that I cannot consider such plan is either right or practicable. Allow me here to give a few reasons for so thinking: The Modocs, as parties to the treaty of October 14, 1864, ceded to the United States the very country over which they are now roving. Their right being thus extinguished, the country was thrown open to settlement. Much of it has been located as State land, and nearly every foot of it fit for cultivation has been taken up by settlers, whose thousands of cattle, horses, and sheep, are ranging over it. The country where those Modocs are is a pastoral region, not an agricultural country; and to undertake to maintain them on a small reservation there would probably cost more than to provide for them and the Klamaths on this reservation, which is so well fitted, by its various resources, as a home for them.

These Modocs really are only a fragment of the Klamath Nation, having common sympathies, speaking the same language, and being closely intermarried with the several bands on the reservation, and if located on a new reservation a constant and annoying intercourse would be the effect; and their success in being located there, in violation of treaty stipulations, would have a demoralizing influence on the other Indians.

The white settlers are very much opposed to establishing a new reservation for this band of desperadoes, and their determined opposition would keep up a continual conflict, even though the location should be made, and likely would be sufficient to make the thing a failure in the end. Chief Skin-tian, formerly recognized as chief of all the Modocs, now an old man, still remains here with over a hundred of his tribe, still faithful to his obligations, and still anxious and hopeful that his people, who have been led away by Captain Jack, will be brought back where they belong. Through Skin-tian's people I shall immediately send word to Captain Jack, asking him to meet Mr. Dyar and I, without delay, on Lost River, and the result of the council will be reported to you as soon as possible after it occurs.

Very respectfully, your obedient servant.

I. D. APPLEGATE,
Commissary in Charge.

Hon. T. B. ODENEAL,
Superintendent Indian Affairs, Salem, Oregon.

YAINAX, May 16, 1872.

SIR: Under date of May 8 I wrote you in answer to your letter of inquiry in regard to the Modoc matter, and I would now most respectfully report further, that on the 14th instant, in company with Mr. L. S. Dyar, agent at Klamath, I met the chiefs and headmen of all the Modocs, both those under Skin-tian and Captain Jack, at the military camp on Lost River. I used every argument to induce them to return peaceably to the reservation, telling them that this was the desire of the Department; that such action would insure them all the rights and privileges now enjoyed by the other Indians on this reservation, and that they would have perfect protection against the Klamaths.

I did not think it warranted by my instructions, nor was it, in my judgment, prudent, to demand of them to return, or even to say to them that they would have to come, considering that at this season hostilities would certainly result in great loss of life and property. I was not willing to make any issue, but thought it best to leave the matter of their final settlement still open, feeling satisfied and still hoping for success, based on their good conduct, they will be more likely to remain peaceable. I asked Captain Jack if he would obey the order to come on to the reservation, but he did not answer pointedly. While he hesitated, Black Jim and several others told him in their own language that it might be dangerous to say no. Jack then said that he

would not answer the question, for it would make a "dispute." Considering all things, I did not think it best to press the question further. Jack's speech was substantially as follows:

"We are good people, and will not kill or frighten anybody. We want peace and friendship. I am well known and understood by the people of Yreka, California, and am governed by their advice. I do not want to live upon the reservation, for the Indians there are poorly clothed, suffer from hunger, and even have to leave the reservation sometimes to make a living. We are willing to have whites to live in our country, but we do not want them to locate on the west side and near the mouth of Lost River, where we have our winter camps. The settlers are continually lying about my people, and trying to make trouble."

I feel quite safe in saying that there is not much probability of any serious trouble from these Indians, as matters now stand; but if the cavalry force is ordered away before winter there will be great danger of open hostility. Any action against them in the summer will be attended with more or less danger.

One very bad feature in the matter is the fact that there is a very bitter feeling among the settlers against the Modocs. The delay in removing them has made some of the settlers almost desperate, and it is hard to reason with such people, and keep them from doing some act that might bring on a general massacre. And yet it might, perhaps, be safest to risk this, and let the matter rest till winter.

Very respectfully, your obedient servant,

I. D. APPLGATE,
Commissary in Charge.

Hon. T. B. ODENEAL,
Superintendent Indian Affairs, Salem, Oregon.

DEPARTMENT OF THE INTERIOR, OFFICE OF INDIAN AFFAIRS,
Washington, D. C., July 6, 1872.

SIR: I have received your report, dated the 17th ultimo, inclosing copies of letters from I. D. Applegate, dated, respectively, the 8th and 16th of May last, in reply to a communication from this office, dated April 12, 1872, relative to the removal of the Modoc Indians to the Klamath reservation, or the propriety of having a new reservation set apart for them.

In your report you state "that it is the opinion of Major Elmer Otis, as well as that of Messrs Applegate and Dyar, that Camp Yainax, on Klamath reservation, is the best place in that whole country for the Modoc Indians; that they will be as well contented and as easily kept there as at any other place that could be selected," and you agree with them in their opinion, and report against the propriety of locating them elsewhere. You further state that the leaders of the Modoc Indians are "desperadoes, brave, daring, reckless," and defy the authority of the Government with impunity, and that it will be necessary to arrest these leaders and convince them of their error, before any civilizing influences can be brought to bear upon the tribe.

Your recommendations, so far as the Modoc Indians are concerned, are approved, and you are directed to remove them to the Klamath reservation, peaceably if you possibly can, but forcibly if you must, at the time suggested in your report, in September next. You will exercise your discretion about making arrests of the leaders, avoiding any unnecessary violence or resort to extreme measures.

You also report that it is the opinion "of Major Otis, and other military officers and citizens, that a reservation should be selected on the headwaters of the Malheur River, or in the Stein Mountain country, on which the Pi-Utes (or Snakes) should be located. You believe this practicable and advisable, and estimate that there are five hundred Pi-Utes who have never been on any reservation, and two hundred at Yainax, who desire to go back where their people are, in the Malheur country.

In reply to this part of your report, you are directed to examine the country at the headwaters of the Malheur River, and report, by natural boundaries, a sufficient quantity of land for a suitable reservation for said Pi-Ute or Snake Indians. You will be careful not to embrace any more territory than is necessary, and not to interfere with white settlements, if there are any in that locality.

Upon receipt of such report, the matter will receive proper consideration by this office.

Very respectfully, your obedient servant,

F. A. WALKER,
Commissioner.

T. B. ODENEAL, Esq.,
Superintendent Indian Affairs, Salem, Oregon.

OFFICE SUPERINTENDENT INDIAN AFFAIRS,
Salem, Oregon, December 23, 1872.

SIR: In your letter of the 6th of July last, you directed me to remove the Modoc Indians to Klamath reservation, peaceably if I could, but forcibly if I must. For the purpose of executing this order, I left here on the 20th of November, and arrived at Klamath agency on the 25th of the same month. Learning that Captain Jack's band of Modocs was then camped on Lost River, I immediately dispatched Messenger James Brown and I. D. Applegate to said camp with the following message:

"Say to them that I wish to meet the head-men at Sink River on the 27th instant, and to talk with them. Impress upon them the importance of their meeting me. Tell them that I entertain none but the most friendly feelings for them, and that the object of the interview sought is to advance their interests and promote their welfare; that I have made ample provision for their comfortable subsistence at Camp Yainax, on Klamath reservation, and desire to have them go there and receive their proportion of the annuities; that if they will go with you to the reservation within a reasonable time, as soon as they can get ready, they shall be fairly and justly dealt with, and fully protected in all their rights against any injustice which other tribes might be disposed to do them. If they agree to go with you, say to them that they need not meet me as requested, and that I will see them at Yainax. In the event they decline to go to the reservation, you will say they must meet me at Sink River, as I desire to and must come to a positive understanding with them."

On the same day I addressed the following letter to Lieutenant-Colonel Wheaton, commanding the district of the lakes:

"OREGON SUPERINTENDENCY,
"Klamath Agency, November 25, 1872.

"SIR: I am here for the purpose of putting the Modoc Indians upon this reservation, in pursuance of an order from the honorable Commissioner of Indian Affairs, a copy of which is as follows, to wit: 'You are hereby directed to remove the Modoc Indians to Klamath reservation, peaceably if you possibly can, but forcibly if you must.' I have requested the head-men of the tribe to meet me at Sink River on the 27th instant, at which time I shall endeavor to persuade them to return to the reservation. If they shall refuse to come voluntarily, then I shall call upon you for a force sufficient to compel them to do so. They have some eighty well-armed warriors, and I would respectfully suggest that as large a force be brought to bear against them at once as you can conveniently furnish, in the event it shall be determined that they cannot be removed peaceably.

"Immediately after the conference referred to, I will inform you of the result thereof, and in the mean time I have to request that all necessary preliminary arrangements be made for concentrating the forces at your command and having them ready for active operations.

"Very respectfully, your obedient servant,

"T. B. ODENEAL,
"Superintendent Indian Affairs, Oregon.

"Lieutenant-Colonel FRANK WHEATON,
"Commanding District of Lakes, Camp Warner, Oregon."

My plan was, if they could not be removed peaceably, to bring so large a force against them as to overawe them at once, and thus insure the execution of the order without fighting.

Lost River is fifty-five miles from Klamath agency, twenty-three miles from Sink River. On the day appointed, in company with Agent L. S. Dyar, I went to the place designated for the meeting, and there met the messengers, who reported that they had been to the camp of Captain Jack's band of Modocs, and had informed the head-men of everything contained in my instructions, and, besides, had used every argument in their power to persuade them to meet me or go upon the reservation. That they peremptorily declined to do either. Captain Jack, the head-chief, made substantially the following speech:

"Say to the superintendent that we do not want to see him or to talk with him. We do not want any white man to tell us what to do. Our friends and counselors are men in Yreka, California. They tell us to stay where we are, and we intend to do it, and will not go upon the reservation. I am tired of being talked to, and am done with talking."

After fully considering and discussing the matter with Agent Dyar and Mr. Applegate, and receiving from them the positive opinion that nothing but the appearance of an armed force at their camp could have any influence whatever upon them, I concluded to call for such force, and accordingly sent Mr. Applegate to Fort Klamath, with the following letter, which I authorized him to deliver to Major John Green, commanding that post, and, if he had not sufficient authority and force to act, to forward the same to Colonel Wheaton, to wit:

"OREGON SUPERINTENDENCY,
"Sink River, November 27, 1872.

"SIR: The bearer of this, Mr. I. D. Applegate, has just returned from the camp of the Modoc Indians, and he informs me that they defiantly decline to meet me at this place, in accordance with my request, sent by him. They authorized him to say that they did not desire to see or to talk with me, and that they would not go upon Klamath reservation. In order, therefore, to carry out the instructions of the honorable Commissioner of Indian Affairs, I have to request that you furnish a sufficient force to compel said Indians to go to Camp Yainax, on said reservation.

"I transfer the whole matter to your department, without assuming to dictate the course you shall pursue in executing the order aforesaid, trusting, however, that you may accomplish the object desired without the shedding of blood, if possible to avoid it.

"If it shall become necessary to use force, then I have to request that you arrest Captain Jack, Black Jim, and Scar-faced Charley, and hold them in custody subject to my order.

"I am informed that these leaders, with only about half of their warriors, are camped near the mouth of Lost River, and if the force could be immediately sent to that place, I think they might be induced to surrender and come upon the reservation without further trouble.

"Very respectfully, your obedient servant,

"T. B. ODENEAL,
"Superintendent Indian Affairs, Oregon."

This letter was addressed to no one on the inside, but was sent to Major Green, with instructions to the bearer, Mr. Applegate, to address it to Colonel Frank Wheaton, Camp Warner, in the event Major Green had not authority and force sufficient to enable him to act. He had told me on the 26th that he had orders to act, but I did not learn to what extent. I am informed that my letter, or a copy of it, was immediately forwarded to Colonel Wheaton.

On the 28th of November, at 5 o'clock p. m., a special messenger delivered to me a letter from Major Green, a copy of which is as follows:

"HEADQUARTERS FORT KLAMATH,
"November 28, 1872.

"SIR: In compliance with your written request of yesterday, I will state that Captain Jackson will leave this post about noon to-day with about thirty men; will be at Sink River to-night, and I hope before morning at Captain Jack's camp.

"I am, sir, very respectfully, your obedient servant,

"JOHN GREEN,
"Major First Cavalry, Commanding Post.

"Mr. T. B. ODENEAL,
"Superintendent Indian Affairs."

The impression seemed prevalent among military men and some others that, on account of the weather and other adverse circumstances surrounding the Indians, they would surrender and go to the reservation as soon as they saw that there was a probability that troops would be used against them if they should refuse to go.

This force was, in my estimation, too small, and as soon as I received Major Green's letter I sent James Brown, messenger in this office, in company with a man named Crawley, who lived within a quarter of a mile of the camp of the Modocs, to notify all settlers who could be in any danger in the event of an unsuccessful engagement with the Indians that the cavalry were coming. They notified several families, who went with them to Crawley's house, arriving there at half-past twelve o'clock that night. Mr. Brown knew nothing of other settlers living below Crawley's. There were six men then with him; all were acquainted with the country; no one said anything about there being other settlers who might be in danger. Mr. Brown also says that all could have been notified easily before daylight, and if this had been done no one could have been murdered. Eleven men in all were murdered—four within three miles of where the messengers stopped on the day of the battle, four within ten miles, and three within fourteen miles the day following. I state facts only. Feeling conscious that I did everything in my power to avert all danger, and knowing that blaming others cannot bring the dead to life or relieve the anguish of surviving friends, I shall offer no words of censure against any one for the sad results.

Learning that the troops would not come by way of Sink River, I, at 1 o'clock in the morning of the 29th, went to a point on the road which they would pass some three miles distant, and there gave Captain Jackson, at his request, verbal directions in substantially the following words, viz:

"When you arrive at the camp of the Modocs, request an interview with the head-

men. Say to them that you did not come to fight, or to harm them, but to have them go peaceably to Camp Yainax, where ample provision has been made for feeding and clothing them, and where, by their treaty, they agreed to live; use every argument you can to induce them to go; portray to them the folly of fighting; talk kindly, but firmly, to them; and, whatever else you may do, I desire to urge that if there is any fighting let the Indians be the aggressors. Fire not a gun, except in self-defense, after they have first fired upon you or your men."

The troops arrived at the camp at 7 o'clock in the morning, obtained an interview, and a conversation ensued lasting three-quarters of an hour. Captain Jackson has since informed me that he repeated to them all I requested him to say, and used every argument he could to induce them to go. All proving ineffectual, he demanded of them to lay down their arms, when one of the leaders, "Scar-faced" Charley, raised his gun, and, with an oath, saying he would kill one officer to begin with, fired at Lieutenant Boutelle, who was in front of his men, shooting four bullet-holes through his coat-sleeve. The Indians all had their guns in their hands, and a general firing commenced at once on both sides. The battle lasted two hours, when the Indians escaped, but returned again in the afternoon and attacked the troops.

The murders of the citizens were all committed by five men and one woman. All can be identified. The matter being in the hands of the military, I have of course exercised no control since the battle, further than to suggest that the terms of surrender should be that they lay down their arms and go and stay upon the reservation.

I have requested, further, that the leaders be taken into custody and held subject to further orders, and that the murderers be taken charge of and delivered to the civil authorities to be dealt with according to law.

A very few individuals, who can assume a very fervent enthusiasm whenever the occasion requires it, but whose motives are supremely selfish, may say (have said in fact) that this collision might have been avoided. Ninety-nine out of every hundred men in this State who know the facts would express a different opinion—the fact of their refusing to talk with me; their peremptory refusal to go to the reservation at my request, or at the request of the military; and the final and most convincing of all other facts, the opening of hostilities against men who were endeavoring to convince them that they were their friends and desired only their welfare. The military purpose pursuing until they capture them. I believe this the only safe way to do. Should the troops return to their posts, these Indians would regard it as a defeat of the Government; their insolence and defiance would become still more intolerable, and a guerrilla warfare would be waged until every settler in that region would be murdered; and other Indians, now peaceable, seeing their success, would hasten to join them. Another result would be the most gigantic Indian war of modern times.

While residing with a Quaker agent, Mr. Harvey, of Pennsylvania, in the Osage Nation, twenty-two years ago, I became impressed with the idea, and still believe, that as a general rule Indians can be governed and controlled most successfully by peaceable means. Since that time I have resided in the immediate vicinity of Indians, and been familiar with the character of various tribes and nations, and I find that all of them, in their native condition, regard white men as their natural enemies. In this they are not altogether unreasonable, in view of the sentiment of extermination which is so prevalent on the frontiers. This idea is so firmly impressed upon their minds, that it can be eradicated only by a policy such as the Government is now pursuing, and not by this in a day or even a year. Considerable time must elapse before their prejudices can be removed and substituted by feelings of friendship and good-will toward our race. It is difficult to make them forget a wrong. They will not love their enemies. They will lie to you, but you must promise them nothing you cannot give. If you should declare that you would punish them for some short-coming and not do it, they would think much less of you, and a few repetitions would cause them to lose all faith in your promises and in you. This is a characteristic of all Indians I ever knew. They are not very truthful, but want all who deal with them to be so. They should be dealt with kindly and humanely, but more as if they were children than men, until they can be educated in the ways and habits of civilized life. The Government should faithfully perform all its promises, and as a father enforces his rules and mandates, so should they be made to fulfill their promises and agreements.

Believing, as I ever have, that many acts of injustice have, in the past, been committed against them by representatives of the Government, as well as by individual white men, all my sympathies are enlisted in their favor when I see any attempt to trample upon or disregard their rights. I can make all due allowance for the ignorance which their habits, condition, and want of opportunity to become enlightened have entailed upon them. But there are exceptions to all rules. A majority of the Modocs have, for years, been residing upon the reservation, and demeaning themselves properly, while Captain Jack, disregarding the counsel of the head-chief, Scon-chin, has persisted in roaming whithersoever he pleased, taking as many others with him as he could persuade to go. No injustice has ever been done the Modocs, that I am aware of, though they have been bad Indians in the past, having murdered helpless emigrants

passing through their country, by the score. Captain Jack and other leaders of this band are not educated in books, but for good natural common sense I believe them not inferior in intellect to ordinary white men. They are educated in all the vices of our race, and have no apparent desire for any other kind of knowledge. It is not ignorance which impels them to pursue the course they do. They know better, but, like many white men, are outlaws, having no respect for the rights of others, and being destitute of all moral principle. They boast of the number of people they have killed, (both Indians and whites.) There are enough of them to demoralize all the Indians in that part of the State, and I believe that to subdue them now is not only the most merciful and christianlike, but the only safe way to deal with them. For eight years they have been permitted to baffle and defy the Government in the course desired to be pursued for their benefit, until many Indians on the reservation, familiar with their conduct, were becoming discontented, and soon would have fled from the restraints, as they consider them, connected with living at an agency. The good of all Indians in that part of the State demanded that your order be executed without further delay. I tried to carry out your instructions peaceably. Persuasive measures proved fruitless. The military tried to effect the desired object, by both argument and intimidation. All failed. The Indians commenced hostilities, and now, I think, no terms should be made with the band which could in any way interfere with afterward arresting and removing the leaders, and the trial of the murderers. If they should consent to all go upon the reservation, and the chiefs be permitted to remain with them, there would be a repetition of these troubles at least once a year as long as there should be one of them left.

Since you first ordered these Indians to be removed, I have received many letters from citizens, some addressed to me, and some by reference from the governor, complaining of Captain Jack's band and asking for relief.

The Indians were becoming more insolent every day. When they wanted a barrel of flour or a beef, they would go and demand it of the nearest settler, who was afraid to refuse, and gave them whatever they called for. A dozen or more would go into a house, demand their supper, breakfast, or dinner, and the frightened women, not daring to refuse, would prepare the meal for them, while they lounged around on the beds, or sat and smoked by the fire. The lands had been taken by settlers under the pre-emption law, yet the Indians claimed it, and would demand and take half the hay, grain, &c., as rent.

I have sufficient evidence to satisfy me that there are a few men in Yreka, California, some sixty miles from Lost River, who are to a great extent, if not entirely, responsible for the insubordination of Captain Jack's band, and for the present trouble with them. There are several letters in existence which go to show these men have persuaded them to remain off the reservation, making them believe that they could hold the land they claim under the pre-emption law, if they would stay where they were, but that if they went to the reservation they would lose all right to it. On the evening before the battle, one of the letters I refer to was given to me by a settler, (who had found it with some others,) and is in the words and figures following :

“ YREKA, September 19, 1872.

“DEAR SIR: You will have to give me a description of the land the Indians want. If it has been surveyed, give me the town, range, section, and quarter-section. If not, make a rude plat of it, by representing the line of the lake and the line of the river, so that I can describe it.

“ Mr. Varnum, the county surveyor, will not go out, so I have to send to Sacramento to get one appointed. Send me an answer by an Indian, so that I can make their papers soon. I did not have them pay taxes yet, as I do not know whether the land is surveyed and open for pre-emption.

“ Respectfully, yours,

• “E. STEELE.

“ Mr. HENRY F. MILLER.”

Other letters which parties have promised to send me have been found, and are said to be more full and explicit than this.

The friends and counselors referred to by Captain Jack have supplied the Indians with the best of guns and an abundance of ammunition, to enable them to remain off the reservation. They will, of course, find great fault with the authorities for interfering with their customers. They have evidently made a large amount of money by their illicit traffic, and their only desire was to make more, caring nothing for the ultimate fate of the Indians. E. Steele is said to be a prominent lawyer. Among others implicated is a judge of the State court. I propose to investigate this matter fully, for my own satisfaction, whether it amounts to anything beyond or not. It is my experience that nine-tenths of the trouble with Indians in this superintendency is brought about by meddlesome white men giving them improper advice and dealing illicitly with them. We are endeavoring to put a stop to these things as fast as we can find cases which can be successfully prosecuted in the courts.

The latest news I have from the Modoc country is to the effect that there has been no fighting since the first battle, and no depredations have been committed since that time.

This may be considered an inexcusably long report, but I could not give you all the facts and my views in fewer words.

Very respectfully, your obedient servant,

T. B. ODENEAL.

Hon. F. A. WALKER,
Commissioner, &c., Washington, D. C.

○

PURCHASE OF LAND AT OMAHA, NEBRASKA.

LETTER

FROM

THE SECRETARY OF WAR,

TRANSMITTING

A draught of a bill to confirm the purchase by the Executive Department on the 8th September, 1868, of a certain tract of land at Omaha, Nebraska.

FEBRUARY 11, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT, *February 7, 1873.*

The Secretary of War has the honor to submit to the House of Representatives a draught of a bill to confirm the purchase by the Executive Department, on the 8th September, 1868, of a certain tract of land at Omaha, Nebraska, and to recommend its passage.

The property, consisting of twenty acres, was purchased by Major William Myers, quartermaster, for \$8,000, under orders of his department and division commanders.

The necessity for a depot and barracks at Omaha was approved by the then Secretary of War, Mr. Stanton, and the citizens of Omaha donated the sites, which were approved by the department commander, General C. C. Augur. On a personal examination by the General of the Army, W. T. Sherman, in 1868, he found the donated tract of forty-two acres insufficient, and a contract being at the time in existence for the erection of barracks, he authorized the purchase, at \$200 per acre, of forty more acres, which have been ever since in the occupation of the United States. On this eighty-two acres are erected valuable buildings, and the land is worth far more than the amount paid for it.

In order that the officer who made this purchase may be relieved from further responsibility, I ask for the bill speedy and favorable consideration.

A copy of a previous letter of this Department, dated January 6, 1869, to the Speaker of the House of Representatives, relative to this matter, is herewith inclosed.

WM. W. BELKNAP,
Secretary of War.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of the United States is hereby given to the purchase of a certain tract of land at Omaha, Nebraska, for which, under order of his commanding officer, Major William Myers paid the sum of \$8,000; and the accounting officers are directed to credit him, in settlement of his accounts, with the sum of \$8,000, upon the filing of satisfactory vouchers showing the payment of that sum to have been made by him under such order.

WAR DEPARTMENT, *January 6, 1869.*

The Secretary of War has the honor to submit to the House of Representatives the accompanying copies of a correspondence between the War Department and Lieutenant-General Sherman, relative to the purchase of certain land at Omaha, Nebraska, in addition to that already donated to the United States for the erection of military barracks in that city, and to recommend that, as the land in question is required for the public service, its purchase, out of any appropriation applicable to the same and subject to existing requirements of law governing the purchase of land by the United States, be authorized by Congress.

J. M. SCHOFIELD,
Secretary of War.

The SPEAKER of the House of Representatives.

C

JOHN J. CLADECK.

LETTER

FROM

THE SECRETARY OF WAR,

RELATIVE TO

The joint resolution (H. Res. 114) for the relief of John J. Cladeck, late colonel Thirty-fifth New Jersey Volunteers.

FEBRUARY 11, 1873.—Referred to the Committee on Military Affairs and ordered to be printed.

WAR DEPARTMENT, *January 10, 1873.*

The Secretary of War has the honor to report to the House of Representatives, for the information of the Committee on Military Affairs, in reply to letter of said committee of the 31st ultimo, inclosing the joint resolution (H. Res. 114) for the relief of John J. Cladeck, late colonel Thirty-fifth New Jersey Volunteers, and requesting information as to his history, record, and services, that John J. Cladeck was mustered into the military service of the United States as colonel Thirty-fifth New Jersey Volunteers, October 14, 1863.

He was tried by general court-martial July 24, 1865, and the sentence "to be dishonorably dismissed the service of the United States, and to forfeit to the United States all pay and allowances now due or to become due," promulgated in General Orders No. 112, Headquarters Department of Washington, August 12, 1865, was duly executed.

The resolution proposes to grant him pay and allowances from May 31, 1865, the date of last payment, to August 12, 1865, the date of the promulgation of his sentence, including the three months' pay proper, (nearly \$700.)

The inclosed official copy of the report of the Judge-Advocate-General, dated September 13, 1865, in answer to a reference of the case to him by the Executive, gives a succinct account of the facts in the case.

The Department cannot recommend favorable action.

WM. W. BELKNAP,
Secretary of War.

BUREAU OF MILITARY JUSTICE,
September 13, 1865.

John J. Cladeck, colonel Thirty-fifth New Jersey Volunteers, was tried by general court-martial at Washington, D. C., July 24, 1865, on a charge of conduct to the prejudice of good order and military discipline.

The first specification alleged that "said Colonel Cladeck did allow and permit George H. Moore, a citizen, to come within the limits of the Thirty-fifth New Jersey Volunteers, and to take the pay-rolls of Company G, of said regiment, and pay that company, and to deduct ten per cent. of the money due enlisted men therein, for State and local bounty, he, said Colonel Cladeck, knowing that the regiment was to be paid by the regular paymaster within a few days.

"That these payments by Moore caused such dissatisfaction among the men that they deserted to the number of nearly one hundred men."

The second specification, after repeating the facts above narrated, alleged "that Colonel Cladeck, in consequence of the privilege granted to Moore, did receive from him the sum of \$335."

The accused pleaded not guilty to the charge and specifications; was found guilty, with the exception of the words "and causing such dissatisfaction among the men that they deserted to the number of nearly one hundred."

The evidence on the trial disclosed that the accused, after having been notified by his brigade commander that his regiment would be paid off in a few days, permitted Moore to pay off some of the enlisted men of his command, all the pay due them upon the rolls, with the exception of ten per cent. deduction from the amount of local and State bounty. That Moore obtained the pay-rolls of the regiment; that men of Company G signed them; and while Moore was paying them, General Barnum, hearing of the transaction, came to the tent where Moore was operating, and put an end to the payment. That Colonel Cladeck subsequently borrowed of Moore the sum of \$335 to pay off an indebtedness to the Government, which had accrued by reason of his applying deserters' funds, in his hands, to the purchase of necessaries for his regiment, a disbursement decided by the proper authority to be unwarranted.

While the payment of the men was progressing, Colonel Cladeck passed the door of the tent, and, in answer to some complaints, told the men not to receive the money, except they were paid in full, unless they chose so to do; that he would not oblige them to take it, and that they were entitled to every cent they were mustered for.

Both Moore and the accused continually notified the men that they would be paid off within a few days.

The accused now makes application to his Excellency the President of the United States, asking that a review of his case be had, and that he be honorably discharged the service. He bases his application upon the ground that much of hearsay evidence was received upon the trial, and that the evidence was clearly insufficient to convict him. He claims that the money paid by him for the use of the regiment, out of deserters' money, in his hands, was disbursed by order of a council of administration, and that the money borrowed from Moore was all paid over to Lieutenant-Colonel Potter, paymaster United States Army, to make up his deficiency. He asks that reference be had to the papers now on file in the Adjutant and Paymaster General's Offices to prove these allegations.

Colonel Cladeck alleges that he has served as an officer in the Hungarian revolution; that, on the breaking out of this rebellion, leaving a lucrative business and his family, he enlisted as a private in a three-months regiment, and was promoted to a first lieutenantcy; that he afterwards served as a captain in the Fifth and Thirtieth New Jersey Regiments for two years, and was appointed colonel of the Thirty-fifth New Jersey, on or about the 1st of October, 1863; served in command of a brigade under Major-General W. T. Sherman, in his Mississippi campaign; that he has received a wound that has disabled him for life from pursuing his former profession; that he was engaged in all the battles and skirmishes of General Sherman's campaign in Georgia; and that, near Decatur, his regiment saved the entire army from being captured; that during the four years and four months he has been in the service, he has never before been under arrest nor absent without leave.

He concludes by saying that, in whatever light the irregular transaction of Moore may be received, he (the accused) was not guilty of any designed dereliction of duty amounting to a criminal offense.

He asks, therefore, that his sentence may be remitted so that he can return to his wife and family without disgrace.

Indorsements upon an application of Colonel Cladeck to recruit his regiment, signed by General Sprague, his brigade commander, Brigadier-General T. E. G. Ransom, and Brigadier-General J. W. Fuller, are forwarded with the letter. They speak of the great gallantry of the Thirty-fifth New Jersey, and of Colonel Cladeck, its commander, as a thorough soldier, who has won the esteem and confidence of all who have served with him.

The objections taken to the character of the evidence by the accused were not raised on the trial. The record discloses that nearly all the hearsay testimony, and there was but little of it, formed a part of the *res gesta*, and was not of a nature to materially damage his case. The evidence was sufficient to establish the fact that Moore paid off part of Company G, by permission, at least with the knowledge and consent of Colonel Cladeck, and that the accused borrowed \$333 of him.

It does not appear necessary to examine the records of the Adjutant and Paymaster General's Departments as requested; for, conceding all the facts alleged to be contained therein, the accused is still guilty of conduct greatly in violation of good order and military discipline. He was commander of a regiment, not only, but the protector and guardian of all the rights and interests of every man of his command. It was disreputable for an officer of his high rank to permit this broker to make money out of the impatience and folly of his men, and, learning of his purposes, he should have ordered him out of his regimental lines.

But he consented to the plans of Moore, knew of the fact that he was shaving the men of ten per cent. of a claim which would be paid in full within a few days, and took no steps to protect them beyond a notification that he would not compel them to accept the reduced pay. He borrowed money of this man. No matter under what pressure or for what laudable purpose he obtained it, Moore was the last man to whom he should have applied for assistance. Any business relations, within the limits of his command, with one who came there for the avowed purpose of plundering enlisted men, was disreputable.

His acquiescence in such a scheme of plunder, by neglecting to arrest the perpetrator and prevent the holders of a just claim against the Government from being robbed of any portion of it, was a violation of the obligation to those whom it was his clear duty to protect, even from the consequences of their own folly.

The record of this case, sustaining, as it does fully, the findings and sentence of the court, will not justify this Bureau in recommending the exercise of executive clemency.

J. HOLT,
Judge-Advocate-General.

To the PRESIDENT.
Official:

THOMAS M. VINCENT,
Assistant Adjutant-General.

O

EPHRAIM P. SHOWALTER.

LETTER

FROM

THE SECRETARY OF WAR,

RETURNING

The bill (H. R. 1611) for the relief of Ephraim P. Showalter.

FEBRUARY 11, 1873.—Referred to the Committee of Claims and ordered to be printed.

WAR DEPARTMENT, *February 8, 1873.*

The Secretary of War has the honor to report to the House of Representatives, for the information of the Committee on Military Affairs, as requested by letter of said committee of the 31st ultimo, that Ephraim P. Showalter was drafted in the sixth district of Indiana, September 26, 1864, and mustered into service November 16, 1864. On the 18th November, 1864, he was forwarded from rendezvous to the field, where he was assigned to Company D, Thirtieth Indiana Volunteers, with which regiment he served until July 5, 1865, when he was discharged.

The records of the acting assistant provost-marshal general's office, Indianapolis, Indiana, (now on file in the War Department,) show that Henry Wilson was placed in the naval service for two years, at Cincinnati, Ohio, December 2, 1864, as a substitute for Ephraim P. Showalter, drafted in Moral Township, Shelby County, (sixth district,) Indiana.

There is no record in the War Department of the fact and time of service rendered by Henry Wilson. The records of the Navy Department may furnish this information.

The bill (H. R. 1611) for the relief of Ephraim P. Showalter is herewith returned.

WM. W. BELKNAP,
Secretary of War.

Mr. JEREMIAH M. WILSON, on leave, introduced the following bill :

A BILL for the relief of Ephraim P. Showalter.

Whereas Ephraim P. Showalter was drafted into the service of the United States on the twenty-sixth day of September, eighteen hundred and sixty-four, for the period of one year, and on the eighteenth day of November, eighteen hundred and sixty-four,

was mustered into the service of the United States, in Company D, Thirtieth Regiment Indiana Volunteer Infantry; and whereas, on or about the second day of December, eighteen hundred and sixty-four, the said Showalter furnished, and caused to be mustered into the service of the United States, a substitute for two years, paying therefor the sum of one thousand dollars; and whereas, notwithstanding he furnished said substitute, said Ephraim P. Showalter was held to service until the 23d day of June, eighteen hundred and sixty-five: Therefore,

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Treasury be, and he is hereby, authorized and directed to pay to said Ephraim P. Showalter the sum of one thousand dollars out of any money in the Treasury not otherwise appropriated.

O

APPROPRIATIONS FOR SIOUX INDIANS.

LETTER

FROM THE

SECRETARY OF THE INTERIOR,

RELATIVE TO

A deficiency in the appropriation for the subsistence of the Sioux Indians.

FEBRUARY 13, 1873.—Referred to the Committee on Appropriations and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 13, 1873.

SIR: I have the honor to inclose herewith a copy of a communication from the Acting Commissioner of Indian Affairs, dated the 10th instant, in relation to a deficiency in the appropriation for the subsistence of the Sioux Indians. The causes which have produced this deficiency are fully set forth in the Acting Commissioner's letter, and will be seen to have been beyond the control of the Department.

The condition of this appropriation was not brought to the attention of the Department until within a very short time, and it was supposed that if the appropriations for the fiscal year ending June 30, 1874, were made flexible, as had been done in former appropriation bills, the Indian Office would have been able to meet the demands upon that fund for the remainder of the fiscal year as well as for the next year, by the exercise of proper economy. The change in the appropriation bill, however, confining expenditures to the fiscal year for which it was made, has compelled the Department to ask for this deficiency. It seems to have been the custom of the Indian Office to supply deficiencies, where any occurred, by using the new appropriation so soon as it was made. For this reason this is the first time, within my knowledge of the affairs of the Department, when a deficiency has been asked for the support of Indian tribes.

The great importance of being able to feed this powerful nation of Sioux Indians, for the remainder of this fiscal year, must be apparent to every one, and needs only to be stated in order to be appreciated. Should the means to accomplish this object be withheld, there is great danger that the peaceable relations now existing between this nation and the United States will be disturbed; and should hostilities occur, aside from the ordinary calamities to individuals, the expense of such hostil-

ities to the Government will soon very far exceed the small amount now asked for, and which, if granted, it is believed will certainly prevent the occurrences to which I have alluded.

I desire, therefore, as earnestly as I may consistently with propriety, to urge upon the attention of Congress the request herein contained.

Very respectfully, your obedient servant,

C. DELANO,
Secretary.

Hon. JAMES G. BLAINE,
Speaker of the House of Representatives.

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, D. C., February 10, 1873.

SIR: I have the honor to submit herewith a statement showing the appropriations and disbursements, in gross, that have been made annually for and on account of subsisting the Sioux Indians, under treaty made with that tribe April 29, 1868.

It will be seen from such statement that the entire amount appropriated has been expended, and that, consequently, there are no funds now at the disposal of the Department to purchase subsistence for said Indians for the remainder of the present fiscal year. The causes which have led to this deficiency, briefly stated, are as follows: It will be seen by the inclosed statement that in the first appropriation made for subsisting said Indians there was an actual deficiency of \$168,125.64, and in the second appropriation a further deficiency of \$57,531.45, making in all \$225,657.09. After deducting this amount of \$225,657.09 from the last appropriation, \$1,314,000, there was left for the present fiscal year only the sum of \$1,088,342.91. There has also been a large increase over last year in the number of Indians who are being fed at the Whetstone and Red Cloud agencies. The number fed during the last fiscal year at the Whetstone agency was never greater than about 5,000, while there are now not less than 10,000 being subsisted at that place. This increase is doubtless made up of individuals and bands that have been heretofore more or less with what are known as the "hostile Sioux." At the Red Cloud agency the number is also materially increased by reason of the northern Arapahoes and Cheyennes to the number of about 2,100 having come into that agency. The Yankton band of Sioux and the Poncas—neither of which tribes is a party to the Sioux treaty—have also been subsisted from the subsistence fund of the Sioux, as was contemplated by the Indian appropriation act of May 29, 1872.

There will be required for the subsistence of the Sioux, including the Yankton band and the Poncas, up to the 30th of June next, as near as the same can be estimated, not less than \$350,000; and as it cannot be expected that the contractors for furnishing supplies for these Indians should deliver any further stores without an assurance that they will receive pay for the same within a reasonable time, and as the only way to keep the Indians quiet and at their respective agencies is to feed them, which cannot be done unless an additional appropriation shall be made by Congress for that purpose, I have caused to be prepared, and inclose herewith, an estimate of a deficiency in the appropriation for the subsistence of the Sioux Indians until June 30, 1873, amounting to

\$350,000, and respectfully ask that the same be laid before Congress, with such favorable recommendation as the Department shall deem proper and advisable for the action of that body.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. SECRETARY OF THE INTERIOR.

Statement of appropriations and disbursements on account of the subsistence-fund for the Sioux Indians.

Periods for which appropriations and disbursements were made.	Appropriations and disbursements.	Deficiencies.

APPROPRIATIONS FOR INDIAN SERVICE IN VARIOUS STATES.

LETTER

FROM THE

SECRETARY OF THE INTERIOR,

TRANSMITTING

An estimate of appropriations required for the incidental expenses of the Indian service, in various States and Territories, for the year ending June 30, 1873.

FEBRUARY 13, 1873.—Referred to the Committee on Appropriations and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 13, 1873.

SIR: I have the honor to transmit herewith a copy of a letter from the Acting Commissioner of Indian Affairs, dated the 12th instant, inclosing a special estimate for the sum of \$40,000, or so much thereof as may be necessary, to meet deficiencies in the appropriations for the fiscal year ending June 30, 1873, on account of the incidental expenses of the Indian service in California, Utah, Nevada, Dakota, and Montana.

The necessity for this appropriation, to enable the Department to meet contingencies that may arise in the Indian service in these States and Territories, is very urgent, and I earnestly recommend that the subject may receive the favorable action of Congress.

I have the honor to be your obedient servant,

C. DELANO,
Secretary.

Hon. JAS. G. BLAINE,
Speaker of the House of Representatives.

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, D. C., February 12, 1873.

SIR: I have the honor to present herewith, for the favorable consideration of the Department, and of Congress, a special estimate for the sum of \$40,000, or so much thereof as may be necessary to meet deficien-

cies in the appropriations for the fiscal year ending June 30, 1873, on account of incidental expenses of the Indian service in California, Utah, Nevada, Dakota and Montana.

It is not possible to state the precise amount that will be required for the service in each of these States and Territories, dependent, as it is, upon contingencies that have to be provided for as they arise, but it is believed that the aggregate amount embraced in the inclosed estimate will prove a sufficiency.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. SECRETARY OF THE INTERIOR.

Estimate of appropriations required for the incidental expenses of the Indian service in various States and Territories for the year ending June 30, 1873.

For the following amounts, or so much thereof as may be necessary to meet deficiencies in the appropriations for the year ending June 30, 1873: for the general incidental expenses of the Indian service in California, \$10,000; in Utah, \$10,000; in Nevada, \$10,000; in Dakota, \$5,000; and in Montana, \$5,000; amounting in the aggregate to..... \$40,000 00

NEGROES OF THE CHICKASAW NATION.

L E T T E R

FROM

THE SECRETARY OF THE INTERIOR,

TRANSMITTING

An act passed by the legislature of the Chickasaw Nation entitled "An act to adopt the negroes of the Chickasaw Nation," &c.

FEBRUARY 13, 1873.—Referred to the Committee on Freedmen's Affairs and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 10, 1873.

SIR: I have the honor to transmit herewith copy of a communication from the Acting Commissioner of Indian Affairs, dated the 4th instant, inclosing a communication to him from Douglas H. Cooper, of the Chickasaw Nation, dated the 23d ultimo, together with a letter addressed to the President of the United States, by Cyrus Harris, governor of said nation, dated the 10th ultimo, transmitting an act of the Chickasaw legislature providing for the adoption of negroes in the Chickasaw country, referred to in the third article of the treaty with the Choctaws and Chickasaws, concluded April 28, 1866. (Statutes at Large, vol. 10, p. 769.)

A careful examination of these communications exhibits the fact that the third article of the treaty referred to remains unexecuted. Neither the Choctaws nor Chickasaws have made such rules and regulations as were contemplated in said article in regard to persons of African descent residing in their respective nations, within two years after the ratification of the aforesaid treaty. The Choctaw Nation has never, at any time, attempted the execution of this treaty in regard to said persons, and what has been done by the Chickasaw Nation was done after the expiration of the two years in which their action was limited by the treaty aforesaid.

Deeming it important that the provisions of said treaty be carried out, I have respectfully to recommend that such legislation be had during the present session of Congress, if possible, as will extend the time in all respects for the execution of the provisions of the third article of the treaty before referred to, for the term of two years from the 1st day of July, 1873.

Very respectfully, your obedient servant,

C. DELANO,
Secretary.

Hon. JAS. G. BLAINE,
Speaker U. S. House of Representatives, Washington, D. C.

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, D. C., February 4, 1873.

SIR: I have the honor to submit herewith a communication from Douglas H. Cooper, of the Chickasaw Nation, dated the 23d ultimo, together with a letter addressed to the President, by Cyrus Harris, governor of said nation, dated the 10th ultimo, transmitting an act of the Chickasaw legislature providing for the adoption of the negroes in the Chickasaw country, referred to in the third article of the treaty concluded with the Choctaw and Chickasaw Indians April 28, 1866. (Statutes at Large, vol. 14, p. 769.)

In view of the expiration of the term of two years from the ratification of the treaty, within which it is stipulated that the laws, rules, and regulations referred to in the third article of the treaty aforesaid, shall be made by the Choctaw and Chickasaw Nations, and believing it to be for the best interests of the Indians, as well as of the negroes, that the latter should remain where they now are, and that the money referred to in said article should be paid to said nations, I respectfully recommend that Congress be asked to provide by legislation that the limit to the time mentioned in said third article be extended three years from the 1st of July, 1873, or until July 2, 1876.

Very respectfully, your obedient servant,

H. R. CLUM,
Acting Commissioner.

The Hon. SECRETARY OF THE INTERIOR.

WASHINGTON, D. C., *January 25, 1873.*

SIR: I have the honor herewith to hand you a letter from Cyrus Harris, governor of the Chickasaw Nation, dated at the executive office, Tishomingo, Chickasaw Nation, January 10, 1873, and directed to the President of the United States, inclosing an act of the legislature of the Chickasaw Nation, approved on the date of said letter, entitled "An act to adopt the negroes of the Chickasaw Nation," &c., and requesting "that the President will transmit the same to Congress for such action as that honorable body may deem proper;" and I respectfully request that you will transmit the said letter and act to the President, through the honorable Secretary of the Interior, at your earliest convenience.

I am, sir, your obedient servant,

DOUGLAS H. COOPER,
Of the Chickasaw Nation.

Hon. H. R. CLUM,
Acting Commissioner, Office of Indian Affairs, Department of the Interior.

EXECUTIVE OFFICE,
Tishomingo City, Chickasaw Nation, January 10, 1873.

SIR: I have the honor to inclose a copy of an act passed by the legislature of the Chickasaw Nation, and approved this day, entitled "An act to adopt the negroes of the Chickasaw Nation," &c., and respectfully request that you will transmit the same to the Congress of the United States for such action as that honorable body may deem proper at the earliest day possible.

I am, sir, your obedient servant,

CYRUS HARRIS,
Governor of the Chickasaw Nation of Indians.

The PRESIDENT of the United States,
Washington, D. C.

AN ACT to adopt the negroes of the Chickasaw Nation, &c.

SECTION 1. *Be it enacted by the legislature of the Chickasaw Nation*, That all the negroes belonging to Chickasaws at the time of the adoption of the treaty of Fort Smith, and living in the Chickasaw Nation at the date thereof, and their descendants, are hereby declared to be adopted in conformity with the third article of the treaty of 1866, between the Choctaws, Chickasaws, and the United States: *Provided, however*, That the proportional part of the \$300,000 specified in article third of the said treaty, with the accrued interest thereon, shall be paid to the Chickasaw Nation for its sole use and benefit: *And provided further*, The said adopted negroes of the Chickasaw Nation shall not participate in any part of the said proportional part of the said \$300,000, nor be entitled to any benefit from the principal and interest on our invested funds or claims arising therefrom, nor to any part of our common domain, or the profits arising therefrom, (except the forty acres per capita provided for in the third article of the treaty of 1866,) nor to any privileges or rights not authorized by treaty stipulations: *And provided further*, That the said adopted negroes, upon the approval of this act, shall be subject to the jurisdiction and laws of the Chickasaw Nation, and to trial and punishment for offenses against them in every case just as if the said negroes were Chickasaws.

SEC. 2. *And be it further enacted*, That this act shall be in full force and effect from and after its approval by the proper authority of the United States. And all laws, or parts of laws, in conflict with this act, are hereby repealed.

Approved January 10, 1873.

CYRUS HARRIS,
Governor.

Attest:

W. H. BOURLAND,
National Secretary, Chickasaw Nation.

I do hereby certify that the above copy is a true and authenticated copy from the original now on file in my office this January 10, 1873.

W. H. BOURLAND,
National Secretary, Chickasaw Nation.

RESTORATION TO MARKET OF CERTAIN LANDS IN
MICHIGAN.

L E T T E R

FROM THE

SECRETARY OF THE INTERIOR,

RELATIVE TO

The restoration to market of certain lands in Michigan.

FEBRUARY 13, 1873.—Referred to the Committee on Public Lands and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., February 10, 1873.
